5.9.3 Service Center TEL/FAX

(1) Usage

Register telephone and fax numbers of a service center that will be displayed in help information or when a malfunction occurs.

(2) Procedure

- "Service Mode Menu screen"
Press [07 System Setting].
- "Service Mode Menu screen"
Press [02 Service Center TEL/FAX].
- "Service Center TEL/FAX Setting screen"
Press either [Service Center TEL (16)] or [Service Center FAX (16)] to be set.
- Enter the telephone number or fax number you register through the numeric buttons.

Note

- When a number is less than 16 digits, be sure to use hyphen (-) to fill up the blanks.

- Press [OK] to register the data.
Press [Cancel] to cancel updating.

5.9.4 M/C Serial Number Setting

(1) Usage

Set and display the serial number of the main body and options.

Note

- The serial number of the main body cannot be changed.

(2) Procedure

- "Service Mode Menu screen"
Press [07 System Setting].
- "Service Mode Menu screen"
Press [03 M/C Serial Number Setting].
- "Serial number setting mode screen"
Select the option, then a keyboard screen appears. Enter a serial number using the alphanumeric buttons.
- Press [OK] to register the data.
Press [Cancel] to cancel updating.

5.9.5 Setup date/type of business setting

(1) Usage

Set the starting date of the total counter that is displayed on the utility mode and the type of business of the client that the CSRC notifies.
When setting the DIPSW 16-4 to 1, the starting date of the total counter is not displayed.

(2) Procedure

- "Service Mode Menu screen"
Press [07 System Setting].
- "Service Mode Menu screen"
Press [04 Setup Date/Business Setting].
- "Setup Date/Type of Business Setting screen"
Select the type of business. Not to specify the type of business, select [Unknown].
- "Setup Date/Type of Business Setting screen"
Enter an installation date with the numeric buttons. Press [Set] to highlight the Year/Month/Date to be entered.
- Press [OK] to update data.
Press [Cancel] to cancel updating.

5.9.6 Definition change of the large-size paper in counter control

Default varies depending on the destination.

PM counter control counts 2 for 338mm or more in the sub scan direction. Cannot be changed with DIPSW

Refer to the following table about the default for each destination.

Destination	Counter	large-size count number			DIPSW initial setting
		Standard-size paper		Custom size paper/ Wide Paper	
		A3 / 11 x 17	B4 / 8 ¹ / ₂ x 14		
Japan	Total counter	1	1	1	DIPSW 4-7: 0 DIPSW 10-4: 0 DIPSW 10-3: 0
Europe	Total counter	1	1	1	DIPSW 4-7: 0 DIPSW 10-4: 0 DIPSW 10-3: 0
North America	Total counter	2	1	2 (391mm or more)	DIPSW 4-7: 1 DIPSW 10-4: 0 DIPSW 10-3: 0
Others	Total counter	2	2	2 (331mm or more)	DIPSW 4-7: 1 DIPSW 10-4: 1 DIPSW 10-3: 0

5.9.7 High coverage productivity down threshold setting

Reduce the marks on drum and the cleaning fault by decreasing the productivity and reducing the load of the cleaning blade.

The following list shows the relationship between this setting and the setting of "Setting menu" - "Function Setting" - "Individual Function Chang". See the list only as a guide.

DIPSW25-1	High coverage control	Productivity
0	Quality	100% productivity for 0 to 30% coverage, 1/2 productivity for 30 to 40%, 1/3 productivity for 40% or more
	Performance	100% productivity for 0 to 35% coverage, 1/2 productivity for 35 to 45%, 1/3 productivity for 45% or more
	None	Fixed to 100% productivity
1	Quality	100% productivity for 0 to 15% coverage, 1/2 productivity for 15 to 40%, 1/3 productivity for 40% or more
	Performance	100% productivity for 0 to 20% coverage, 1/2 productivity for 20 to 45%, 1/3 productivity for 45% or more
	None	Fixed to 100% productivity

5.9.8 Image shift when outputting the custom size print job

The shift of the image is caused depending on the size of paper when it is sent the custom size image as print Job. (The output is different from the thumbnail displayed image)

Mode	28-4 : 1	28-4 : 0
Paper size > Image	Normal	Normal
Paper size ≤ Image	Normal	Image shift

[Image]

[Normal]

[Image Shift]

5.10 Firmware Version

(1) Usage

Display the firmware version of the main body and options.

Note

- Ask the administrator of this machine whether to enhance the security or not. To enhance the security, check the firmware version and the checksum value. For rewriting the firmware, refer to [J.3.1 Usage of the USB memory ISW](#). Refer to [J.2.3.1 Firmware checksum check](#) for the method of checking the checksum value.
- When the administrator wants to enhance the security, check that the firmware version of the image control (I1) is the version (A4EU0Y0-00I1-G00-15 or later: 1250/1250P/1052, A4EU0Y0-00I1-G00-15 or later: 951) which ISO/IEC15408 certificates. If not, rewrite the firmware version to the certificated one.
- When the administrator wants to enhance the security, check that the firmware version of the IC controller (P) is the version (A4EU011-00P1-G00-15 or later: 1250/1250P/1052, A4EW011-00P1-G00-15 or later: 951) which ISO/IEC15408 certificates. If not, rewrite the firmware version to the certificated one.
- When installing the machine and upgrading the firmware version, be sure to check that the firmware version of the machine and the identification number of the user's guide are matched. If the numbers are not matched, provide the user's guide whose number corresponds to the firmware version of the machine to the administrator.
- [Image control] that is displayed on the screen represents the firmware version of the overall control board (OACB).

(2) Procedure

1. "Service Mode Menu screen"
Press [08 Firmware Version].
2. "Service Mode Menu screen"
Press [01 Firmware Version].
3. "Indication of Firmware Version screen"
Each firmware version is displayed.

5.11 CS Remote Care

5.11.1 OUTLINE

The CS Remote Care is a system that manages the main body by sending and receiving various kinds of the management data of the main body between the main body and the CS Remote Care center computer through the phone line, E-mail, or WebDAV server.

It enables the main body to call the center computer, and the center computer to inquire regularly the main body for various data.

The data handled by the CS Remote Care can be classified into the 3 following groups.

- a. Data that allow you to grasp the use conditions of the main body, such as the total count and the PM count.
- b. Data that give us the general information of when and how often an abnormality occurred with the main body.
- c. All sorts of adjustment data

Note

- When the security enhanced mode is set to ON, the use of the main body NIC is not allowed.

5.11.2 Setup procedure of the CS Remote Care (When using E-mail)

Note

- Select one of main body NIC or controller NIC to use.
Pay attention to the mail account and the DIPSW setting when selecting NIC to be used or using E-mail CS Remote Care and the mail remote notification system at the same time. For details, refer to [I.5.11.5 List of combinations of E-mail CS Remote Care and Mail remote notification system](#).
- Conduct the settings of the mail address and the mail server to be used for E-mail system of CS Remote Care beforehand. The setting methods differ depending on the used NIC as follows.
 - Main Body NIC: [Utility Menu] → [Administrator Setting] → [Network Setting] → [Machine NIC Setting] → [E-mail Initial Setting].
Or set from [E-mail Initial Setting] on [Extension for maintenance] of Web Utilities. (Refer to [I.5.11.6 Mail initial setting \(In the case of the main body NIC\)](#))
 - Controller NIC: Set [Utility Menu] → [Administrator Setting] → [Network Setting] → [Controller NIC Setting] → [CSRC Setting].
(Refer to [I.5.11.7 E-mail Initial Setting \(In the case of controller NIC\)](#))
- Conduct RAM clear for CS Remote Care first and then setup again when conducting the setup again for the main body that has been done CS Remote Care setup once. (Refer to [I.5.11.16 Initialization of RAM for CS Remote Care](#))

(1) When using E-mail (Duplex)

1. Device registration on CS Remote Care center
Pre-register the device with the application on the center side. (This step can be skipped when sending the initial connection mail from the machine to the center.) After the initial connection, in this case, register the device at the center side.)
For the device registration method at the center side, refer to the user's guide on CS Remote Care center application.
2. I/O check mode, data collection clear valid
Set [03-6] to "On (1)" from [Service mode] → [System Setting] → [Software DIPSW Setting].
3. CS Remote Care memory initialization
 1. Press [Service mode] → [State Confirmation] → [I/O Check Mode].
 2. Enter "15" with numeric keys and confirm that "015-00" appears on the screen.
 3. Press the [Access] button.
 4. Enter "98" with numeric keys and confirm that "015-98" appears on the screen.
 5. Press [Start] button and confirm that the output check display switches to "FIN".
4. CS Remote Care function ON
Set [15-5] to "On (1)" from [Service Mode] → [System Setting] → [Software DIPSW Setting].
5. Select the NIC that is used for CSRC
 1. Press [Service mode] → [System Setting] → [Software DIPSW Setting] and enter [16-7].
 2. Specify the NIC that is used.
 - On (1): Main body NIC
 - Off (0): Controller NIC

6. CS Remote Care system selection
Press [Service mode] → [CS Remote Care] → [CS Remote Care] and then [E-mail].
7. Communication method selection
Press [Duplex] on [CS Remote Care setting] screen.
8. ID code entry
 1. Press [ID code].
 2. Enter the 7-digit serviceman ID with numeric keys and press [ID code] again.
9. Press [Detail Setting] to display [E-mail (Duplex) Setting Menu] screen.
10. Basic setting
 1. Press [Basic Setting] on the [E-mail (Duplex) Setting menu] screen.
 2. Press [Center ID] and enter the center ID (5 digits).
 - The serial number that is input from [Service mode] → [System Setting] → [Serial Number Setting] appears on [Device ID].
 3. Press [Cryptogram] to make a selection to decide whether it is encrypted or not. (Default: Use Cryptogram).
 4. Press [OK].
11. Date and time setting for the CS Remote Care
 1. Press [Date and Time Setting] on the [E-mail (Duplex) Setting menu] screen.
 2. Press [Setting Time] to enter the year, month, day, and time.
 - Press [Set] to move the cursor among the year/month/day/hour/minute fields.
 3. Press [Time Zone] to enter the time zone.
 - Press [+/-] to switch plus/minus of the time zone.
 4. Press [OK].
12. Response time out setting
 1. Press [Response Timeout Setting] on the [E-mail (Duplex) Setting menu] screen.
 2. Enter the response timeout (10 minute to 1440 minutes, default: 30 minutes).
 3. Press [OK].
13. Turn on and off the power switch (SW2) of the main body.
14. Initial connection
Conduct the initial connection in one of the following steps.
 - Initial connection from the center side
Send the initial connection mail from the center side to the mail address of the machine. The initial connection completes when the machine receives the initial connection mail.
 - Initial connection from the machine
Send the initial connection mail from the machine to the center. In this case, set the E-mail address of the center on the [E-mail (Duplex) Setting Menu] → [Basic Setting] → [E-mail] and press [First Call]. In case the device pre-registration at the center side is skipped, it turns to be the temporary registered status by center receiving the initial connection mail. The initial connection is completed when the device is registered at the center side.

Note

- When the CS Remote Care related window is opened while receiving the initial connection mail from the center, the information being created is destroyed and the CS Remote Care setting screen is displayed.
- For the method of sending the initial connection mail from the center side, refer to the user's guide on CS Remote Care center application.
- Mail transmission is possible only between the center and the main body that the initial connection has been established.
- After when the initial registration is done, the center mail address is displayed on [Service mode] → [CS Remote Care] → [CS Remote Care] → [Detail Setting] → [Basic Setting] → [E-mail].
- When the transmission error occurs against the center, check the error code that appears. (Refer to [I.5.11.17 CS Remote Care error code list](#))

(2) When using E-mail (Simplex (from machine to center))

1. Device registration on CS Remote Care center
Pre-register the device with the application on the center side. (The preregistration of the device at the center side can be skipped. After the initial connection, in this case, register the device at the center side.)
For the device registration method at the center side, refer to the user's guide on CS Remote Care center application.
2. I/O check mode, data collection clear valid
Set [03-6] to "On (1)" from [Service mode] → [System Setting] → [Software DIPSW Setting].
3. CS Remote Care memory initialization
 1. Press [Service mode] → [State Confirmation] → [I/O Check Mode].
 2. Enter "15" with numeric keys and confirm that "015-00" appears on the screen.
 3. Press the [Access] button.
 4. Enter "98" with numeric keys and confirm that "015-98" appears on the screen.
 5. Press [Start] button and confirm that the output check display switches to "FIN".
4. CS Remote Care function ON
Set [15-5] to "On (1)" from [Service Mode] → [System Setting] → [Software DIPSW Setting].
5. Select the NIC that is used for CSRC
 1. Press [Service mode] → [System Setting] → [Software DIPSW Setting] and enter [16-7].
 2. Specify the NIC that is used.
 - On (1): Main body NIC
 - Off (0): Controller NIC
6. CS Remote Care system selection
Press [Service mode] → [CS Remote Care] → [CS Remote Care] and then [E-mail].
7. Communication method selection
Press [Simplex] on [CS Remote Care setting] screen.
8. ID code entry
 1. Press [ID code].
 2. Enter the 7-digit serviceman ID with numeric keys and press [ID code] again.
9. Press [Detail Setting] to display [E-mail (Simplex) Setting Menu] screen.
10. Basic setting
 1. Press [Basic Setting] on the [E-mail (Simplex) Setting menu] screen.

2. Press [Center ID] and enter the center ID (5 digits).
 - The serial number that is input from [Service mode] → [System Setting] → [Serial Number Setting] appears on [Device ID].
3. Press [E-mail] and enter the mail address of the center.
4. Press [Cryptogram] to make a selection to decide whether it is encrypted or not. (Default: Use Cryptogram).
5. Press [OK].
11. Date and time setting for the CS Remote Care
 1. Press [Date and Time Setting] on the [E-mail (Simplex) Setting menu] screen.
 2. Press [Setting Time] to enter the year, month, day, and time.
 - Press [Set] to move the cursor among the year/month/day/hour/minute fields.
 3. Press [Time Zone] to enter the time zone.
 - Press [+/-] to switch plus/minus of the time zone.
 4. Press [OK].
12. Regular send setting
 1. Press [Periodical Transmission Setting] on the [E-mail (Simplex) Setting menu] screen.
 2. Set the regular send schedule to the center.
 - Every month: Send it regularly to the center on the same date. Sent date is set at the end of the month by [End of Month].
 - Every week: Send it regularly to the center on the same time and the same day of the week.
 - Every day: Send it regularly to the center on the same time everyday.

Reference:

 - To distribute the access to the center, the default time of the periodical transmission setting after the RAM clear is calculated from the serial number.
3. Press [OK].
13. Data collecting setting
 1. Press [Collecting Data Setting] on the [E-mail (Simplex) Setting menu] screen.
 2. Select data to be collected.
 - Basic data
 - Account track data
 - Machine adjustment data
 - Coverage data
 3. Press [OK].
14. Turn on and off the power switch (SW2) of the main body.
15. Initial connection
 1. Press [Service mode] → [CS Remote Care] → [CS Remote Care] → [Detail Setting] → [Basic Setting].
 2. Press [First Call] to send the initial connection mail to the center.
 3. Once the mail sending completes normally, CS Remote Care setting screen appears. (Once the mail sending to the SMTP server normally, the registration on the machine completes.)
 4. The initial connection completes when the center receives the initial connection mail. In case the device pre-registration at the center side is skipped, it turns to be the temporary registered status by center receiving the initial connection mail. The initial connection is completed when the device is registered at the center side.

Note

 - When the transmission error occurs against the center, check the error code that appears. (Refer to [I.5.11.17 CS Remote Care error code list](#))

5.11.3 Setup procedure of the CS Remote Care (When using phone line modem)

Conduct the following procedure to set up when using phone line modem as CR Remote Care system.

Note

- Conduct RAM clear for CS Remote Care first and then setup again when conducting the setup again for the main body that has been done CS Remote Care setup once. (Refer to [I.5.11.16 Initialization of RAM for CS Remote Care](#))
- Use the Data modem of ITU-T V.34/V.32 bis/V.32 compliance, AT command compliance.

(1) When using the phone line modem

1. Device registration on CS Remote Care center
Pre-register the device with the application on the center side. (The preregistration of the device at the center side can be skipped. After the initial connection, in this case, register the device at the center side.)
For the device registration method at the center side, refer to the user's guide on CS Remote Care center application.
2. Modem connection
Turn off the power of the modem, connect the main body and the modem with a modem cable, and the modem and the wall outlet with a modular cable.
For the connection of a modular cable, refer to the instructions of the modem to be used.
3. I/O check mode, data collection clear valid
Set [03-6] to "On (1)" from [Service mode] → [System Setting] → [Software DIPSW Setting].
4. CS Remote Care memory initialization
 1. Press [Service mode] → [State Confirmation] → [I/O Check Mode].
 2. Enter "15" with numeric keys and confirm that "015-00" appears on the screen.
 3. Press the [Access] button.
 4. Enter "98" with numeric keys and confirm that "015-98" appears on the screen.
 5. Press [Start] button and confirm that the output check display switches to "FIN".
5. CS Remote Care function ON
Set [15-5] to "On (1)" from [Service Mode] → [System Setting] → [Software DIPSW Setting].
6. CS Remote Care system selection
Press [Modem] on [Service Mode] → [CS Remote Care] → [CS Remote Care].
7. ID code entry
 1. Press [ID code].
 2. Enter the 7-digit serviceman ID with numeric keys and press [ID code] again.
8. Press [Detail Setting] to display the [Modem Setting Menu] screen.
9. Basic setting

1. Press [Basic Setting] on the [Modem Setting Menu] screen.
2. Press [Center ID] and enter the center ID (5 digits).
 - The serial number that is input from [Service Mode] → [System Setting] → [Serial Number Setting] appears on [Device ID].
3. Press [Center Telephone Number] to enter the center phone number.
 - Use [P], [T], [W], [-], and so on as needed.
4. Press [Machine phone number] to enter the machine phone number.
 - Use [P], [T], [W], [-], and so on as needed.
5. Press [OK].
10. Date and time setting for the CS Remote Care
 1. Press [Date/Time Setting] on the [Modem Setting Menu] screen.
 2. Press [Setting Time] to enter the year, month, day, and time.
 - Press [Set] to move the cursor among the year/month/day/hour/minute fields.
 3. Press [Time Zone] to enter the time zone.
 - Press [+/-] to switch plus/minus of the time zone.
 4. Press [OK].
11. Modem initialization AT command entry

Note

 - **Change the initialization AT command of the modem as needed. (Normally no need to change.)**
 - **For the detail of AT command, refer to the instruction of the modem used.**
 1. Press [AT command] on the [Modem Setting Menu] screen.
 2. Press [Initial command] to enter AT command.
 3. Press [OK].
12. DIPSW setting for the CS Remote Care

Note

 - **Normally no need to change the setting, but conduct the setting as needed according to the connection environment.**
 1. Press [Software DIPSW Setting] on the [Modem Setting Menu] screen.
 2. Specify DIP-SW as needed. (Refer to [I.5.11.10 Input procedure of software DIPSW for CS Remote Care](#))
13. Turn on and off the power switch (SW2) of the main body.
14. First call execution
 1. Press [Basic Setting] on the [Modem Setting Menu] screen.
 2. Press [First Call] to start the initial transmission.
 - When the connection to the center completes successfully, the CS Remote Care setting screen appears.
 - When the transmission error occurs against the center, check the error code that appears. (Refer to [I.5.11.17 CS Remote Care error code list](#))
 - In case the device pre-registration at the center side is skipped, it turns to be the temporary registered status by center receiving the initial call. The initial connection is completed when the device is registered at the center side.

5.11.4 Setup procedure of the CS Remote Care (When using WebDAV server)

Conduct the following procedure to set up when using http communication as CR Remote Care system.

Note

- Select one of main body NIC or controller NIC to use.
- Conduct RAM clear for CS Remote Care first and then setup again when conducting the setup again for the main body that has been done CS Remote Care setup once. (Refer to [I.5.11.16 Initialization of RAM for CS Remote Care](#))
- Be sure to set the Communication setting in advance when the http proxy server is used or the authentication is required for the Web server. The setting methods differ depending on the used NIC as follows.
 - **Main Body NIC:** [Utility Menu] → [Administrator Setting] → [Network Setting] → [Machine NIC Setting] → [http Communication Setting]. Or set from [CSRC http Communication Setting] on [Extension for maintenance] of Web Utilities. (Refer to [I.5.11.8 http communication setting \(In the case of the main body NIC\)](#))
 - **Controller NIC:** Set [Utility Menu] → [Administrator Setting] → [Network Setting] → [Controller NIC Setting] → [CSRC Setting]. (Refer to [I.5.11.9 http Communication Setting \(In the case of controller NIC\)](#))

(1) When using http (Duplex)

1. Device registration on CS Remote Care center

Pre-register the device with the application on the center side. (The preregistration of the device at the center side can be skipped. After the initial connection, in this case, register the device at the center side.)

For the device registration method at the center side, refer to the user's guide on CS Remote Care center application.
2. I/O check mode, data collection clear valid

Set [03-6] to "On (1)" from [Service mode] → [System Setting] → [Software DIPSW Setting].
3. CS Remote Care memory initialization
 1. Press [Service mode] → [State Confirmation] → [I/O Check Mode].
 2. Enter "15" with numeric keys and confirm that "015-00" appears on the screen.
 3. Press the [Access] button.
 4. Enter "98" with numeric keys and confirm that "015-98" appears on the screen.
 5. Press [Start] button and confirm that the output check display switches to "FIN".
4. CS Remote Care function ON

Set [15-5] to "On (1)" from [Service Mode] → [System Setting] → [Software DIPSW Setting].
5. Select the NIC that is used for CSRC
 1. Press [Service mode] → [System Setting] → [Software DIPSW Setting] and enter [16-7].
 2. Specify the NIC that is used.
 - On (1): Main body NIC
 - Off (0): Controller NIC
6. CS Remote Care system selection

Press [http] on [Service Mode] → [CS Remote Care] → [CS Remote Care].
7. Communication method selection

Press [Duplex] on [CS Remote Care setting] screen.
8. ID code entry
 1. Press [ID code].

2. Enter the 7-digit serviceman ID with numeric keys and press [ID code] again.
 9. Press [Detail Setting] to display [http (Duplex) Setting Menu] screen.
 10. Basic setting
 1. Press [Basic Setting] on the [http (Duplex) Setting menu] screen.
 2. Press [Center ID] and enter the center ID (5 digits).
 - The serial number that is input from [Service Mode] → [System Setting] → [Serial Number Setting] appears on [Device ID]. The serial number that is input appears.
 3. Press [Web Server] and enter the URL of the Web server (Less than 255 one-byte characters)
 4. Press [Cryptogram] to make a selection to decide whether it is encrypted or not. (Default: Use Cryptogram).
 5. Press [OK].
 11. Heart Beat setting *1
 1. Press [Heart Beat Setting] on the [http (Duplex) Setting menu] screen.
 2. Press [Heart Beat Setting] to make a selection to decide whether the Heart Beat function is made valid or invalid. (Default: Enable)
 3. Press [Heart Beat Interval] to enter the transmission interval of the Heart Beats (1 minute to 256 minutes, default: 30 minutes).
 4. Press [Heart Beat Fix Send] to make a selection to decide whether the fixed time transmission of the heart beat is made enable or disable. (Default: Enable)
 5. Press [Heart Beat Fix Send Time] to enter the time for the Heart Beat transmission at the fixed time.
 6. Press [OK].
 12. Date and time setting for the CS Remote Care
 1. Press [Date/Time Setting] on the [http (Duplex) Setting menu] screen.
 2. Press [Setting Time] to enter the year, month, day, and time.
 - Press [Set] to move the cursor among the year/month/day/hour/minute fields.
 3. Press [Time Zone] to enter the time zone.
 - Press [+/-] to switch plus/minus of the time zone.
 4. Press [OK].
 13. Turn on and off the sub power switch (SW2) of the main body.
 14. First call execution
 1. Press [Basic Setting] on the [http (Duplex) Setting menu] screen.
 2. Press [First Call] to start the initial transmission.
 3. Once the initial call completes normally, CS Remote Care setting screen appears. (Once the initial connection file is stored in the Web server normally, the registration on the machine completes.)
 - The initial connection completes when the center receives the initial connection file. In case the device pre-registration at the center side is skipped, it turns to be the temporary registered status. The initial connection is completed when the device is registered at the center side.
- Note**
- **When the transmission error occurs against the center, check the error code that appears. (Refer to [I.5.11.17 CS Remote Care error code list](#))**
15. Turn on and off the sub power switch (SW2) of the main body. *2
 - *1 Heart Beat function is a function to notify that the machine being active by uploading the Heart Beat file to the registered Web server periodically. Heart Beat file contains the information of the total counter and the status.
 - *2 The Heart Beat function does not work when SW2 of the main body is not turned OFF/ON after the First Call finishes.

(2) When using http (Simplex (from machine to center))

1. Device registration on CS Remote Care center
Pre-register the device with the application on the center side. (The preregistration of the device at the center side can be skipped. After the initial connection, in this case, register the device at the center side.)
For the device registration method at the center side, refer to the user's guide on CS Remote Care center application.
2. I/O check mode, data collection clear valid
Set [03-6] to "On (1)" from [Service mode] → [System Setting] → [Software DIPSW Setting].
3. CS Remote Care memory initialization
 1. Press [Service mode] → [State Confirmation] → [I/O Check Mode].
 2. Enter "15" with numeric keys and confirm that "015-00" appears on the screen.
 3. Press the [Access] button.
 4. Enter "98" with numeric keys and confirm that "015-98" appears on the screen.
 5. Press [Start] button and confirm that the output check display switches to "FIN".
4. CS Remote Care function ON
Set [15-5] to "On (1)" from [Service Mode] → [System Setting] → [Software DIPSW Setting].
5. Select the NIC that is used for CSRC
 1. Press [Service mode] → [System Setting] → [Software DIPSW Setting] and enter [16-7].
 2. Specify the NIC that is used.
 - On (1): Main body NIC
 - Off (0): Controller NIC
6. CS Remote Care system selection
Press [http] on [Service Mode] → [CS Remote Care] → [CS Remote Care].
7. Communication method selection
Press [Simplex] on [CS Remote Care setting] screen.
8. ID code entry
 1. Press [ID code].
 2. Enter the 7-digit serviceman ID with numeric keys and press [ID code] again.
9. Press [Detail Setting] to display [http (Simplex) Setting Menu] screen.
10. Basic setting
 1. Press [Basic Setting] on the [http (Simplex) Setting menu] screen.
 2. Press [Center ID] and enter the center ID (5 digits).
 - The serial number that is input from [Service Mode] → [System Setting] → [Serial Number Setting] appears on [Device ID]. The serial number that is input appears.

3. Press [Web Server] and enter the URL of the Web server (Less than 255 one-byte characters)
 4. Press [Cryptogram] to make a selection to decide whether it is encrypted or not. (Default: Use Cryptogram).
 5. Press [OK].
 11. Heart Beat setting *1
 1. Press [Heart Beat Setting] on the [http (Duplex) Setting menu] screen.
 2. Press [Heart Beat Setting] to make a selection to decide whether the Heart Beat function is made valid or invalid. (Default: Enable)
 3. Press [Heart Beat Interval] to enter the transmission interval of the Heart Beats (1 minute to 256 minutes, default: 30 minutes).
 4. Press [Heart Beat Fix Send] to make a selection to decide whether the fixed time transmission of the heart beat is made enable or disable. (Default: Enable)
 5. Press [Heart Beat Fix Send Time] to enter the time for the Heart Beat transmission at the fixed time.
 6. Press [OK].
 12. Date and time setting for the CS Remote Care
 1. Press [Date/Time Setting] on the [http (Simplex) Setting menu] screen.
 2. Press [Setting Time] to enter the year, month, day, and time.
 - Press [Set] to move the cursor among the year/month/day/hour/minute fields.
 3. Press [Time Zone] to enter the time zone.
 - Press [+/-] to switch plus/minus of the time zone.
 4. Press [OK].
 13. Regular send setting
 1. Press [Periodical Transmission Setting] on the [http (Simplex) Setting menu] screen.
 2. Set the regular send schedule to the center.
 - Every month: Send it regularly to the center on the same date. Sent date is set at the end of the month by [End of Month].
 - Every week: Send it regularly to the center on the same time and the same day of the week.
 - Every day: Send it regularly to the center on the same time everyday.

Reference:

 - To distribute the access to the center, the default time of the periodical transmission setting after the RAM clear is calculated from the serial number.
 3. Press [OK].
 14. Data collecting setting
 1. Press [Collecting Data Setting] on the [http (Simplex) Setting menu] screen.
 2. Select data to be collected.
 - Basic data
 - Account track data
 - Machine adjustment data
 - Coverage data
 3. Press [OK].
 15. Turn on and off the sub power switch (SW2) of the main body.
 16. First call execution
 1. Press [Basic Setting] on the [http (Simplex) Setting menu] screen.
 2. Press [First Call] to start the initial transmission.
 3. Once the initial call completes normally, CS Remote Care setting screen appears. (Once the initial connection file is stored in the Web server normally, the registration on the machine completes.)
 - The initial connection completes when the center receives the initial connection file. In case the device pre-registration at the center side is skipped, it turns to be the temporary registered status. The initial connection is completed when the device is registered at the center side.
- Note**
- When the transmission error occurs against the center, check the error code that appears. (Refer to [I.5.11.8 http communication setting \(In the case of the main body NIC\)](#))
17. Turn on and off the sub power switch (SW2) of the main body. *2
 - 1* Heart Beat function is a function to notify that the machine being active by uploading the Heart Beat file to the registered Web server periodically. Heart Beat file contains the information of the total counter and the status.
 - 2* The Heart Beat function does not work when SW2 of the main body is not turned OFF/ON after the First Call finishes.

5.11.5 List of combinations of E-mail CS Remote Care and Mail remote notification system

To change a combination of E-mail CS Remote Care and Mail remote notification system, refer to this table to configure the DIPSW setting or the mail account setting.

Case	Mail remote notification system Notification system	E-mail CS Remote Care using the machine NIC E-mail used CS Remote Care	E-mail CS Remote Care using the controller NIC E-mail used CS Remote Care	Setting item	Value	Remark
1	○	○	-	"Use the mail remote notification system" of the main body NIC Web utility	Use	(*3)
				"Service Mode - Software DIPSW": 15-5 (*1)	1	
				"Service Mode - Software DIPSW": 16-7 (*2)	1	
2	○	-	○	"Use the mail remote notification system" of the main body NIC Web utility	Use	(*4)

				"Service Mode - Software DIPSW": 15-5 (*1)	1	
				"Service Mode - Software DIPSW": 16-7 (*2)	0	
3	○	-	-	"Use the mail remote notification system" of the main body NIC Web utility	Use	-
				"Service Mode - Software DIPSW": 15-5 (*1)	0	
				"Service Mode - Software DIPSW": 16-7 (*2)	0	
4	-	○	-	"Use the mail remote notification system" of the main body NIC Web utility	ON (*5)	-
				"Service Mode - Software DIPSW": 15-5 (*1)	1	
				"Service Mode - Software DIPSW": 16-7 (*2)	1	
5	-	-	○	"Use the mail remote notification system" of the main body NIC Web utility	Do not call	-
				"Service Mode - Software DIPSW": 15-5 (*1)	1	
				"Service Mode - Software DIPSW": 16-7 (*2)	0	

*1 Service Mode - Software DIPSW: 15-5 (CS Remote Care function ON, 0=OFF, 1=ON)

*2 Service Mode - Software DIPSW: 16-7 (NIC selection of E-mail CS Remote Care, 0=Controller NIC, 1=Main body NIC)

*3 Mail remote notification system and CS Remote Care using the main body NIC share the same mail account.

*4 Mail remote notification system and CS Remote Care using the controller NIC use separate mail accounts.

*5 Even when the mail remote notification system is not used, set it to "Yes" and conduct the mail initial setting.

5.11.6 Mail initial setting (In the case of the main body NIC)

Set the mail address and the mail server for the machine NIC.

Note

- E-mail initial setting can be set in the [Extension for maintenance] of Web Utilities. Refer to [E.1.3.4 Initialization for Web Utilities](#).
1. Press the [Utility/Counter].
 2. Press [Administrator Setting] → [Network Setting] → [Machine NIC Setting] → [E-mail Initial Setting]
 3. Conduct the following settings.
 - [Use E-mail System]: Select [ON].
 - [Time Zone]: Set the time zone.
 - [Trans(SMTP) Mail Server]: Set the host name of the SMTP server or IP address. When inputting the host name, set the DNS server on [Machine NIC Setting].
 - [SMTP port number]: Set the port number of the SMTP server.
 - [Trans Mail Server Timeout]: Set the timeout period (sec).
 - [New-arrival Check Interval]: Set the interval (min) for checking the new-arrivals.
 - [Receive Mail Server]: Set the IP address of the receiving mail server. When inputting the host name, set the DNS server on [Machine NIC Setting].
 - [Receive Mail Server Type]: Set the type of the receive mail server (POP3/IMAP).
 4. Press [Next] to conduct the following settings.
 - [POP3/IMAP Port Number]: Set the port number of the receive mail server.
 - [Receive Mail Account]: Set the account name.
 - [Receive Mail Password]: Set the account password.
 - [E-mail Address for Machine]: Set the E-mail address for main body NIC.
 - [POP (IMAP) before SMTP Authentication]: Make a setting to decide whether the POP (IMAP) before SMTP Authentication is used.
 5. Press [Next] to conduct the following settings.
 - [SMTP SSL Encryption]: Set whether to encrypt the SMTP communication.
 - [POP (IMAP) SSL Encryption]: Set whether to encrypt the POP (IMAP) communication.
 - [SMTP Authentication]: Set whether to use SMTP authentication or not.
 - [SMTP Authentication User ID]: Set the user ID of SMTP authentication.
 - [SMTP Authentication Password]: Set the password of SMTP authentication.
 6. Press [Test] and press [Yes] on the confirmation screen to conduct the sending and receiving test.
 7. Press [OK].

5.11.7 E-mail Initial Setting (In the case of controller NIC)

Set the mail address and the mail server for the controller NIC.

1. Press the [Utility/Counter].
2. Press [Administrator Setting] → [Network Setting] → [Controller NIC Setting] → [CSRC Setting].
3. Conduct the following settings.
 - [CSRC Send Setting]: Select [Enable].

- [SMTP Server Address]: Select the address specifying method (IPv4/IPv6/host name) and press [SMTP Server Address] to set the server address. When inputting the host name, set the DNS server on [TCP/IP Setting] in [Controller NIC Setting].
 - [Port Number]: Set the port number of the SMTP server.
 - [Administrator From Address]: Set the E-mail address for the controller NIC used for CSRC.
 - [Connection Timeout]: Set the time-out period (sec).
 - [Authentication Setting]: Set the enable/disable of POP before SMTP or SMTP Authentication.
 - [POP before SMTP Time]: Set the time period from connecting to the POP server with the POP before SMTP Authentication to connecting to the SMTP server.
4. Press [Next] to conduct the following settings.
 - [SMTP Authentication Setting]: Set the User ID, Password, and realm for the SMTP Authentication.
 5. Press [Next] to conduct the following settings.
 - [CSRC Receive Setting]: When using E-mail duplex, select [Enable].
 - [POP Server Address]: Select the address specifying method (IPv4/IPv6/host name) and press [POP Server Address] to set the server address. When inputting the host name, set the DNS server on [TCP/IP Setting] in [Controller NIC Setting].
 - [Login Name]: Set the account name.
 - [Password]: Set the account password.
 - [APOP Authentication]: Set the enable/disable of APOP Authentication.
 - [Port Number]: Set the port number of the POP server.
 - [Connection Timeout]: Set the time-out period (sec).
 - [Auto Receive Check]: Select [Enable] normally. Select [Disable] to stop the auto receive check temporarily when the POP server is down and so on. When [Disable] is selected, the mail cannot be received manually.
 - [Polling Interval]: Set the polling interval (min).
 6. Press [CSRC Communication Test] on [CSRC Setting] screen to conduct the test.
 7. Press [OK].

5.11.8 http communication setting (In the case of the main body NIC)

Be sure to set the following settings when the http proxy server is used or the authentication is required for Web server.

Note

- **http communication setting can be set in the [Extension for maintenance] of Web Utilities. Refer to [E.1.3.4 Initialization for Web Utilities](#).**
1. Press the [Utility/Counter].
 2. Press [Administrator Setting] → [Network Setting] → [Machine NIC Setting] → [http Communication Setting].
 3. Conduct the following settings.
 - [Enable Proxy Server]: Select whether to use the proxy server or not.
 - [Proxy Server Address]: Set the host name of the proxy server or IP address. When inputting the host name, set the DNS server on [Machine NIC Setting].
 - When the proxy server authentication is required, follow the procedures below.
(Ex.) When the proxy server name: www.example.com, user name: user and password: password, enter "user:password@www.example.com".
 - Proxy Server Port: Set the port number of the proxy server.
 - [Enable SSL]: Set whether to use SLL or not.
 - [Enable Authentication]: Set whether to use the Web server authentication or not.
 - [Authentication User Name]: Set the user name of the Web Server authentication.
 - [Authentication Password]: Set the password of the Web Server authentication.
 4. Press [OK].

5.11.9 http Communication Setting (In the case of controller NIC)

Be sure to set the following settings when the http proxy server is used or the authentication is required for the Web server.

1. Press the [Utility/Counter].
2. Press [Administrator Setting] → [Network Setting] → [Controller NIC Setting] → [CSRC Setting].
3. Press [Next] 3 times to conduct the following settings.
 - [Proxy Server Setting]: Select whether to use the proxy server or not.
 - [Proxy Server Address]: Select the address specifying method (IPv4/IPv6/host name) and press [Proxy Server Address] to set the server address. When inputting the host name, set the DNS server on [TCP/IP Setting] in [Controller NIC Setting].
 - When the proxy server authentication is needed, set as following.
(Example) In the case of Proxy Server Name: www.example.com, User Name: user, Password: password, enter "user:password@www.example.com".
 - [Proxy Server Port Number]: Set the port number of the proxy server.
 - [SSL Setting]: Set the enable/disable of SSL Encryption.
 - [Enable Authentication]: Set whether to use Web Server authentication or not.
 - [Authentication User Name]: Set the user name of the Web Server authentication.
 - [Authentication Password]: Set the password of the Web Server authentication.
4. Press [OK].

5.11.10 Input procedure of software DIPSW for CS Remote Care

Note

- **DIPSW bits data are written into the NVRAM board (NRB) every time a change is made. In case you changed bit data by accident, be sure to restore the previous state.**

Input procedure

1. Enter the service mode.
2. Press [CS Remote Care] → [CS Remote Care] on [Service Mode menu] screen.
3. Press [ID Code] on [CS Remote Care setting] screen.
4. Enter the 7-digit serviceman ID with numeric keys and press [ID code] again.
5. Press [Detail setting].
6. Press [Software DIPSW Setting] on the Utility menu screen.
7. Select the DIPSW number on "Software DIPSW Setting."

- Use the left arrow key or the numeric keys.
8. Select the DIPSW bit number.
- Use the left arrow key or the numeric keys.
9. Select [ON (1)] or [OFF (0)].
10. Press [Return] to return to the "Setting menu screen."

Note

- About functions of each switch, refer to [.I.5.11.11 List of software DIPSW for CS Remote Care](#)

5.11.11 List of software DIPSW for CS Remote Care

5.11.12 Setup confirmation

1. Enter the service mode.
2. Press [CS Remote Care] → [CS Remote Care] on [Service Mode menu] screen.
3. Make sure that only selected item "E-Mail", "Modem", or "http" is displayed on the "CS Remote Care setting screen".

5.11.13 Maintenance call

As the CE starts the maintenance, enter the ID code of CE (7-digit number with which each CE is identified, managed by a distributor.) to notify the center the start of maintenance. After the maintenance, pressing [Maintenance Comp] notifies the center the completion of maintenance.

At the start of maintenance

1. Enter the service mode.
 2. Press [CS Remote Care] → [CS Remote Care] on [Service Mode menu] screen.
 3. Press [ID Code] on [CS Remote Care setting] screen.
 4. Enter the 7-digit serviceman ID with numeric keys and press [ID code] again.
- * During the maintenance, [Start] button blinks until the completion of the maintenance.

At the end of maintenance

1. Enter the service mode.
2. Press [CS Remote Care] → [CS Remote Care] on [Service Mode menu] screen.

3. Press [Maintenance Comp] on the "CS Remote Care setting screen."

5.11.14 Center call from administrator

If the setup of CS Remote Care is completed, the manager can call the center of CS Remote Care.

1. Press [Utility/Counter] button.
2. Press [Administrator Setting] → [System Connection] → [Administrator Call] on [Utility] screen.
3. Press [Start] on [Administrator Call] screen.
 - If the setup is not completed, or if other call is made, [Start] is grayed out, disabling to make a call.

About how to call the center and send various data of the main body on the specified date and time, refer to the manual of CS Remote Care center.

5.11.15 Confirm communication log

You can output and confirm the communication log.

1. Enter the service mode.
2. Press [List Output] on the "Service Mode menu" screen.
3. Press [Communication Log List] on the "List Output screen."
4. Press [Print Mode].
5. Press start button to output the selected list.

For details of logs, refer to [.I.5.7 List Output](#)

5.11.16 Initialization of RAM for CS Remote Care

Initializing the RAM for CS Remote Care enables you to perform the setup again.

1. Enter the service mode.
2. Press [CS Remote Care] → [CS Remote Care] on [Service Mode menu] screen.
3. Press [ID Code] on [CS Remote Care setting] screen.
4. Enter the 7-digit serviceman ID with numeric keys and press [ID code] again.
5. Press [Detail setting].
6. Press [RAM Clear] button on Utility screen.
7. Press [Execute] on "RAM Clear Setting" screen.
8. Press [Yes] on the confirmation screen.
9. The RAM is cleared, and the "CS Remote Care setting screen" is displayed.
10. Perform the setup again if necessary.

5.11.17 CS Remote Care error code list

Classification	Error Code	Description	Troubleshooting procedure
Connection via modem	K-0000	Connection NG (Cannot connect from the modem, timed out).	Redial.
	K-0001	Error code that may occur when a transmission is made from the main body to the center. No response (After connection, no start telegram from the center detected).	Redial and wait for re-reception.
	K-0002	Copying. Could not be written in non-volatile memory, and line disconnected.	
	K-0003	Error code that may occur when a transmission is made from the main body to the center. Center ID mismatch.	Confirm the center ID.
	K-0004	Serial number mismatch.	Confirm the serial number.
	K-0005	Error code that may occur when a transmission is made from the main body to the center. Syntax error (when receiving undefined commands or parameters)	Redial.
	K-0006	Received a write order for an unwritable item.	
	K-0007	Unread item error.	
	K-0008	Error code that may occur when a transmission is made from the main body to the center. Signal reception time out after a response detection (after the start telegram shuttled).	Redial.
	K-0009	Error code that may occur when a transmission is made from the main body to the center. Already registered serial number.	

Classification	Error Code	Description	Troubleshooting procedure
	K-0010	Error code that may occur when a transmission is made from the main body to the center. Communication error occurred because of the carrier OFF (NO CARRIER detected in the modem).	Redial.
	K-0011	Error code that may occur when a transmission is made from the main body to the center. Dial tone (NO DIALTONE) detected in the modem.	
	K-0012	Error code that may occur when a transmission is made from the main body to the center. Busy signal (BUSY) detected in the modem.	
	K-0013	Error code that may occur when a transmission is made from the main body to the center. NO ANSWER detected in the modem.	
	K-0014	Error code that may occur when a transmission is made from the main body to the center. Telegram error (irregular telegram received in response to the telegram you sent).	Retry standard times, and redial.
	K-0015	Serial number not registered in the center (4 x 40 telegrams received).	
	K-0016	Error code that may occur when a transmission is made from the main body to the center. Errors not defined in K-0000 to 0015.	Redial.
	K-0017	Error code that may occur when a transmission is made from the main body to the center. Telephone number you must call was not registered.	
	K-0100	Error code that may occur when a transmission is made from the main body to the center. DSR turned OFF or remains turned OFF.	
	K-0101	Error on creating a message queue.	
	K-0102	Error on generating a task.	
	K-0103	Error code that may occur when a transmission is made from the main body to the center. Error on sending a message.	
	K-0104	Error code that may occur when a transmission is made from the main body to the center. Error on receiving a message.	
	K-0105	Error code that may occur when a transmission is made from the main body to the center. Received an error (NG) from the timer task.	
	K-0201	Error code that may occur when a transmission is made from the main body to the center. Modem initialization NG.	
	K-0300	Error code that may occur when a transmission is made from the main body to the center. Center call evacuation buffer is full. Cannot evacuate any more.	
Connection via E-mail/ http	K-0590	Because of (E-mail/http) memory shortage, unable to secure enough area for sending a mail.	

Classification	Error Code	Description	Troubleshooting procedure
	K-0592	(E-mail/http) Controller in operation: unable to send a mail because the controller is in operation.	In the manual transmission, retry when the controller is idling. In the auto transmission, an automatic retry is performed after 1minute.
	K-0593	Sending error: (E-mail) Error comes back from the mail server. (http) Storing mail to Web server fails.	In the auto transmission, an automatic retry is performed after the specified time. Check if there is no fault in the network environment and the network settings.
	K-0594	(E-mail/http) Machine in operation: unable to send a mail because the machine is in operation.	In the manual transmission, retry when the machine is idling. In the auto transmission, an automatic retry is performed after 1minute.
	K-0595	(E-mail/http) Controller not connected: unable to send a mail because the controller is not connected.	Check the connection between the controller and the main body.
	K-0596	(E-mail/http) Controller-driven SC: unable to send a mail because of a controller-driven SC (49-xx).	If there is the controller-driven SC, a mail cannot be sent through the controller. Use a telephone. This error does not occur with the main body NIC.
	K-0597	(E-mail/http) No reply from controller	
	K-0600	(http) Fails to make the directory on Web server	

5.11.18 TROUBLESHOOTING

Check the followings when the main body does not receive the initial connection mail or does not return a response.

1. The center ID or the machine ID are not set in the main body.
2. The center ID or the machine ID are different (A machine ID error is not returned at the initial connection).
3. CS Remote Care function is disabled, or the phone line is selected in the CS Remote Care function selection.
4. Communication between the main body and the mail server is not proper (Check it with a transmission test).

5.12 ISW

Refer to "J Rewriting of firmware"

5.13 Finisher adjustment

5.13.1 FS-532 Staple Position Adjustment (staple finisher (main) adjustment)

(1) Functions

Adjust the staple position while in stapling by FS.

The staple pitch can be adjusted by adjusting the stop position of the stapler movement motor (M14) in this setting.

(2) Usage

Conduct this adjustment when the staple position is not within the standard value by FS.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [01 Stapler(Main) Adjustment].
3. "Staple Finisher(Main) Adjustment Menu screen"
Press [01 Staple Position Adjustment].
4. "Staple Position Adjustment screen"
Select the Staple Mode to be adjusted from [2 Position Pitch(120mm)], [2 Position Pitch(140mm)], [2 Position Pitch(165mm)], [Rear Diagonal], [Rear Parallel] and [Front Parallel]. Then press [Print Mode].
5. Set the A3 paper and press the Start key to output the test pattern (No.16).
6. Check the Staple position "a" of the output paper in accordance with the selected Staple Mode.
 - For [2 Position Pitch(120mm)], [2 Position Pitch(140mm)] and [2 Position Pitch(165mm)]
Standard value: a = 120, 140, 165 ± 3mm

- For [Rear Parallel]
Standard value: a = 19.6 ± 2mm

- For [Rear Diagonal]
Standard value: $a = 15.2 \pm 3\text{mm}$

- For [Front Parallel]
Standard value: $a = 6.4 \pm 3\text{mm}$

- When the value is not within the standard value, press [Close].
- "Staple Position Adjustment screen"
Enter a value through the numeric buttons and press [SET].
Range ([2 Position Pitch(120mm)], [2 Position Pitch(140mm)] and [2 Position Pitch(165mm)]): -5 (narrower) to +5 (wider)
Range ([Rear Diagonal], [Rear Parallel] and [Front Parallel]): -5 (in front) to +5 (in back)
1 step = 1.0mm
- Repeat steps 4 to 8 until the standard value can be obtained.

5.13.2 FS-532 Staple Paper Width Adjustment (staple finisher (main) adjustment)

(1) Function

Changes the CD Alignment Plate width of the staple bundle.

The paper width and the alignment width can be set by changing the driving amount of the stacker alignment motor (M9) in this adjustment.

(2) Usage

Conduct this adjustment when there is a misalignment in the main scan direction in a bundle of paper while in stapling by FS.

(3) Procedure

- "Service Mode Menu screen"
Press [11 Finisher Adjustment].
- "Service Mode Menu screen"
Press [01 Stapler(Main) Adjustment].
- "Staple Finisher(Main) Adjustment Menu screen"
Press [02 Staple Paper Width Adjustment].
- "Staple Paper Width Adjustment screen"
Press [▼] or [▲], and select [All].
- Press [Print Mode].
- Set paper in A4 size on the tray and press the Start key to output the test pattern (No.16).
- Check the misalignment "a" of the output paper in the main scan direction.
Standard value: $a = \pm 1.0\text{mm}$ or less

The paper is stacked on the stacker and stops in the following conditions.

- CD alignment plate: Closed
- FD alignment plate: Closed
- Rewind paddle: Descent

Check the alignment. For the target value of the adjustment, refer to the followings.

- The interval between the paper and the CD alignment plate: 0mm
- The interval between the paper and the FD alignment plate: -2mm (shorter with reference to the paper length)
- The contact area between the paper and the rewind paddle: 2mm (the paper being pressed)

When adjusting, remove the stacked paper and perform the initial operation by opening and closing the front door of the finisher.

Note

• When the operation stops due to the paper lack or jam during printing, be sure to perform the initial operation by opening and closing the front door.

• For the adjustment, be sure to conduct [I.5.13.2 Staple Paper Width Adjustment \(staple finisher \(main\) adjustment\)](#), [I.5.13.3 FS-532 FD Alignment Plate Adjustment \(staple finisher \(main\) adjustment\)](#), [I.5.13.5 FS-532 Rewind Paddle Descent Adjustment \(staple finisher \(main\) adjustment\)](#) in order.

• If the size of the paper to be adjusted exceeds 230mm, the FD alignment plate moves to the standby position because the paper is too long. Be careful that the paper jam possibly occurs at the paper exit section if the stacker is pulled out in this condition.

- When the value is not within the standard value, press [Close].
- "Staple Paper Width Adjustment screen"
Enter the setting data through the numeric buttons and press [Set].
Range: -20 (wider) to +20 (narrower)
1 step = 0.1mm
- Repeat steps 5 to 9 until the standard value can be obtained.

5.13.3 FS-532 FD Alignment Plate Adjustment (staple finisher (main) adjustment)

(1) Function

Adjust the pushing of the FD alignment plate for the stacker while in alignment.

The amount of a bundle of paper which pushed by the FD alignment part can be adjusted by changing the driving amount of the small size paper alignment motor (M18) in this adjustment.

(2) Usage

Conduct this adjustment when there is a misalignment in the sub scan direction in a bundle of paper while in stapling by FS for the paper whose length in the sub scan direction is 230mm or more.

(3) Procedure

- "Service Mode Menu screen"
Press [11 Finisher Adjustment].
- "Service Mode Menu screen"
Press [01 Stapler(Main) Adjustment].
- "Staple Finisher(Main) Adjustment Menu screen"
Press [03 FD Alignment Plate Adjustment].
- "FD Alignment Plate Adjustment screen"
Press [▼] or [▲], and select [All].
- Press [Print Mode].
- Set paper in A4 size on the tray and press the Start key to output the test pattern (No.16).
- Check the misalignment "a" of the output paper in the sub scan direction.
Standard value: $a = \pm 1.0\text{mm}$ or less

The paper is stacked on the stacker and stops in the following conditions.

- CD alignment plate: Closed

- FD alignment plate: Closed
- Rewind paddle: Descent

Check the alignment. For the target value of the adjustment, refer to the followings.

- The interval between the paper and the CD alignment plate: 0mm
- The interval between the paper and the FD alignment plate: -2mm (shorter with reference to the paper length)
- The contact area between the paper and the rewind paddle: 2mm (the paper being pressed)

When adjusting, remove the stacked paper and perform the initial operation by opening and closing the front door of the finisher.

Note

• When the operation stops due to the paper lack or jam during printing, be sure to perform the initial operation by opening and closing the front door.

• For the adjustment, be sure to conduct [I.5.13.2 FS-532 Staple Paper Width Adjustment \(staple finisher \(main\) adjustment\)](#) , [I.5.13.3 FD Alignment Plate Adjustment \(staple finisher \(main\) adjustment\)](#), [I.5.13.5 FS-532 Rewind Paddle Descent Adjustment \(staple finisher \(main\) adjustment\)](#) in order.

• If the size of the paper to be adjusted exceeds 230mm, the FD alignment plate moves to the standby position because the paper is too long. Be careful that the paper jam possibly occurs at the paper exit section if the stacker is pulled out in this condition.

- When the value is not within the standard value, press [Close].
- "Staple Paper Width Adjustment screen"
Enter the setting data through the numeric buttons and press [Set].
Setting range: -50 (wider) to +50 (narrower)
1 step = 0.1mm
- Repeat steps 5 to 9 until the standard value can be obtained.

5.13.4 FS-532 Exit Guide Unit Paper Width Adjustment (staple finisher (main) adjustment)

(1) Function

Adjust the position of the exit alignment plate (front and back) while in paper exit alignment.

The alignment intervals of the paper exit alignment plate can be adjusted by changing the driving amount of the paper exit alignment plate motor (M12) in this adjustment.

(2) Usage

Adjust an uneven paper stack (main scanning direction) on the main tray in non-staple mode by the FS.

Note

- This adjustment is effective only for paper more than 182mm width (B5S) in the main scan direction in the straight exit, or paper more than 210mm width (A4) in the shift exit. This adjustment is invalid for paper of minimum size (A5S, B6S, 5¹/₂ x 8¹/₂S) since it does not operate the paper exit alignment.

(3) Procedure

- "Service Mode Menu screen"
Press [11 Finisher Adjustment].
- "Service Mode Menu screen"
Press [01 Stapler(Main) Adjustment].
- "Staple Finisher(Main) Adjustment Menu screen"
Press [04 Exit Guide Unit Paper Width].
- "Exit Guide Unit Paper Width Adjustment screen"
Press [▼] or [▲] to select the paper size that you want to adjust.
- Press [Print Mode].
- Select the paper size according to the item that you want to adjust and press the Start key to output some test pattern (No.16).
- Check the misalignment "a" of the stacked paper.

Note

- Check the misalignment between exit paper and the exit alignment plate under the operation as a reference for the adjustment.
- Too narrow adjustment causes an uneven paper exit in the sub scan direction.

The paper is stacked on the main tray and stops while the paper exit alignment plate is closed.

Check the alignment. For the target value of the adjustment, refer to the followings.

- The interval between the paper and the paper exit alignment plate: 0mm

When adjusting, remove the stacked paper and perform the initial operation by opening and closing the front door of the finisher.

Note

• When the operation stops due to the paper lack or jam during printing, be sure to perform the initial operation by opening and closing the front door.

- Press [Close] to adjust the position of the paper exit alignment plate.
- "Exit Guide Unit Paper Width Adjustment screen"
Enter the setting data through the numeric buttons and press [Set].

Setting range: -50 (wider) to +50 (narrower)

1 step = 0.1mm

Adjustment standard value (at the alignment operation): Paper width 0mm to +1mm

10. Repeat the steps 4 to 9 until an appropriate value is obtained.

5.13.5 FS-532 Rewind Paddle Descent Adjustment (staple finisher (main) adjustment)

(1) Functions

Adjust the rewind paddle descent (time) in stacking.

The alignment intervals in the FD direction can be adjusted by adjusting the stop position of the rewind paddle release motor (M28) in this adjustment.

(2) Usage

When there is a misalignment in FD direction, conduct this adjustment.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [01 Stapler(Main) Adjustment].
3. "Stapler(Main) Adjustment menu screen"
Press [05 Rewind Paddle Descent Adjustment].
4. "Rewind Paddle Descent Adjustment screen"
Press [▼] or [▲], and select [All].
5. Press [Print Mode].
6. Set paper in A4 size on the tray and press the Start key to output the test pattern (No.16).
7. Check the misalignment "a" of the output paper in the sub scan direction.
Standard value: $a = \pm 1.0\text{mm}$ or less

The paper is stacked on the stacker and stops in the following conditions.

- CD alignment plate: Closed
- FD alignment plate: Closed
- Rewind paddle: Descent

Check the alignment. For the target value of the adjustment, refer to the followings.

- The interval between the paper and the CD alignment plate: 0mm
- The interval between the paper and the FD alignment plate: -2mm (shorter with reference to the paper length)
- The contact area between the paper and the rewind paddle: 2mm (with the paper being pressed)

When adjusting, remove the stacked paper and perform the initial operation by opening and closing the front door of the finisher.

Note

• When the operation stops due to the paper lack or jam during printing, be sure to perform the initial operation by opening and closing the front door.

• For the adjustment, be sure to conduct [1.5.13.2 FS-532 Staple Paper Width Adjustment \(staple finisher \(main\) adjustment\)](#) , [1.5.13.3 FS-532 FD Alignment Plate Adjustment \(staple finisher \(main\) adjustment\)](#) , [1.5.13.5 Rewind Paddle Descent Adjustment \(staple finisher \(main\) adjustment\)](#) in order.

• If the size of the paper to be adjusted exceeds 230mm, the FD alignment plate moves to the standby position because the paper is too long. Be careful that the paper jam possibly occurs at the paper exit section if the stacker is pulled out in this condition.

8. When the value is not within the standard value, press [Close].
9. "Rewind Paddle Descent Adjustment screen"
Enter the setting data through the numeric buttons and press [Set].
Setting range: -10 (Weak) to +10 (Strong)
1 step = 0.2mm
10. Repeat steps 5 to 9 until the standard value can be obtained.

5.13.6 SD-510 Fold&Staple Pitch Adjustment (staple finisher (fold) adjustment)

(1) Functions

Adjust the staple pitch for the Fold & Staple by the SD.

The Staple Pitch can be adjusted by adjusting the stop position of the stapler movement motor (M103) in this setting.

(2) Usage

Conduct this adjustment when the staple pitches of the Fold & Staple by SD are not within the standard value.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [02 Stapler(Fold) Adjustment].
3. "Stapler(Fold) Adjustment Menu screen"
Press [01 Fold&Staple Pitch Adjustment].
4. "Fold&Staple Pitch Adjustment screen"
Press [▼] or [▲] to select the paper size that you want to adjust.
5. Press [Print Mode].
6. Set paper in size that you want to adjust on the Tray and press the Start key to output the test pattern (No.16).
7. Confirm the interval "a" between the Staples against the Paper Size "b."
Standard value: $a = b/2 \pm 3\text{mm}$

8. When the value is not within the standard value, press [Close].
9. "Fold&Staple Pitch Adjustment screen"
Enter the setting data through the numeric buttons and press [Set].
Range: -300 (narrower) to +300 (wider)
1 step = 0.1mm
10. Repeat steps 5 to 9 until the standard value can be obtained.

5.13.7 SD-510 Fold&Staple Paper Width Adjustment (staple finisher (fold) adjustment)**(1) Functions**

Changes the CD Alignment Plate width of the staple bundle.

The paper width and the alignment width can be set by changing the driving amount of the saddle stitching alignment motor (M104) in this adjustment.

(2) Usage

Conduct this adjustment when there is a misalignment in the main scan direction in a bundle of paper while in stapling by SD.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [02 Stapler(Fold) Adjustment].
3. "Stapler(Fold) Adjustment Menu screen"
Press [02 Fold&Staple Paper Width Adj.].
4. "Stapler(Fold) Adjustment Menu screen"
Press [▼] or [▲] to select the paper size that you want to adjust.
5. Press [Print Mode].
6. Set paper in size that you want to adjust on the tray and press the Start key to output the test pattern (No.16).
7. Check to see if the bundle of papers is misaligned (a: a misalignment occurs when the paper width setting is larger than the paper width) and if the bundle is curved (b: the curve occurs when the paper width setting is smaller than the paper width).
Standard value "a": 1.0mm or less

8. When there is a misalignment or paper curvature, press [Close].
9. Enter the setting data through the numeric buttons and press [Set].
Range: -50 (narrower) to +50 (wider)
1 step = 0.1mm
10. Repeat steps 5 to 9 until the standard value can be obtained.

5.13.8 SD-510 Fold&Staple Staple Position Adjustment (staple finisher (fold) adjustment)

(1) Functions

Adjust the staple position for the Fold & Staple by the SD.

The staple position in the FD direction can be adjusted by adjusting the stop position of the stopper motor (M105) in this setting.

(2) Usage

Conduct this adjustment when the staple position of the Fold & Staple by SD is not within the standard value.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [02 Stapler(Fold) Adjustment].
3. "Stapler(Fold) Adjustment Menu screen"
Press [03 Fold&Staple Staple Pos. Adj.].
4. "Fold&Staple Staple Position Adjustment screen"
Press [▼] or [▲] to select the paper size that you want to adjust.
5. Press [Print Mode].
6. Set paper in size that you want to adjust on the tray and press the Start key to output the test pattern (No.16).
7. Check the misalignment "a" between the staple position and the fold position of the printed paper.
Standard value "a": $\pm 1\text{mm}$

8. When the value is not within the standard value, press [Close].
9. "Fold&Staple Staple Position Adjustment screen"
Enter the setting data through the numeric buttons and press [Set].
Range: -50 (paper exit upper side is longer) to +50 (paper exit upper side is shorter)
1 step = 0.1mm

10. Repeat steps 5 to 9 until the standard value can be obtained.

5.13.9 SD-510 Fold&Staple Fold Position Adjustment (staple finisher (fold) adjustment)

(1) Functions

Adjust the fold position on the Fold & Staple mode by the SD.

The folding position can be adjusted by adjusting the stop position of the stopper motor (M105) in this setting.

(2) Usage

Conduct this adjustment when the fold position of the Fold & Staple by SD is not within the standard value.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [02 Stapler(Fold) Adjustment].
3. "Stapler(Fold) Adjustment Menu screen"
Press [04 Fold&Staple Fold Pos. Adj.].
4. "Stapler(Fold) Adjustment Menu screen"
Press [▼] or [▲] to select the paper size that you want to adjust.
5. Press [Print Mode].
6. Set paper in size that you want to adjust on the Tray and press the Start key to output the test pattern (No.16).
7. Check the misalignment "a" on the edge of the printed paper.
Standard value "a": $\pm 1\text{mm}$

8. When the value is not within the standard value, press [Close].
9. "Fold&Staple Fold Position Adjustment screen"
Enter the setting data through the numeric buttons and press [Set].
Range: -50 (paper exit upper side is longer) to +50 (paper exit upper side is shorter)
1 step = 0.1mm

10. Repeat steps 5 to 9 until the standard value can be obtained.

5.13.10 SD-510 Half-Fold Fold Position Adjustment (staple finisher (fold) adjustment)

(1) Functions

Adjust the fold position on the Half-Fold Mode by the SD.
The folding position can be adjusted by adjusting the stop position of the stopper motor (M105) in this setting.

(2) Usage

Conduct this adjustment when the fold position of the Half-Fold by SD is not within the standard value.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [02 Stapler(Fold) Adjustment].
3. "Stapler(Fold) Adjustment Menu screen"
Press [05 Half-Fold Fold Position Adj.].
4. "Half-Fold Fold Position Adjustment screen"
Press [▼] or [▲] to select the paper size that you want to adjust.
5. Press [Print Mode].
6. Set paper in size that you want to adjust on the Tray and press the Start key to output the test pattern (No.16).
7. Check the misalignment "a" on the edge of the printed paper.
Standard value "a": = $\pm 2.0\text{mm}$

8. When the value is not within the standard value, press [Close].
9. "Half-Fold Fold Position Adjustment screen"
Enter the setting data through the numeric buttons and press [Set].
Range: -50 (paper exit upper side is longer) to +50 (paper exit upper side is shorter)
1 step = 0.1mm

10. Repeat steps 5 to 9 until the standard value can be obtained.

5.13.11 SD-510 Tri-Fold Position Adjustment (staple finisher (fold) adjustment)

(1) Functions

Adjust the fold positions on the multi tri-fold mode by the SD.
In the 1st Fold position adjustment, the folding position can be adjusted by changing the stop position of the stopper motor (M105).

In the 2nd Fold position adjustment, the folding position can be adjusted by changing the timing that the 2nd folding knife motor (M110) starts to rotate since the 2nd folding sensor (PS112) turns ON.

(2) Usage

Conduct this adjustment when the fold positions of multi tri-fold by SD is not within the standard value.

Note

- When adjusting both the 1st fold and the 2nd fold, be sure to start with the 1st fold.
- The position of the 1st fold is based on the leading edge of paper and the position of the 2nd fold is based on the position of the 1st fold. So, the dimension "b" in the step7 varies when either position of the 1st fold and the 2nd fold is changed.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [02 Stapler(Fold) Adjustment].
3. "Stapler(Fold) Adjustment Menu screen"
Press [06 Tri-Fold Adjustment].
4. "Tri-Fold Adjustment Menu screen"
Press [01 Tri-Fold Position Adjustment].
5. "Tri-Fold Position Adjustment screen"
Select the paper size that you want to adjust and press [Print Mode].
6. Set paper in size that you want to adjust on the Tray and press the Start key to output the test pattern (No.16).
7. Confirm "a" and "b" on the output paper.

Paper Size	Standard value (mm)	
	a ± 2.0	b ± 2.0
A4S	95.0	101.0
8 1/2 x 11S	89.4	95.0

[1] First fold	[2] Double fold
----------------	-----------------

8. When the value is not within the standard value, press [Close].
9. "Tri-Fold Position Adjustment screen"
Select the paper size that you want to adjust.
10. Press [1st Fold].
11. Enter the setting data through the numeric buttons and press [Set].
Range: -50 (shorter) to +50 (longer)
1 step = 0.1mm
 - The dimension "a" in the step7 gets larger when the set value is moved to the positive side and gets smaller when moved to the negative side.
12. Press [2nd Fold].
13. Enter the setting data through the numeric buttons and press [<<Set].
Range: -50 (shorter) to +50 (longer)
1 step = 0.1mm
 - The dimension "b" in the step7 gets larger when the setting data is moved to the positive side and gets smaller when moved to the negative side.
14. Repeat steps 5 to 13 until the standard value can be obtained.

5.13.12 SD-510 Double Fold Plate Adjustment (staple finisher (fold) adjustment)

(1) Functions

Adjust the pushing level of the 2nd folding knife on the multi tri-fold-in mode by the SD.

In this adjustment, the degree of how much the 2nd folding knife is pushed in is adjusted by changing the time of the forward rotation of the, 2nd knife motor (M110).

(2) Usage

Conduct the adjustment in case of the wide shift in the double folded bunch on the multi tri-fold-in mode by the SD.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [02 Stapler(Fold) Adjustment].
3. "Stapler(Fold) Adjustment Menu screen"
Press [06 Tri-Fold Adjustment].
4. "Tri-Fold Adjustment Menu screen"
Press [02 Double Fold Plate Adjustment].

5. "Double Fold Plate Adjustment screen"
Select the paper size that you want to adjust and press [Print Mode].
6. Set paper in size that you want to adjust on the Tray and press the Start key to output the test pattern (No.16).
7. Check the wide shift in the double folded bunch on the edge of the output paper.
8. Press [Close] in case of wide shift.
9. "Double Fold Plate Adjustment screen"
Enter the setting data through the numeric buttons and press [Set].
Setting range: -50 (shallower) to +50 (deeper)
1 step = 0.1mm
Note
 - **Push deeper in case of the wide shift.**
 - **Push shallower when the box folding occurs in the thin paper.**
 - **Push deeper when the overlap on the solid image shifts the 2nd folding positions of the cover, the 2nd paper and the succeeding sheets of paper.**
10. Repeat the steps 5 to 9 until the shift in the bunch is resolved.

5.13.13 SD-510 Half-Fold Strength Adjustment (staple finisher (fold) adjustment)

(1) Functions

Adjust the folding roller pressing time on the Fold & Staple Mode or the Multi Tri-Fold Mode by the SD.

The folding pressure can be adjusted by adjusting the low speed conveyance time of the folding roller motor (M108) in this setting. However, setting the pressing time longer decrease productivity.

(2) Usage

Lengthen the roller pressing time to strengthen the book fold.

Note

- **Productivity is reduced depending on the length of the roller pressing time.**

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [02 Stapler(Fold) Adjustment].
3. "Stapler(Fold) Adjustment Menu screen"
Press [07 Half-Fold Strength Adjustment].
4. "Half-Fold Strength Adjustment screen"
Press [Print Mode].
5. Set Paper in page quantity of the book to be created and press the Start key to output the test pattern (No.16).
6. Check the fold of the printed book, and press [Close] when the fold is weak.
7. "Half-Fold Strength Adjustment screen"
Enter the setting data through the numeric buttons and press [Set].
Range: 0 to +10 (add time)
1 step = 1 second
8. Repeat the steps 4 to 7 until an appropriate Fold strength is obtained.

5.13.14 PK-522 Vertical position adjustment (Crosswise Dir.) (staple finisher (punch) adjustment)

(1) Function

Adjust the punch position of the punch kit (PK) in the main scan direction.

The shift amount of the punch unit can be adjusted by changing the driving amount of the punch shift motor (M302) in this adjustment.

(2) Usage

Conduct this adjustment when the punch position of the punch kit (PK) in the main scan direction is not within the standard value.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [03 Stapler(Punch) Adjustment].
3. "Stapler(Punch) Adjustment Menu screen"
Press [01 Vert. Position Adj.(CD)].
4. "Punch Vert. Position Adj.(CD) screen"
Press [▼] or [▲] to select the paper size that you want to adjust.
5. Press [Print Mode].
6. Set paper in size that you want to adjust on the tray and press the Start key to output the test pattern (No.16).
7. Fold the output paper in half in the main scan direction, and measure the gap "a" between the center line of the print and the center of the punch hole.
Standard value "a": = ± 1mm

15knf3c002nb

[1] Center of the paper	[2] Center of the punch hole
-------------------------	------------------------------

8. "Punch Vert. Position Adj.(CD) screen"
Enter the setting data through the numeric buttons and press [Set].
Range: -50 (to front) to +50 (to back)
1 step = 0.1mm
9. Repeat steps 5 to 8 until the standard value can be obtained.

5.13.15 PK-522 Horizontal position adjustment (paper feed direction) (staple finisher (punch) adjustment)

(1) Function

Adjust the punch position of the punch kit (PK) in the sub scan direction.
The punch position in the sub scan direction can be adjusted by adjusting the stop timing of the conveyance motor in this adjustment.

(2) Usage

Conduct this adjustment when the punch position of the punch kit (PK) in the sub scan direction is not within the standard value.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [03 Stapler(Punch) Adjustment].
3. "Stapler(Punch) Adjustment Menu screen"
Press [02 Horiz. Position Adj.(FD)].
4. "Punch Horiz. Position Adj.(FD) screen"
Press [▼] or [▲] to select the paper size that you want to adjust.
5. Press [Print Mode].
6. Set paper in size that you want to adjust on the tray and press the Start key to output the test pattern (No.16).
7. Check the punch position "a" of the output paper in the sub scan direction.
Standard value "a":
- Inch area: 9.5mm ± 3.0mm
- Metric area: 11.0mm ± 3.0mm

15knf3c001nb

8. "Punch Horiz. Position Adj.(FD) screen"
Enter the setting data through the numeric buttons and press [Set].
Range: -50 (shorter) to +50 (longer)
1 step = 0.1mm
9. Repeat steps 5 to 8 until the standard value can be obtained.

5.13.16 PK-522 Registration Adjustment (staple finisher (punch) adjustment)

(1) Function

Change the registration loop amount of punch to adjust the paper skew.
In this adjustment, the loop can be adjusted by changing the driving time of the FNS entrance motor (M1) when paper strikes the entrance roller and a loop is formed.

(2) Usage

Conduct this adjustment when the punch hole of the punch kit (PK) is not straight.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [03 Stapler(Punch) Adjustment].
3. "Staple Finisher(Punch) Adjustment Menu screen"
Press [03 Registration Adjustment].
4. "Punch Registration Adjustment screen"
Select the item that you want to adjust and press [Print Mode].
5. Set paper in the tray or PI, and press Start to print the test pattern (No.16).
6. When the trouble is not solved, press [Close].
7. "Punch Registration Adjustment screen"
Enter the setting data through the numeric buttons and press [Set].
Range: -50 (smaller) to +50 (larger)
1 step = 0.1mm
8. Repeat the steps 4 to 7 until an appropriate value is obtained.

5.13.17 PK-522 Paper Edge Sensor Adjustment (staple finisher (punch) adjustment)**(1) Functions**

Adjust the sensitivity of the paper size sensor automatically to detect the paper edge as the standard of the punch hole properly.

(2) Usage

Adjust the sensitivity of the sensor after replacing the punch drive board (PDB) or the paper size sensor (PS305).

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [03 Stapler(Punch) Adjustment].
3. "Staple Finisher(Punch) Adjustment Menu screen"
Press [04 Paper Edge Sensor Adj.].
4. "Paper Edge Sensor Adjustment screen"
Press [Start].
5. A message "No Error" is displayed when the adjustment is finished successfully.

5.13.18 PI-502 Tray Size Adjustment (staple finisher (PI) adjustment)**(1) Function**

Adjust the detection size of the PI tray.

(2) Usage

Conduct this adjustment when the paper size is not correctly detected at the cover sheet tray of the PI.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [04 Stapler(PI) Adjustment]
3. "Stapler(PI) Adjustment Menu screen"
Press [01 Tray Size Adjustment].
4. "PI Tray Size Adjustment screen"
Select [Upper Tray] or [Lower Tray], press [A4] or [8¹/₂ x 11].
5. Load A4 paper in the selected tray of PI and press [Start]. (When you selected [8¹/₂ x 11] in step 4, load 8¹/₂ x 11 paper in the tray.)
6. A message "Completed" is displayed.
7. To adjust another tray, repeat the steps 4 to 6.
8. Exit the Service Mode, and check if original size set in the PI is correctly detected.

5.13.19 PI-502 PI Registration Adjustment (staple finisher (PI) adjustment)**(1) Function**

Adjust the punch registration loop at both the upper and lower stages of the post inserter.

(2) Usage

When a punch skew and crease occur, conduct this adjustment.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [04 Stapler(PI) Adjustment]
3. "Stapler(PI) Adjustment Menu screen"
Press [02 PI Registration Adjustment].

4. "PI Registration Adjustment screen"
Select either [PI Upper Tray] or [PI Lower Tray].
5. Set the paper which should be adjusted to the size of the selected PI tray, and feed the paper in the manual mode.
6. Check the outputted paper
7. Enter the setting data through the numeric buttons and press [<<Set].
Setting range: -5 (smaller) to +5 (larger)
1 step = 1.0mm

Note

- When there is a too much pucn skew, adjust the value to the positive side.
- When there is a too much paper crease, adjust the value to the negative side.

8. Repeat the steps 5 to 7 until an appropriate value is obtained.

5.13.20 FD-503 Paper Width Adjustment (Multi Folder(Punch) Adj.)**(1) Functions**

Adjusts the position of the alignment plate while in alignment.

(2) Usage

Adjust the misalignment of punch holes for punching by FD.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [05 Multi Folder(Punch) Adj.].
3. "Multi Folder(Punch) Adj. menu screen"
Press [01 Paper Width Adjustment].
4. "Paper Width Adjustment screen"
Press [Print Mode].

Note

- Large size: Sub scan direction of paper is more than 298mm
- Small size: Sub scan direction of paper is less than 297mm

5. Set paper you want to adjust in the tray, the number of copies is set to 10 and press the Start key.
6. Check the diameter of the through-hole when the ejected paper is stacked.

Holes	Standard value (mm)
2-Holes	φ5.0 or larger
3-Holes	φ6.5 or larger

7. When the value is not within the standard value, press [Close].
8. "Paper Width Adjustment screen"
Press [▼] or [▲] to select the paper size that you want to adjust.
9. Enter a value through the numeric buttons and press [<<SET].
Setting range: -20 (narrower) to +20 (wider)
1 step = 0.1mm

Note

- When the alignment plate is wider than an appropriate position, the punch centering is displaced, and when too narrow, the punch holes are apt to disperse.

10. Repeat the steps 4 to 9 until an appropriate value is obtained.

5.13.21 FD-503 Punch Vertical Position Adj. (Multi Folder(Punch) Adj.)**(1) Functions**

Adjusts the position of the alignment plate while in alignment.

(2) Usage

Adjust the position of the punch holes made by the FD in sub scanning direction.
2-hole or 3-hole is selectable.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [05 Multi Folder(Punch) Adj.].
3. "Multi Folder(Punch) Adj. menu screen"
Press [02 Punch Vertical Position Adj.].
4. "Punch Vertical Position Adj. screen"
Select [2-Hole] or [3-Hole].
5. "Punch Vertical Position Adj. screen"
Press [Print Mode].
6. Set paper in size to be adjusted on the tray and press the Start key to output the test pattern (No.16).
7. Check the distance "a" from the output paper leading edge to the punch holes center position.

Holes	Standard value "a" (mm)
2-Holes	10.5±4.0
3-Holes	9.5±4

fs503fs3013c

8. When the value is not within the standard value, press [Close].
9. "Punch Vertical Position Adj. screen"
Press [▼] or [▲] to select the paper size to be adjusted.
10. Enter a value through the numeric buttons and press [<<SET].
Setting range: -40 (wider) to +40 (narrower)
1 step = 0.1mm
11. Repeat steps 5 to 10 until the standard value can be obtained.
12. To configure other punch hole/paper size, repeat steps 4 to 11.

5.13.22 FD-503 Punch Gap Recovery adjustment (Multi Folder(Punch) Adj.)

(1) Functions

Adjust the gap recovery amount of the overlapped paper if the punch holes are misaligned.

(2) Usage

- Adjust it when the punch holes are misarranged in the sub scan direction for each paper during punching by FD.
- Fine adjust the gap recovery amount.
- Reduce the recovery amount when the roller scratching caused by recovering too much or the edge damage occurs.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [05 Multi Folder(Punch) Adj.].
3. "Multi Folder(Punch) Adj. menu screen"
Press [03 Punch Gap Recovery Adj.].
4. "Punch Gap Recovery Adjustment screen"
Press [Print Mode].
5. Set 2 sheets of paper with a weight to be adjusted. Check that the set number is "2" and press the Start key.
6. Check the diameter of the through-hole when the ejected paper is stacked.

Holes	Standard value "a" (mm)
2-Holes	φ5.0 or larger
3-Holes	φ6.5 or larger

7. When the value is not within the standard value, press [Close].
8. "Punch Gap Recovery adjustment screen"
Select the paper weight to be adjusted.
9. Enter a value through the numeric buttons and press [<<SET].
Setting range: -20 (wider) to +20 (narrower)
1 step = 0.1mm

Note

- Adjust the paper which output in lower side against the paper path of the 1st sheet.

10. Repeat steps 4 to 9 until the standard value can be obtained.

5.13.23 FD-503 Half Fold Position Adjustment (Multi Folder (Fold) Adj.)

(1) Functions

Adjust the paper stop position when folding papers.

(2) Usage

Adjust the fold position on the half fold mode by the FD.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [06 Multi Folder(Fold) Adj.].
3. "Multi Folder (Fold) adj. menu screen"
Press [01 Half-Fold Position Adj.].
4. "Folding Position Adjustment screen"
Press [Print Mode].
5. Set paper in size to be adjusted on the tray and press the Start key to output the test pattern (No.16).
6. Check the misalignment "a" on the edge of the outputted paper.
Standard value "a": = $\pm 1.5\text{mm}$

7. When the value is not within the standard value, press [Close].
8. "Folding Position Adjustment screen"
Press [▼] or [▲] to select the paper size to be adjusted.
9. Enter a value through the numeric buttons and press [<<SET].
Setting range: -50 to +50
1 step = 0.1mm
 - If there is the misalignment given in the step 6, enter a set value on the positive side.
10. Repeat steps 4 to 9 until the standard value can be obtained.

5.13.24 FD-503 Tri-Fold-in Pos. Adj. (Multi Folder (Fold) Adj.)**(1) Functions**

Adjust the paper stop position when folding papers.

(2) Usage

Adjust the fold positions on the tri-fold-in mode by the FD.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [06 Multi Folder(Fold) Adj.].
3. "Multi Folder (Fold) adj. menu screen"
Press [02 Tri-Fold-in Pos. Adj.].
4. "Tri-Fold-in Pos. Adj. screen"
Press [Print Mode].
5. Set paper in size to be adjusted on the tray and press the Start key to output test pattern (No.16).
6. Check "a" and "b" on the outputted paper.

Paper size	Standard value (mm)	
	a ± 1.5	b ± 1.5
A3	139.0	142.0
B4	120.3	123.3
A4S	98.0	101.0
SRA4S	105.7	108.7
12 x 18	151.4	154.4
11 x 17	142.9	145.9
8 ¹ / ₂ x 14	117.5	120.5
8 ¹ / ₂ x 11S	92.1	95.1
8K	129.0	132.0

[1] First fold	[2] Double fold
----------------	-----------------

7. When the value is not within the standard value, press [Close].
8. "Tri-Fold-in Pos. Adj. screen"
Press [▼] or [▲] to select the paper size to be adjusted.

9. Press [Single Fold].
10. Enter a value through the numeric buttons and press [<<SET].
Setting range: -50 (shorter) to +50 (longer)
1 step = 0.1mm
 - The dimension "a" in the step 6 gets larger when the set value is moved to the positive side and gets smaller when moved to the negative side.
11. Press [Double Fold].
12. Enter a value through the numeric buttons and press [<<SET].
Setting range: -50 (shorter) to +50 (longer)
1 step = 0.1mm
 - The dimension "b" in the step 6 gets larger when the set value is moved to the positive side and gets smaller when moved to the negative side.
13. Repeat steps 4 to 12 until the standard value can be obtained.

5.13.25 FD-503 Tri-Fold-out Pos. Adj. (Multi Folder (Fold) Adj.)

(1) Functions

Adjust the paper stop position when folding papers.

(2) Usage

Adjust the fold positions on the tri-fold-out mode by the FD.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [06 Multi Folder(Fold) Adj.].
3. "Multi Folder (Fold) adj. menu screen"
Press [03 Tri-Fold-out Pos. Adj.].
4. "Tri-Fold-out Pos. Adj. screen"
Press [Print Mode].
5. Set paper in size to be adjusted on the tray and press the Start key to output test pattern (No.16).
6. Check "a" and "b" on the outputted paper.

Paper size	Standard value (mm)	
	a ± 1.5	b ± 1.5
A3	282.0	144.0
B4	243.7	123.3
A4S	199.0	101.0
SR44S	214.3	108.7
12 x 18	306.8	156.4
11 x 17	289.9	147.9
8 1/2 x 14	238.1	120.5
8 1/2 x 11S	187.3	95.1
8K	262.0	134.0

[1] First fold	[2] Double fold
----------------	-----------------

7. When the value is not within the standard value, press [Close].
8. "Tri-Fold-out Pos. Adj. screen"
Press [▼] or [▲] to select the paper size to be adjusted.
9. Press [Single Fold].
10. Enter a value through the numeric buttons and press [<<SET].
Setting range: -50 (shorter) to +50 (longer)
1 step = 0.1mm
 - The dimension "a" in the step 6 gets larger when the set value is moved to the positive side and gets smaller when moved to the negative side.
11. Press [Double Fold].
12. Enter a value through the numeric buttons and press [<<SET].
Setting range: -50 (shorter) to +50 (longer)
1 step = 0.1mm
 - The dimension "b" in the step 6 gets larger when the set value is moved to the positive side and gets smaller when moved to the negative side.
13. Repeat steps 4 to 12 until the standard value can be obtained.
14. To configure other paper size, repeat steps 4 to 13.

5.13.26 FD-503 Double Parallel Pos. Adj. (Multi Folder (Fold) Adj.)**(1) Functions**

Adjust the paper stop position when folding papers.

(2) Usage

Adjust the fold positions on the double parallel mode by the FD.

Note

- When adjusting both the single fold and the double fold, be sure to start with the single fold.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [06 Multi Folder(Fold) Adj.].
3. "Multi Folder (Fold) adj. menu screen"
Press [04 Double Parallel Pos. Adj.].
4. "Double Parallel Pos. Adj. screen"
Press [Print Mode].
5. Set paper in size to be adjusted on the tray and press the Start key to output test pattern (No.16).
6. Check "a" and "b" on the outputted paper.

Paper size	Standard value (mm)	
	a ± 1.5	b ± 1.5
A3	208.5	103.8
B4	180.5	89.8
A4S	147.0	73.0
SRA4S	158.5	78.8
12 x 18	227.1	113.1
11 x 17	214.4	106.7
8 1/2 x 14	176.3	87.7
8 1/2 x 11S	138.2	68.6
8K	193.5	96.3

[1] First fold	[2] Double fold
----------------	-----------------

7. When the value is not within the standard value, press [Close].
8. "Double Parallel Pos. Adj. screen"
Press [▼] or [▲] to select the paper size to be adjusted.
9. Press [Single Fold].
10. Enter a value through the numeric buttons and press [<<SET].
Setting range: -50 (shorter) to +50 (longer)
1 step = 0.1mm
 - The dimension "a" in the step 6 gets larger when the set value is moved to the positive side and gets smaller when moved to the negative side.
11. Press [Double Fold].
12. Enter a value through the numeric buttons and press [<<SET].
Setting range: -50 (shorter) to +50 (longer)
1 step = 0.1mm
 - The dimension "b" in the step 6 gets larger when the set value is moved to the positive side and gets smaller when moved to the negative side.
13. Repeat steps 4 to 12 until the standard value can be obtained.

5.13.27 FD-503 Z-Fold Position Adj. (Multi Folder (Fold) Adj.)**(1) Functions**

Adjust the paper stop position when folding papers.

(2) Usage

Adjust the fold positions on the z-fold mode by the FD.

Note

- When adjusting both the single fold and the double fold, be sure to start with the single fold.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [06 Multi Folder(Fold) Adj.].
3. "Multi Folder (Fold) adj. menu screen"
Press [05 Z-Fold Position Adj.].
4. "Z-Fold Position Adjustment screen"
Press [Print Mode].
5. Set paper in size to be adjusted on the tray and press the Start key to output test pattern (No.16).
6. Check "a" and "b" on the outputted paper.

Paper size	Standard value (mm)	
	a ± 1.5	b ± 1.5
A3	105.5	108.5
B4	91.5	94.5
A4S	74.8	77.8
SRA4S	80.5	83.5
12 x 18	114.8	117.8
11 x 17	108.5	111.5
8 1/2 x 14	94.0	-
8 1/2 x 11S	70.4	73.4
8K	98.0	101.0

[1]	First fold	[2]	Double fold
-----	------------	-----	-------------

7. When the value is not within the standard value, press [Close].
8. "Z-Fold Position Adjustment screen"
Press [▼] or [▲] to select the paper size to be adjusted.
9. Press [Single Fold].
10. Enter a value through the numeric buttons and press [<<SET].
Setting range: -50 (shorter) to +50 (longer)
1 step = 0.1mm
 - The dimension "a" in the step 6 gets larger when the set value is moved to the positive side and gets smaller when moved to the negative side.
11. Press [Double Fold].
12. Enter a value through the numeric buttons and press [<<SET].
Setting range: -50 (shorter) to +50 (longer)
1 step = 0.1mm
 - The dimension "b" in the step 6 gets larger when the set value is moved to the positive side and gets smaller when moved to the negative side.
13. Repeat steps 4 to 12 until the standard value can be obtained.

5.13.28 FD-503 Gate Position Adj. (Multi Folder (Fold) Adj.)**(1) Functions**

Adjust the paper stop position when folding papers.

(2) Usage

Adjusts the fold position on the gate fold mode by the FD.

Note

- When adjusting the single fold, the double fold and the triple fold, be sure to conduct the single fold, the double fold and the triple fold in this order.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [06 Multi Folder(Fold) Adj.].
3. "Multi Folder (Fold) adj. menu screen"
Press [06 Gate Position Adj.].

4. "Gate Position Adjustment screen"
Press [Print Mode].
5. Set paper in size to be adjusted on the tray and press the Start key to output test pattern (No.16).
6. Check the length of 2 places indicated with "a", "b" and "c".

Paper size	Standard value (mm)		
	a ± 1.5	b ± 1.5	c ± 1.5
A3	103.5	213.0	106.5
B4	89.5	185.0	92.5
A4S	72.8	151.5	75.8
SRA4S	78.5	163.0	81.5
12 x 18	112.8	231.6	115.8
11 x 17	106.5	218.9	109.5
8 ¹ / ₂ x 14	87.4	180.8	90.4
8 ¹ / ₂ x 11S	68.4	142.7	71.4
8K	96.0	198.0	99.0

[1] First fold	[3] Triple Fold
[2] Double fold	

7. When the value is not within the standard value, press [Close].
8. "Gate Position Adjustment screen"
Press [▼] or [▲] to select the paper size to be adjusted.
9. Press [Single Fold].
10. Enter a value through the numeric buttons and press [<<SET].
Setting range: -50 (shorter) to +50 (longer)
1 step = 0.1mm
 - The dimension "a" in the step 6 gets larger when the set value is moved to the positive side and gets smaller when moved to the negative side.
11. Press [Double Fold].
12. Enter a value through the numeric buttons and press [<<SET].
Setting range: -50 (shorter) to +50 (longer)
1 step = 0.1mm
 - The dimension "b" in the step 6 gets larger when the set value is moved to the positive side and gets smaller when moved to the negative side.
13. Press [Triple Fold].
14. Enter a value through the numeric buttons and press [<<SET].
Setting range: -50 (shorter) to +50 (longer)
1 step = 0.1mm
 - The dimension "c" in the step 6 gets larger when the set value is moved to the positive side and gets smaller when moved to the negative side.
15. Repeat steps 4 to 14 until the standard value can be obtained.

5.13.29 FD-503 Fold Registration Loop Adjustment (Multi Folder (Fold) Adj.)

(1) Functions

Adjust the fold registration loop amount.

(2) Usage

Adjust paper loop amount at the FD registration roller to correct paper skew, wrinkle, or paper jam at the roller.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [06 Multi Folder(Fold) Adj.].
3. "Multi Folder(Punch) Adj. menu screen"
Press [07 Fold Registration Loop Adj.].
4. "Fold Registration Loop Adjustment screen"
Press [Print Mode].
5. Set the A3 or 11 x 17 paper. Press the Start key to output the test pattern (No.16).
6. When the trouble is not solved, press [Close].
7. "Fold Registration Loop Adjustment screen"
Enter a value through the numeric buttons and press [<<SET].

Setting range: -50 (smaller) to +50 (larger)

1 step = 0.1mm

8. Repeat the steps 4 to 7 until an appropriate value is obtained.

5.13.30 LS-505 Paper Width Adjustment (Stacker Adjustment)

(1) Functions

Adjusts the position of the alignment plate while in alignment.

(2) Usage

Conduct this adjustment when a paper exit mis-alignment occurs in the main scan direction of the LS stacker tray.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [07 Stacker Adjustment].
3. "Stacker Adjustment Mode Menu screen"
Press [01 Paper Width Adjustment].
4. "Paper Width Adjustment screen"
Select [Stacker No.1], [Stacker No.2] or [Stacker No.3].
5. "Paper Width Adjustment screen"
Press [Print Mode].
6. Set the A3 or 11 x 17 paper and press the Start key to output the test pattern (No.16).
7. If the problem is not solved, press [Close].
8. Enter a value through the numeric buttons and press [<<SET].
Setting range: -20 (narrower) to +20 (wider)
1 step = 0.1mm
9. Repeat the steps 5 to 8 until an appropriate value is obtained.

5.13.31 LS-505 Paper Length Adjustment (Stacker Adjustment)

(1) Functions

Adjust the lead edge stopper position.

(2) Usage

Conduct this adjustment when a paper exit mis-alignment occurs in the sub scan direction of the LS stacker tray.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [07 Stacker Adjustment].
3. "Stacker Adjustment Mode Menu screen"
Press [02 Paper Length Adjustment].
4. "Paper Length Adjustment screen"
Select [Stacker No.1], [Stacker No.2] or [Stacker No.3].
5. "Paper Length Adjustment screen"
Press [Print Mode].
6. Set the A3 or 11 x 17 paper and press the Start key to output the test pattern (No.16).
7. If the problem is not solved, press [Close].
8. Enter a value through the numeric buttons and press [<<SET].
Setting range: -20 (narrower) to +20 (wider)
1 step = 0.1mm
9. Repeat the steps 4 to 7 until an appropriate value is obtained.

5.13.32 SD-506 Staple Center Position (Saddle Stitcher Pos. Adj.)

(1) Functions

Adjust the position of the alignment plate while in alignment.

(2) Usage

Adjust the staple center position for the saddle stitch mode by the SD.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [08 Saddle Stitcher Adjustment].
3. "Saddle Stitcher Adjustment menu screen"
Press [01 Staple Center Position].
4. "Stapling Center Position Adjustment screen"
Press [Print Mode].
5. Set the A3 or 11 x 17 paper and press the Start key to output the test pattern (No.16).

6. Check the misalignment "a" between the staple center and the paper center.
Standard value "a": $\pm 2\text{mm}$

7. When the value is not within the standard value, press [Close].
8. "Stapling Center Position Adjustment screen"
Enter a value through the numeric buttons and press [<<SET].
Setting range: -20 (right) to +20 (left)
1 step = 0.1mm
9. Repeat steps 4 to 8 until the standard value can be obtained.

5.13.33 SD-506 Staple Paper Width Adj. (Saddle Stitcher Pos. Adj.)

(1) Functions

Adjust the position of the saddle stitching alignment plate while in alignment.

(2) Usage

Adjust an uneven binding in a bundle of paper in saddle stitch mode by the SD.

Note

- Make sure that the folding skew adjustment of the mechanical adjustment has been completed.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [08 Saddle Stitcher Adjustment].
3. "Saddle Stitcher Adjustment Menu screen"
Press [02 Staple Paper Width Adj.].
4. "Staple Paper Width Adjustment screen"
Press [Print Mode].
5. Set paper in size to be adjusted on the tray and press the Start key to output test pattern (No.16).
6. Check to see if the bundle of papers is misaligned (a: a misalignment occurs when the paper width setting is larger than the paper width) and if the bundle is curved (b: the curve occurs when the paper width setting is smaller than the paper width).
Standard value "a": 1.0mm or less

7. When the value is not within the standard value, press [Close].
8. "Staple Paper Width Adjustment screen"
Press [▼] or [▲] to select the paper size to be adjusted.
9. Enter a value through the numeric buttons and press [<<SET].
Setting range: -20 (narrower) to +20 (wider)
1 step = 0.1mm
10. Repeat steps 4 to 9 until the standard value can be obtained.

5.13.34 SD-506 Staple Pitch Adjustment (Saddle Stitcher Pos. Adj.)

(1) Functions

Adjust the staple intervals for the saddle stitch mode by the SD.

(2) Usage

Conduct this adjustment when the staple intervals of the saddle stitching by SD are not within the standard value.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"

- Press [08 Saddle Stitcher Adjustment].
- "Saddle Stitcher Adjustment menu screen"
Press [03 Staple Pitch Adjustment].
 - "Staple Pitch Adjustment screen"
Press [Print Mode].
 - Set paper in size to be adjusted on the tray and press the Start key to output test pattern (No.16).
 - Check the interval "a" between the staples against the paper size "b."
Standard value: $b/2 \pm 2\text{mm}$

- When the value is not within the standard value, press [Close].
- "Staple Pitch Adjustment screen"
Press [▼] or [▲] to select the paper size to be adjusted.
- "Staple Pitch Adjustment screen"
Enter a value through the numeric buttons and press [<<SET].
Setting range: -20 (narrower) to +20 (wider)
1 step = 1.0mm
 - There are restrictions of setting range for each size of paper. Minimum value is determined based on the stapler movable range and the maximum value is determined so that the saddle stitching alignment plate and stapler do not interfere with each other. B5S: Setting is not possible (fixed to 91mm)
B4: -20 to +20 mm (108.5 to 148.5 mm)
A4S: -14 to +14 mm (91 to 119 mm)
A3: -20 to +16.5 mm (128.5 to 165 mm)
- Repeat steps 4 to 9 until the standard value can be obtained.

5.13.35 SD-506 Half-Fold Position Adj. (Saddle Stitcher Pos. Adj.)

(1) Functions

Adjust the fold position on the multi half fold mode by the SD.

(2) Usage

Conduct this adjustment when the folding position of half folding by SD is not within the standard value.

(3) Procedure

- "Service Mode Menu screen"
Press [11 Finisher Adjustment].
- "Service Mode Menu screen"
Press [08 Saddle Stitcher Adjustment].
- "Saddle Stitcher Adjustment menu screen"
Press [04 Half-Fold Position Adj.].
- "Folding Position Adjustment screen"
Press [Print Mode].
- Set paper in size to be adjusted on the tray and press the Start key to output test pattern (No.16).
- Check the misalignment "a" on the edge of the outputted paper.
Standard value "a": 1.5mm or less

- When the value is not within the standard value, press [Close].
- "Folding Position Adjustment screen"
Press [▼] or [▲] to select the paper size to be adjusted.
- "Folding Position Adjustment screen"
Enter a value through the numeric buttons and press [<<SET].
Setting range: -50 (shorter) to +50 (longer)
1 step = 0.1mm
 - If there is the misalignment given in the step 6, enter a set value on the positive side.
- Repeat steps 4 to 9 until the standard value can be obtained.

5.13.36 SD-506 Tri-Fold Position Adj. (Saddle Stitcher Pos. Adj.)

(1) Functions

Adjust the fold positions on the multi tri-fold-in mode by the SD.

(2) Usage

Conduct this adjustment when the folding position of multi tri-folding by SD is not within the standard value.

Note

- When adjusting both the single fold and the double fold, be sure to start with the single fold.
- The position of the single fold is based on the leading edge of paper and the position of the double fold is based on the position of the single fold. So, the dimension "b" in the step 7 varies when either position of the single fold and the double fold is changed.

(3) Procedure

- "Service Mode Menu screen"
Press [11 Finisher Adjustment].
- "Service Mode Menu screen"
Press [08 Saddle Stitcher Adjustment].
- "Saddle Stitcher Adjustment menu screen"
Press [05 Tri-Fold Position Adj.].
- "Tri-Fold Position Adjustment screen"
Press [Print Mode].
- Set paper in size that you want to adjust on the tray and press the Start key to output the test pattern (No.16).
- Check "a" and "b" on the outputted paper.

Paper size	Standard value (mm)	
	a	b
A4S	97.5 +/- 1.5	102.0 +/- 3.0
8 1/2 x 11S	91.6 +/- 1.5	96.1 +/- 3.0

[1] First fold	[2] Double fold
----------------	-----------------

- When the value is not within the standard value, press [Close].
- "Tri-Fold Position Adjustment screen"
Select the size of paper you want to adjust.
- Press [Single Fold].
- Enter a value through the numeric buttons and press [<<SET].
Setting range: -100 (shorter) to +100 (longer)
1 step = 0.1mm
 - The dimension "b" in the step 6 gets larger when the set value is moved to the positive side and gets smaller when moved to the negative side.
- Press [Double Fold].
- Enter a value through the numeric buttons and press [<<SET].
Setting range: -100 (longer) to +100 (shorter)
1 step = 0.1mm
 - The dimension "a" in the step 6 gets smaller when the set value is moved to the positive side and gets larger when moved to the negative side.
- Repeat steps 4 to 12 until the standard value can be obtained.

5.13.37 SD-506 Fold Paper Width Adj. (Saddle Stitcher Pos. Adj.)

(1) Functions

Adjust the alignment width while in alignment (sub scan direction).

(2) Usage

When there is an uneven edge found with the bundle paper at the folding or multi tri-folding mode by SD, conduct this adjustment.

(3) Procedure

- "Service Mode Menu screen"
Press [11 Finisher Adjustment].
- "Service Mode Menu screen"
Press [08 Saddle Stitcher Adjustment].
- "Saddle Stitcher Adjustment menu screen"
Press [06 Fold Paper Width Adj.].
- "Fold Paper Width Adjustment screen"
Press [Print Mode].
- Set the paper of the paper size to be adjusted. Press the Start key to output the test pattern (No.16).

6. Check the printed pages for misalignment.
 - a: When the paper width setting is set to wider than the actual paper width, misalignment occurs at random.
 - b: When the paper width setting is set to narrower than the actual paper width, misalignment occurs in 1 direction.

7. When the value is not within the standard value, press [Close].
8. "Fold Paper Width Adjustment screen"
Press [▼] or [▲] to select the paper size to be adjusted.
9. "Fold Paper Width Adjustment screen"
Enter a value through the numeric buttons and press [<<SET].
Setting range: -50 (narrower) to +50 (wider)
1 step = 0.1mm
10. Repeat steps 4 to 9 until the standard value can be obtained.

5.13.38 SD-506 Trimming Adjustment (Saddle Stitcher Pos. Adj.)

(1) Functions

Change the registration position of the book for trimming.

(2) Usage

Adjust the misalignment in the trimmed fore-edge or the excess trimming by the SD.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [08 Saddle Stitcher Adjustment].
3. "Saddle Stitcher Adjustment Menu screen"
Press [07 Trimming Adjustment].
4. "Trimming Adjustment screen"
Press [Print Mode].
5. Set paper in size that you want to adjust on the tray and press the Start key to output the test pattern (No.16).
6. Check the trimming distance "a" on the cover paper.
Standard value "a": 2mm or more

Note

- Trimming distance less than 2mm causes trimming fault.

7. When the value is not within the standard value, press [Close].
8. "Trimming Adjustment screen"
Press [▼] or [▲] to select the paper size that you want to adjust.
9. "Trimming Adjustment screen"
Enter a value through the numeric buttons and press [<<SET].
Setting range: -400 (smaller) to +400 (larger)
1 step = 0.1mm

Note

- Since the minimum dimension (from the spine to the fore edge) after the trimming is limited to 122mm, the set value up to +400 fails to be reflected depending on the size of the paper.

10. Repeat steps 4 to 9 until the standard value can be obtained.

5.13.39 SD-506 Trimmer Receiver Adj. (Saddle Stitcher Pos. Adj.)

(1) Functions

Adjust the shift interval and the move pitch of the trimmer board.

(2) Usage

Adjust the poor trimming (for example, fluff on the cut end) in the trimming by the SD.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [08 Saddle Stitcher Adjustment].
3. "Saddle Stitcher Adjustment Menu screen"
Press [08 Trimmer Receiver Adjustment].
4. "Trimmer Receiver Adjustment Menu screen"
Select the options for "01 Count Select for Move" (number of cuts counted until the trimmer board moves) and "02 Moving Pitch Select" (travel distance of the trimmer board when it moves).

5.13.40 PB-503 Cover Trimming Adj. (Perfect Binder Adjustment)**(1) Functions**

Adjusts the trimming position of the right-side edge of the cover paper.

(2) Usage

Conduct this adjustment when the trimming position on the leading edge of the right cover does not fit to the leading edge of the left cover.

Note

- In order to align the leading edges on the left and right covers, perform [I.5.13.41 PB-503 Cover Lead Edge Adj. \(Perfect Binder Adjustment\)](#) first and then perform the cover trimming adjustment.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [09 Perfect Binder Adjustment].
3. "Perfect Binder Adjustment Menu screen"
Press [01 Cover Trimming Adj.].
4. "Cover Trimming Adjustment screen"
Press [Perfect Binder Tray] or [Main Body Tray] to select the tray to be adjusted.
5. Press [Print Mode].
6. Select the paper type and press the start button to make test prints and carry out perfect binding.
7. Check the cover of the created book if its right-side edge and left-side edge align with each other.

[1]	Trimming position	[3]	Left cover paper
[2]	Right cover paper		

8. Press [Close] to change the trimming position of the right cover paper.
9. "Cover Trimming Adjustment screen"
Enter a value through the numeric buttons and press [<<SET].
Setting range: -128 (reduces the trimming amount) to +127 (enlarges the trimming amount)
1 step = 0.1mm
10. Repeat the steps 4 to 9 until an appropriate value is obtained.

5.13.41 PB-503 Cover Lead Edge Adj. (Perfect Binder Adjustment)**(1) Functions**

Sets the length that the left side of cover paper exceeds the length (width) of inside pages.

(2) Usage

Conduct this adjustment when the length that the left side of cover paper exceeds the length (width) of inside pages is not adequate.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [09 Perfect Binder Adjustment].
3. "Perfect Binder Adjustment Menu screen"
Press [02 Cover Lead Edge Adj.].
4. "Cover Lead Edge Adj. screen"
Press [Main Body Tray] or [Perfect Binder Tray] to select the tray that you want to adjust.
5. Press [▼] or [▲] to select the paper size of cover paper.
Select the size of paper from the following options.
Total
8¹/₂ x 11
A4

A5S
B5
A5
5¹/₂ x 8¹/₂
Infinite
16K
8¹/₂ x 11W
5¹/₂ x 8¹/₂ W
A4W
A5W
B5W

Note

- Above paper sizes are book (the inside pages) finished sizes.

- Press [Print Mode].
- Select the paper type and press the start button to make test prints and carry out perfect binding.
- Check that the width of the left cover paper is longer than the width of the inside pages by specified amount.

[1]	Body	[4]	Length differential
[2]	Right cover paper	[5]	Edge of the left cover paper
[3]	Left cover paper		

- To change the width of the left cover paper, press [Close].
- "Cover Lead Edge Adjustment screen"
Enter a value through the numeric buttons and press [<<SET].
Setting range: -128 (shorter) to +127 (longer)
1 step = 0.1mm
- Repeat the steps 4 to 10 until an appropriate value is obtained.

5.13.42 PB-503 Spine Corner form Pos. (Perfect Binder Adjustment)

(1) Functions

Adjusts the corner folding position of the cover paper.

(2) Usage

Adjust when the spine corner form position is not adequate.

(3) Procedure

- "Service Mode Menu screen"
Press [11 Finisher Adjustment].
- "Service Mode Menu screen"
Press [09 Perfect Binder Adjustment].
- "Perfect Binder Adjustment Menu screen"
Press [03 Spine Corner Forming Pos.].
- "Spine Corner Forming Position Adj. screen"
Press [Print Mode].
- Select the paper type and press the start button to make test prints and carry out perfect binding.
- Check that the corner edges of the cover paper are created uniformly in the main scan direction.

[1]	Right cover paper	[3]	Cover paper
[2]	In the direction of the main scan	[4]	Left cover paper

- When the corner edges of the cover paper are not created uniformly, press [Close].
- "Spine Corner Forming Position Adj. screen"
Select either of [Front Adj.] or [Rear Adj.].
Enter a value through the numeric buttons and press [<<SET].
Setting range: -128 (down) to +127 (up)

1 step = 0.1mm

9. Repeat the steps 4 to 8 until an appropriate value is obtained.

5.13.43 PB-503 Glue Start Position (Perfect Binder Adjustment)

(1) Functions

Adjusts the start position for applying glue to inside pages.

(2) Usage

Adjust when the start position for applying glue to inside pages is not adequate.

(3) Procedure

- "Service Mode Menu screen"
Press [11 Finisher Adjustment].
- "Service Mode Menu screen"
Press [09 Perfect Binder Adjustment].
- "Perfect Binder Adjustment Menu screen"
Press [04 Glue Start Position].
- "Pasting Start Pos. Adj. screen"
Press [Ahead] or [Back] to select which start position, for applying during forward movement or backward movement, that you want to adjust.
- Press [▼] or [▲] to select the paper size of cover paper.
Select the size of paper from the following options.
Total
8¹/₂ x 11
A4
B5
A5
5¹/₂ x 8¹/₂
16K
A4W
B5W
A5W
8¹/₂ x 11W
5¹/₂ x 8¹/₂W
Infinite
Note
 - Above paper sizes are book (the inside pages) finished sizes.
 - [Back] does not require the adjustment.
- Press [Print Mode].
- Select the paper type and press the start button to make test prints and carry out perfect binding.
- Check that the glue applying start position to the inside pages is appropriate.

[1]	Start position for frontward applying	[3]	Body
[2]	Start position for backward applying	[4]	

- To adjust the start position, press [Close].
- "Pasting Start Pos. Adj. screen"
Enter a value through the numeric buttons and press [<<SET].
Setting range: -128 (earlier) to +127 (later)
1 step = 0.1mm
- Repeat the steps 4 to 10 until an appropriate value is obtained.

5.13.44 PB-503 Glue Finish Position (Perfect Binder Adjustment)

(1) Functions

Adjusts the position to finish applying glue.

(2) Usage

Adjust when the completion position for applying glue to inside pages is not adequate.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [09 Perfect Binder Adjustment].
3. "Perfect Binder Adjustment Menu screen"
Press [05 Glue Finish Position].
4. "Paste Finish Pos. Adj. screen"
Press [Ahead] or [Back] to select which finish position, for applying during forward movement or backward movement, that you want to adjust.
5. Press [▼] or [▲] to select the paper size of cover paper.
Select the size of paper from the following options.
Total
8¹/₂ x 11
A4
B5
A5
5¹/₂ x 8¹/₂
16K
A4W
B5W
A5W
8¹/₂ x 11 W
5¹/₂ x 8¹/₂W
Infinite

Note

- Above paper sizes are book (the inside pages) finished sizes.

6. Press [Print Mode].
7. Select the paper type and press the start button to make test prints and carry out perfect binding.
8. Check that the glue applying start position to the inside pages is appropriate.

1050fs3361c

[1]	Finish position for backward applying	[3]	Body
[2]	Finish position for frontward applying	[4]	

9. To adjust the finish position, press [Close].
10. "Paste Finish Pos. Adj. screen"
Enter a value through the numeric buttons and press [<<SET].
Setting range: -128 (earlier) to +127 (later)
1 step = 0.1mm
11. Repeat the steps 4 to 10 until an appropriate value is obtained.

5.13.45 PB-503 Temperature Adjustment (Perfect Binder Adjustment)**(1) Functions**

Sets the temperatures to be detected by the glue apply roller temperature sensor (TH1), the glue tank temperature sensor/Up (TH2), the glue tank temperature sensor/Md (TH3), and the glue tank temperature sensor/Lw (TH4) provided in the glue tank.

(2) Usage

Adjust it when the applied glue does not harden or when the cover paper easily comes unglued.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [09 Perfect Binder Adjustment].
3. "Perfect Binder Adjustment Menu screen"
Press [06 Temperature Adjustment].
4. "Temperature Adjustment screen"
Press [Print Mode].
5. Select the paper type and press the start button to make test prints and carry out perfect binding.
6. Check that the glue applied has dried appropriately.
7. To adjust the dryness of the glue, press [Close].
8. "Temperature Adjustment screen"

Select the option of which the temperature is set.

The following options are provided.

- Glue Tank - Top
- Glue Tank - Mid
- Glue Tank - Low
- Glue Apply Roller

9. Enter a value through the numeric buttons and press [<<SET].

- Glue Tank - Top
Setting range: 128 °C to 136 °C
Default: 132 °C
- Glue Tank - Mid
Setting range: 140 °C to +145 °C
Default: 145 °C
- Glue Tank - Low
Setting range: 180 °C to +190 °C
Default: 185 °C
- Glue Apply Roller
Setting range: 160 °C to +170 °C
Default: 165 °C

10. Repeat the steps 4 to 9 until an appropriate value is obtained.

5.13.46 PB-503 Sub Compile CD Width Adj. (Perfect Binder Adjustment)

(1) Functions

Adjusts the alignment width of the inside pages when aligning in the main scan direction.

(2) Usage

Adjust when the alignment width of the inside pages in the main scan direction is not adequate.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [09 Perfect Binder Adjustment].
3. "Perfect Binder Adjustment Menu screen"
Press [07 Sub Compile CD Width Adj.].
4. "Sub Compile CD Width Adjustment screen"
Press [▼] or [▲] to select the paper size.
Select the size of paper from the following options.

Total

8¹/₂ x 11

A4

B5

A5

5¹/₂ x 8¹/₂

16K

A4W

B5W

8¹/₂ x 11 W

5¹/₂ x 8¹/₂ W

Infinite

Note

- Above paper sizes are book (the inside pages) finished sizes.

5. "Sub Compile CD Width Adjustment screen"
Enter a value through the numeric buttons and press [<<SET].
Setting range: -20 (wider) to +20 (narrower)
1 step = 0.1mm
6. Create multiple books in normal copy mode, and check the alignment of the second and later book.
Change set value set in Step5 until a properly aligned book is created.

5.13.47 PB-503 Clamp CD Width Adjustment (Perfect Binder Adjustment)

(1) Functions

Adjusts the alignment width of the inside pages when aligning in the main scan direction.

(2) Usage

Adjust when the alignment width of the inside pages in the main scan direction is not adequate.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"

Press [09 Perfect Binder Adjustment].

3. "Perfect Binder Adjustment Menu screen"

Press [08 Clamp CD Width Adj.].

4. "Clamp CD Width Adjustment screen"

Press [▼] or [▲] to select the paper size.

Select the size of paper from the following options.

Total

8¹/₂ x 11

A4

B5

A5

5¹/₂ x 8¹/₂

16K

A4W

B5W

A5W

8¹/₂ x 11 W

5¹/₂ x 8¹/₂ W

Infinite

Note

- Above paper sizes are book (the inside pages) finished sizes.

5. "Clamp CD Width Adjustment screen"

Enter a value through the numeric buttons and press [<<SET].

Setting range: -20 (wider) to +20 (narrower)

1 step = 0.1mm

6. Create multiple books in normal copy mode, and check the alignment of the second and later book.
Change set value set in Step5 until a properly aligned book is created.

5.13.48 PB-503 Cover Up/Down CD Width Adj. (Perfect Binder Adjustment)

(1) Functions

Adjusts the positional relation in the main scan direction between the cover paper and the inside pages.

(2) Usage

Adjust when the positional relation in the main scan direction between the cover paper and the inside pages is not adequate.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [09 Perfect Binder Adjustment].
3. "Perfect Binder Adjustment Menu screen"
Press [09 Cover Up/Down CD Width Adj.].
4. "Cover Up/Down CD Width Adjustment screen"
Press [Perfect Binder Tray] or [Main Body Tray] to select the tray to be adjusted.
5. Press [Print Mode].
6. Select the paper type and press the start button to make test prints and carry out perfect binding.
7. Check if the relation between the main scan position of the cover and that of the inside pages are appropriate.
8. To adjust the relation of their main-scanning positions, press [Close].
9. "Cover Up/Down CD Width Adjustment screen"
Enter a value through the numeric buttons and press [<<SET].
Setting range: -20 (wider) to +20 (narrower)
1 step = 0.1mm
10. Repeat the steps 4 to 9 until an appropriate value is obtained.

5.13.49 PB-503 Clamp FD Position Adj. (Perfect Binder Adjustment)

(1) Functions

Adjusts the alignment width of the inside pages when aligning in the sub scan direction.

(2) Usage

Adjust when the alignment width of the inside pages in the sub scan direction is not adequate.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [09 Perfect Binder Adjustment].
3. "Perfect Binder Adjustment Menu screen"
Press [10 Clamp FD Position Adj.].
4. "Clamp FD Position Adjustment screen"
Press [▼] or [▲] to select the paper size.
Select the size of paper from the following options.

Total
 $8\frac{1}{2} \times 11$
 A4
 B5
 A5
 $5\frac{1}{2} \times 8\frac{1}{2}$
 16K
 A4W
 B5W
 A5W
 $8\frac{1}{2} \times 11$ W
 $5\frac{1}{2} \times 8\frac{1}{2}$ W
 Infinite

Note

- Above paper sizes are book (the inside pages) finished sizes.

- Press [Print Mode].
- Select the paper type and press the start button to make test prints and carry out perfect binding.
- Check if the sub scan direction of all the inside pages are properly aligned.
- To adjust the alignment width in sub-scanning direction of the inside pages, press [Close].
- "Clamp FD Position Adjustment screen"
 Enter a value through the numeric buttons and press [<<SET].
 Setting range: -20 (wider) to +20 (narrower)
 1 step = 0.1mm
- Repeat the steps 4 to 9 until an appropriate value is obtained.

Note

- If the setting is too wide, pages are misplaced in sub scan direction.
- If the setting is too narrow, mark of the FD alignment plate appears.

5.13.50 RU-510 Paper Width Adjustment (Relay Stacker Adjustment)**(1) Functions**

Adjust the position of the alignment plate operates in the main scan direction on the relay stacker (RU).

(2) Usage

Adjust it when the punch holes are misarranged in the main scan direction.

(3) Procedure

- "Service Mode Menu screen"
 Press [11 Finisher Adjustment].
- "Service Mode Menu screen"
 Press [10 Relay Stacker Adjustment].
- "Relay Stacker Adjustment Menu screen"
 Press [01 Paper Width Adjustment].
- "Paper Width Adjustment screen"
 Press [▼] or [▲] to select the paper size.
 Select the size of paper from the following options.
 All Size
 SRA3, A3, A3W, B4, B4W, SRA4, A4, A4S, A4W, A4WS, B5, B5W, A5, A5W
 12×18 , 12×18 W, 11×17 , 11×17 W, 9×11 , $8\frac{1}{2} \times 14$, $8\frac{1}{2} \times 11$, $8\frac{1}{2} \times 11$ S, $8\frac{1}{2} \times 11$ W, $8\frac{1}{2} \times 11$ WS,
 $5\frac{1}{2} \times 8\frac{1}{2}$, $5\frac{1}{2} \times 8\frac{1}{2}$ W, 8×13 , $8\frac{1}{8} \times 13\frac{1}{4}$, $8\frac{1}{4} \times 13$, $8\frac{1}{2} \times 13$
 8K, 16K, 16KS
 Custom
- Press [Print Mode].
- Set 10 sheets of paper with a size to be adjusted.
 Set the setting to "10" to set the punch.
 Press the start button.
- Check the diameter of the through-hole when the ejected paper is stacked.

Holes	Standard value (mm)
2-Holes	φ5.0 or larger
3-Holes	φ6.5 or larger

- When the value is not within the standard value, press [Close].
- "Paper Width Adjustment screen"
 Enter a value through the numeric buttons and press [SET].
 Adjustment range: -20 (narrow) to + 20 (wide), 1 step = 0.1mm

Note

- For adjusting it, be sure to find the alignment point where the punch holes are not misarranged by setting the value to the maximum (wide) first and then changing it to narrower.

- Repeat the steps 4 to 9 until an appropriate value is obtained.

5.13.51 RU-510 Paper Length Adjustment (Relay Stacker Adjustment)**(1) Functions**

Adjust the position of the alignment plate operates in the sub scan direction on the relay stacker (RU).

(2) Usage

Adjust it when the punch holes are misarranged in the paper path direction.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [10 Relay Stacker Adjustment].
3. "Relay Stacker Adjustment Menu screen"
Press [02 Paper Length Adjustment].
4. "Paper Length Adjustment screen"
Press [▼] or [▲] to select the paper size.
Select the size of paper from the following options.
All Size
SRA3, A3, A3W, B4, B4W, SRA4, A4, A4S, A4W, A4WS, B5, B5W, A5, A5W
12 x 18, 12 x 18W, 11 x 17, 11 x 17W, 9 x 11, 8¹/₂ x 14, 8¹/₂ x 11, 8¹/₂ x 11S, 8¹/₂ x 11W, 8¹/₂ x 11WS,
5¹/₂ x 8¹/₂, 5¹/₂ x 8¹/₂W, 8 x 13, 8¹/₈ x 13¹/₄, 8¹/₄ x 13, 8¹/₂ x 13
8K, 16K, 16KS
Custom
5. Press [Print Mode].
6. Set 10 sheets of paper with a size to be adjusted.
Set the setting to "10" to set the punch.
Press the start button.
7. Check the diameter of the through-hole when the ejected paper is stacked.

Holes	Standard value (mm)
2-Holes	φ5.0 or larger
3-Holes	φ6.5 or larger

8. When the value is not within the standard value, press [Close].
9. "Paper Length Adjustment screen"
Enter a value through the numeric buttons and press [SET].
Adjustment range: -50 (narrow) to + 50 (wide), 1 step = 0.1mm

Note

- For adjusting it, be sure to find the alignment point where the punch holes are not misarranged by setting the value to the maximum (wide) first and then changing it to narrower.

10. Repeat the steps 4 to 9 until an appropriate value is obtained.

5.13.52 PI-PFU Tray Adjustment (PI-PFU Adjustment)**(1) Functions**

Adjust the paper remaining VR detection of PI-PFU each trays.

(2) Usage

Adjust it when the paper remaining detection of the PI-PFU each tray does not work properly.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [11 PI-PFU Adjustment].
3. "PI-PFU Adjustment Menu screen"
Press [01 Tray adjustment].
4. "PI-PFU Tray Adjustment Menu screen"
Press [01 Tray Amount Detection Adj.].
5. "Tray Amount Detection Adjustment screen"
Select [LOW] of the trays you want to adjust.
6. Pull out the selected tray and remove all paper.
7. Set the tray.
8. Press [Start].
After the adjustment, the message "Complete" appears.
9. "Tray Amount Detection Adjustment screen"
Select [UP] of the trays you want to adjust.
10. Pull out the selected tray and set 1 piece of paper.
11. Set the tray.
12. Press [Start].
After the adjustment, the message "Complete" appears.

13. To adjust the other trays, repeat steps 4 to 12.

5.13.53 PI-PFU Pre-registration Adjustment (PI-PFU adjustment)

(1) Functions

Adjust the paper loop amount in the registration roller section of the PI-PFU.

(2) Usage

Adjust when the paper skew or crease occurs.

(3) Procedure

- "Service Mode Menu screen"
Press [11 Finisher Adjustment].
- "Service Mode Menu screen"
Press [11 PI-PFU Adjustment].
- "PI-PFU Adjustment Menu screen"
Press [02 Pre-registration Adjustment].
- "Pre-registration Adjustment screen"
Select the item you adjust since the tray is adjusted by each (PI-PFU 1 to 3).
- "Pre-registration Adjustment screen"
Enter a numeric value through the numeric keys and press [Set].
Setting range: -10 (small) to +10 (large)
1 step = 1msec
- Check the skew or crease on paper in the normal mode.

Note

- Since the test print cannot be done from the service mode, check it in the normal mode which uses PI-PFU.

- Repeat the steps 4 to 6 until an appropriate value is obtained.

5.13.54 ZU-608 Z-Folding Position Adjustment (Z-Folding Unit Adjustment)

(1) Functions

Adjust the fold position on the Z-Fold position.

(2) Usage

Conduct this adjustment when the fold position on the Z-Fold position is not within the standard value

Note

- When adjusting both the 1st fold and the 2nd fold, be sure to start with the 1st fold.
- The position of the 1st fold is based on the leading edge of paper and the position of the 2nd fold is based on the position of the 1st fold. So, the dimension "b" in the step8 varies when either position of the 1st fold and the 2nd fold is changed.

(3) Procedure

- "Service Mode Menu screen"
Press [11 Finisher Adjustment].
- "Service Mode Menu screen"
Press [05 Z-Folding Unit Adjustment].
- "Z-Folding Unit Adjustment Menu screen"
Press [01 Z-Fold Position Adjustment].
- "Z-Fold Position Adjustment screen"
Press [1st Fold] or [2nd Fold].
- "Z-Fold Position Adjustment screen"
Select the paper size that you want to adjust.
- Press [Print Mode].
- Set paper in size that you want to adjust on the Tray and press the Start key to output the test pattern (No.16).
- Confirm "a" and "b" on the output paper.

Paper Size	Standard value (mm)	
	a	b
A3	4.0 ± 2.0	202 to 209
B4		174 to 181
11×17		208 to 215
8 1/2×14	-	234.5 to 241.5
8K	4.0 ± 2.0	187 to 194

* 8 1/2×14 supports only folded in 2.

[1] 1st folding	[2] 2nd folding
-----------------	-----------------

9. When the value is not within the standard value, press [Close].
10. "Z-Fold Position Adjustment screen"
Select the paper size that you want to adjust.
11. Press [1st Fold].
12. "Z-Fold Position Adjustment screen"
Enter the setting data through the numeric buttons and press [<<Set].
Range: -128 (shorter) to +127 (longer)
1 step = 0.1mm
 - The dimension "a" in the step8 gets larger when the setting data is moved to the positive side and gets smaller when moved to the negative side.
13. Press [2nd Fold].
14. "Z-Fold Position Adjustment screen"
Enter the setting data through the numeric buttons and press [<<Set].
Range: -128 (shorter) to +127 (longer)
1 step = 0.1mm
 - The dimension "b" in the step8 gets larger when the setting data is moved to the positive side and gets smaller when moved to the negative side.
15. Repeat steps 6 to 14 until the standard value can be obtained.

5.13.55 ZU-608 Vertical position adjustment (Crosswise Dir.) (Z-Folding Unit Adjustment)

(1) Functions

Adjust the punch position of ZU in the main scan direction.

(2) Usage

Conduct this adjustment when the punch position of ZU in the main scan direction is not within the standard value.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [05 Z-Folding Unit Adjustment].
3. "Z-Folding Unit Adjustment Menu screen"
Press [02 Punch Adjustment].
4. "Punch Adjustment Menu screen"
Press [01 Vert. Position Adj.(CD)].
5. "Punch Vert. Position Adj.(CD) screen"
Press [▼] or [▲] to select the paper size that you want to adjust.
6. Press [Print Mode].
7. Set paper in size that you want to adjust on the Tray and press the Start key to output the test pattern (No.16).
8. Fold the output paper in half in the main scan direction, and measure the gap "a" between the center line of the print and the center of the punch hole.
Standard value "a": 0mm ± 2mm

[1] Center of the paper	[2] Center of the punch hole
-------------------------	------------------------------

9. When the value is not within the standard value, press [Close].
10. "Punch Vert. Position Adj.(CD) screen"
Enter the setting data through the numeric buttons and press [<<Set].
Range: -50 (to front) to +50 (to back)
1 step = 0.1mm
11. Repeat steps 6 to 10 until the standard value can be obtained.

5.13.56 ZU-608 Horizontal position adjustment (paper feed direction) (Z-Folding Unit Adjustment)

(1) Functions

Adjust the punch position of ZU in the sub scan direction.

(2) Usage

Conduct this Adjustment when the punch position of ZU in the sub scan direction is not within the standard value.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].

2. "Service Mode Menu screen"
Press [05 Z-Folding Unit Adjustment].
3. "Z-Folding Unit Adjustment Menu screen"
Press [02 Punch Adjustment].
4. "Punch Adjustment Menu screen"
Press [02 Horiz. Position Adj. (FD)].
5. "Punch Horiz. Position Adj.(FD) screen"
Press [Print Mode].
6. Set paper in the tray or PI, and press Start key to print the test pattern (No.16).
7. Check the punch position "a" of the output paper in the sub scan direction.
Standard value "a":
- Inch area: 9.5mm \pm 5.0mm
- Metric area: 10.5mm \pm 5.0mm

8. When the value is not within the standard value, press [Close].
9. "Punch Horiz. Position Adj.(FD) screen"
Enter the setting data through the numeric buttons and press [<<Set].
Range: -50 (shorter) to +50 (longer)
1 step = 0.1mm
10. Repeat steps 5 to 9 until the standard value can be obtained.

5.13.57 ZU-608 Punch Registration Loop Adjustment (Z-Folding Unit Adjustment)

(1) Functions

Adjust the registration loop amount while in punching.

(2) Usage

Conduct this adjustment when punch skew, crease or paper jam at the punch registration section occurs.

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [05 Z-Folding Unit Adjustment].
3. "Z-Folding Unit Adjustment Menu screen"
Press [02 Punch Adjustment].
4. "Punch Adjustment Menu screen"
Press [03 Punch Registration Loop Adj.].
5. "Punch Registration Loop Adjustment screen"
Select the item that you want to adjust and press [Print Mode].
6. Set paper in the tray or PI, and press Start key to print the test pattern (No.16).
7. When the trouble is not solved, press [Close].
8. "Punch Registration Loop Adjustment screen"
Enter the setting data through the numeric buttons and press [<<Set].
Range: -20 (smaller) to +20 (larger)
1 step = 0.8mm
9. Repeat the steps 4 to 7 until an appropriate value is obtained.

5.13.58 ZU-608 Punch Edge Sensor Adjustment (Z-Folding Unit Adjustment)

(1) Functions

Adjust the sensitivity of the paper edge sensor automatically to detect the paper edge to ensure properly place the punch holes.

(2) Usage

Adjust the sensitivity of the sensor after replacing the ZU control board of ZU (ZUCB) or the paper edge sensor board (PESB).

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [05 Z-Folding Unit Adjustment].
3. "Z-Folding Unit Adjustment Menu screen"

- Press [02 Punch Adjustment].
- 4. "Punch Adjustment Menu screen"
Press [04 Punch Edge Sensor Adjustment].
- 5. "Punch Edge Sensor Adjustment screen"
Press [Start].
- 6. A message "Completed" is displayed when the adjustment is finished successfully.

5.13.59 Recall Standard Data

(1) Functions

Reset various setting values of the finisher adjustment to the factory initial data or the installation initial data.

(2) Usage

Conduct this adjustment when the initialization cannot be done because of the various change in the finisher adjustment items by CE.

Note

- **For Stacker Adjustment (LS), Trimmer Receiver Adjustment (SD), Stapler (Main) Adjustment (FS-532), Stapler (Fold) Adjustment (SD-510), Stapler (Punch) Adjustment (PK-522), Stapler (PI) Adjustment (PI-502), and Punch Edge Sensor Adjustment (ZU-608), the data cannot be recalled.**

(3) Procedure

1. "Service Mode Menu screen"
Press [11 Finisher Adjustment].
2. "Service Mode Menu screen"
Press [13/06 Recall Standard Data].
3. "Recall Standard Data Finisher adj. screen"
Press [Factory Initial Data] or [Installation Initial Data].

Note

- **Selecting [Factory Initial Data] recalls the factory initial data.**
- **Selecting [Installation initial data] recalls the adjustment values stored when code "90-00" of the I/O check mode was conducted.**

5.14 IC HDD format

Format the hard disk /2 (HDD2) on the print controller.

Formatting enables you to secure space/delete internal data.

5.14.1 Procedure

1. "Service Mode Menu screen"
Press [12 IC HDD Format].
2. "Service Mode Menu screen"
Press [01 IC HDD Format].
3. HDD format includes the following 5 items.
 - [All]
 - [Document]
 - [Parameter]
 - [Font]
 - [Spool]
4. Press the item you want to format.
5. "Format confirmation screen"
The message "Execute format Yes/No?" is displayed.
Press [Yes].

5.14.2 Purpose of each item

1. [All]
Formats all areas of the hard disk.
This operation is equal to performing the following 4 operations at once. Conduct this operation on such occasions as replacing the hard disk /2 (HDD2).
2. [Document]
Formats the document storage area. Conduct this operation when deleting the Scan to HDD job.
3. [Parameter]
Formats the storage area for the controller setting information.
Conduct this operation when deleting the whole setting information on the print controller (the network setting and default settings of each port, and so on).

Note

- **Be sure to output the settings information list before formatting parameters.**

4. [Font]
Formats the font data storage area.
Conduct this operation when deleting downloaded external font data.

Note

- **By formatting, all downloaded external fonts are deleted.**

5. [Spool]
Formats the spool area.
There is no need to format this area alone.

5.15 Setting data

5.15.1 Read from external memory

(1) OUTLINE

Stores each setting information stored in NVRAM board (NRB) from the machine to the USB memory and writes it from the USB memory to the machine. However, the setting data cannot be edited since it is encrypted.

(a) Setting information which is able to store/write

Data items	Data content
Paper setting data	Tray setting
	Paper Setting Register/Delete
	Register/Delete custom size
Setting menu data	Setting menu
Software DIPSW setting data	Software DIPSW
CSRC Setting Data	CSRC Setting

(2) Preparation:

Connect the USB memory to the main body connection port.

(3) Procedure

- "Service Mode Menu screen"
Press [14 Setting Data].
- "Service Mode Menu screen"
Press [01 Read from external memory].

Note

- If the USB memory is not connected to the connection port, the error message appears not to go on to the file selection screen.

- "Setting Data<Read from External Memory> screen"
Press [Next] or [Back] to select the file to be read and press [OK].

Note

- By pressing [Limit], only the file corresponded to the serial number of the machine appears.

- "Setting Data<Read from External Memory> screen"
Select the data to be read from [Paper Setting Data]/[Utility data]/[Software DIPSW Setting Data]/[CSRC Setting Data] and press [Start Reading].
- "Pop-up screen"
Press [Yes] to start reading the setting data.

Note

- Be sure not to turn OFF the main power switch (SW1) until the reading file completes.

- "Setting Data <Read from external memory> screen"
To read another setting data, press [Yes]. To finish the procedure, press [No].

Note

- By pressing [No], the machine restarts automatically.

5.15.2 Store to external memory

(1) Functions

Store the setting data from NRB to the USB memory.

(2) Preparation:

Connect the USB memory to the main body connection port.

(3) Procedure

- "Service Mode Menu screen"
Press [14 Setting Data].
- "Service Mode Menu screen"
Press [02 Store to External Memory].
- "Setting Data <Store to External Memory> screen"
Press [Start Storing].

Note

- Be sure not to turn OFF the main power switch (SW1) until the storing file completes.

4. Press [OK] to return to "Setting Data <Store to External Memory screen".

(4) Folder structure of USB memory

When storing data to the USB memory and the folder is not created, it creates the next folder automatically. 4 models 1250/1250P/1052/951 share this folder.

**(5) Error list**

If the error occurs for reading from the external memory or for storing to the external memory, the error message appears. Confirm that " is displayed in the message display area.

Message	Cause of occurrence
Connection of an external memory device cannot be recognized.	1) The initialization of the USB device is not completed. 2) The USB memory is not connected to the connection port.
Could not be stored to external memory	3) Prohibit to write to the USB memory 4) Capacity shortage of the USB memory 5) Unable to execute the compression from the binary data to the ZLIB compressed data. 6) Unable to encrypt AES.
Could not be read from external memory	7) Data error on the header (2nd line) 8) Checksum abnormality 9) Unable to execute the replacement from the BASE64 data to the AES encrypt data. 10) Unable to execute the compounding of AES. 11) Unable to execute the extension from the ZLIB compressed data to the binary data.

5.15.3 Size setting rewrite**(1) Function**

Switch all setting values related to the paper size (DIPSW14-5, the user zoom setting, and size information of B series paper)

(2) Usage

When installing the main body, specify the settings that is related to the paper size to the JIS series or ISO series.

(3) Procedure

1. "Service Mode Menu screen"
Press [14 Setting Data]
2. "Service Mode Menu screen"
Press [03 Size Setting Rewrite].
3. "Size Setting Rewrite screen"
If the B size is switched from the JIS series to the ISO series, press the [B series (JIS) -> B series (ISO)]

Note

- [B series (ISO) -> B series (JIS)] is used only when JIS series is mistakenly selected. Usually do not use this setting.
- If this setting is configured, the user zoom setting value is initialized so that the zoom setting data registered by the user is deleted.

4. A pop-up message [The size setting is rewritten Yes/No ?] appears. Select either [Yes] or [No].

5.16 Log Store**5.16.1 Log Store Setting****(1) Usage**

Set the Log Store method for troubleshooting.

(2) Procedure

1. "Service Mode Menu screen"
Press [15 Log Store].
2. "Service Mode Menu screen"
Press [01 Log Store Setting].
3. "Log Store Setting screen"
Set each item.
 - "Store To"
Press [USB Memory] or [HDD].

Note

- When DIPSW18-7 is set to "1", the log cannot be stored on the HDD.

- "Encryption Password" setting

Note

- When [USB Memory] is selected on "Store To", only [ON] can be selected for "Encryption Password".

1. Press [ON].

2. "Encryption Password Input screen"

Input the password and press [OK].

Note

- The default password is "0000".
- Input the password within 16-digit.

- "Auto Log Store"

When "Auto Log Store" is set to "ON", the log is automatically stored when SC (except for HDD related SC) occurs.

Note

- Store condition

If the root directory does not have any dedicated directory for the Log Store of the serial No., the dedicated directory is created. Then an appropriate log is stored (Encryption zip) under the dedicated directory depending on the File Name which is created from Date, Time and SC Number.

Example:

/xxxxxxx/201001070925SC_48_50.zip

* xxxxxxx is the serial No.

- 100 logs can be stored at the maximum. Be sure to clear the log file when the number exceeds 100. (Refer to [I.5.16.2 Execute Log Storing](#))
 - When "USB Memory" is selected on "Store To" and the USB memory is not connected to the service port, the log is not stored automatically.
 - "Manual Log Store"
- When "Manual Log Store" is set to "ON", the log can be stored manually by [I.5.16.2 Execute Log Storing](#).
- Note**
- When "Manual Log Store" is set to [ON], [Log Store] button is displayed on "System Information" screen of Utility. User can collect the log with this button.

5.16.2 Execute Log Storing

(1) Usage

Store the log for trouble shooting manually.

Note

- When DIPSW18-7 is set to "1", the log cannot be stored on the HDD.
- 100 logs can be stored at the maximum. Be sure to clear the log file when the number exceeds 100.
- With the file name created from the date and time, the log is stored (encrypt zip) in the Log directory.

(2) Procedure

1. "Service Mode Menu screen"

Press [15 Log Store].

2. "Service Mode Menu screen"

Press [02 Execute Log Storing].

3. "Execute Log Storing screen"

The operation differs depending on the "Store To" setting in [I.5.16.1 Log Store Setting](#).

When USB memory is set as destination to which log is stored

- [Manual Log Store]: Stores the log in the USB memory.
 1. Press [Manual Log Store].
 2. [USB Memory Connection screen]

Connect the USB memory to the service port and press [OK].
- [Transfer to USB Memory]: Cannot be selected.
- [Clear Log File]: Clears the log in the USB memory.
 1. Press [Clear Log File].
 2. [USB Memory Connection screen]

Connect the USB memory to the service port and press [OK].

When HDD is set as destination to which log is stored

- [Manual Log Store]: Stores the log in HDD.
 1. Press [Manual Log Store].
- [Transfer to USB Memory]:

Transfers the log stored in the HDD to the route directory of the USB memory.

 1. Press [Transfer to USB Memory].
 2. [USB Memory Connection screen]

Connect the USB memory to the service port and press [OK].
- [Clear Log File]: Clears the log in the HDD.
 1. Press [Clear Log File].
 2. "Clear Log File screen"

Press [OK].

5.17 Auth. Device Setting

5.17.1 Auth. Unit Selection

(1) Usage

- Set the authentication device set/unset.

- Set this setting when set the authentication device (IC card authentication type).

(2) Procedure

1. "Service Mode Menu screen"
Press [16 Auth. Device Setting].
2. "Service Mode Menu screen"
Press [01 Auth. Unit Selection].
3. "Authentication Device Setting <Authentication Device Selection> screen"
Default is "Unset." Press [Authentication Device].
4. "Authentication Device Setting <Authentication Device Selection> screen"
Press [Card 1] or [Card 2].

Card 1	Use the IC Card Authentication type. (Standard)
Card 2	Use the non-contact IC Card Authentication type from third party. (Load)

- Be sure to conduct ISW of "Loadable Device Driver" before using the Card 2.
 - Be sure to turn OFF/ON the main power switch (SW1), after the Card 2 is set.
5. "Authentication Device Setting <Authentication Device Selection> screen"
Press [OK].

5.17.2 Loadable Driver Install

(1) Function

- Install the Loadable Device Driver by the USB Memory device.

(2) Usage

- As the default, the card reader driver of AU-201 is installed. When use a card reader other than AU-201, install the dedicated Loadable Device Driver.

(3) Preparation:

Connect the USB Memory which is written the drive data of the Loadable Device to be used into the connecting port.

Note

- **Be sure to connect the USB Memory while the main power switch and the sub power switch are OFF.**

(4) Procedure

1. Turn on the main power switch and the sub power switch.
2. "Service Mode Menu screen"
Press [16 Auth. Device Setting].
3. "Service Mode Menu screen"
Press [02 Loadable Driver Install].
4. "Firmware Update screen"
Press [Start] to start installing the Loadable Driver.
5. "Firmware Update screen"
A message to inform the install completion ("Download Completed") and checksum (xxxx) is displayed.
6. Turn off the main power switch and the sub power switch.
7. Remove the USB memory from the connecting port.
8. Turn on the main power switch and the sub power switch.

5.18 ORU-M Setting (1250/1250P/1052 only)

5.18.1 ORU-M Target Setting

(1) Usage

Set the ORU-M Item unit.

Note

- **ORU-M has to be enabled to select this setting. (The default is disabled.) To enable ORU-M, set DIPSW15-0: 1.**

(2) Procedure

1. "Service Mode Menu screen"
Press [17 ORU-M Setting].
2. "Service Mode Menu screen"
Press [01 ORU-M Item Setting].
3. "ORU-M Item Setting screen"
To set ORU-M Item, press [Enable] for the unit to register.

Note

- **The Fusing Cleaning Web and the Fusing Unit cannot be set to [Enable] at the same time.**

5.18.2 ORU-M Life Threshold Setting

(1) Usage

Set whether to display the ORU-M Item unit in the ORU-M Mode by the life value. Set the threshold with percent.

When the ORU-M object unit is set to "Enable", the units whose life value reaches the display threshold setting are displayed in the ORU-M mode.

Note

- **ORU-M has to be enabled to select this setting. (The default is disabled.) To enable ORU-M, set DIPSW15-0: 1.**

(2) Procedure

1. "Service Mode Menu screen"
Press [17 ORU-M Setting].
2. "Service Mode Menu screen"
Press [02 ORU-M Life Threshold Setting].
3. "ORU-M Life Threshold Setting screen"
Enter a value through the numeric buttons and press [<<SET].
 - 1 step = 1%
 - **Note**
 - **Default is 0%.**

5.18.3 ORU-M Password Setting**(1) Usage**

Set the password to enter the ORU-M Mode.

Note

- **ORU-M has to be enabled to select this setting. (The default is disabled.) To enable ORU-M, set DIPSW15-0: 1.**
- **This setting is valid when the DIPSW43-0=1.**

(2) Procedure

1. "Service Mode Menu screen"
Press [17 ORU-M Setting].
2. "Service Mode Menu screen"
Press [03 ORU-M Password Setting].
3. "ORU-M Password Setting screen"
Press [New Password], then a keyboard screen appears. Enter new password (4 digits) using the alphanumeric keys and then press [OK].
4. Press [Input Confirmation], then a keyboard screen appears. Enter new password (4 digits) using the alphanumeric keys again and then press [OK].

6. FEE COLLECTION SETTING

6.1 Fee Collection Setting List

Adjustment/Setting Item	
Billing Setting	01 Manage OpenAPI Auth.
	02 Billing Counter Coef. Set.

6.2 Start/exit

(1) Usage

Set up the various settings concerning the Billing Setting from the "Billing Setting Menu screen".

(2) Procedure

- "Service Mode Menu screen"
Before selecting any item in the service mode, press the hard keys in the order shown below.
Stop → 9
- "Billing Setting Menu screen"
Billing setting mode is activated. Set the various billing setting.
- "Billing Setting Menu screen"
Select the item to be set to display the setting screen of each item.
- "Billing Setting Menu screen"
Press [Close] to return to the "Service Mode screen."

6.3 Manage OpenAPI Auth.

6.3.1 Restriction Code

(1) Function

- Register [Index], [Vendor] and [Application] to the restriction code.
 - Maximum 8 one-byte alphanumeric characters can be registered.
 - Maximum 10 codes can be registered.

(2) Usage

- This setting is a communication setting with an application which developed by other companies. Do not change this setting without using.

6.4 Billing Coefficient Setting

(1) Usage

Set the count coefficient for each paper type and size of the billing counter.

The counting method differs depending on the customer. In order to cope with this situation, change the coefficient.

Note

When the coefficient is changed, the count value of the billing coefficient differs from actual number of printed sheets.

(2) Functions

Set the calculation of the billing counter that is displayed on Web Utilities and the coefficient to display the counter.

Note

In case of 1250/1250P/1052, the default setting of DIPSW8-6 is "1".

· In case of 951, set DIPSW8-6=1 to display this screen.

When the coefficient setting value is changed, the total value of the Web Utilities and the billing total counter value differ because of the following approach.

For the display on the Web Utilities, since the main body sends each counter and calculates on Web Utilities, new coefficient is used for the counter before changing the coefficient to calculate.

Since the display on the main body panel is calculated and accumulated for each output page, the coefficient after the change is used only for the output after the change when the coefficient is changed. (The counter before changing the coefficient is not changed.)

(3) Procedure

- "Billing Setting Menu screen"
Press [02 Billing Counter Coef. Set.].
- "Billing Counter Coef. Setting screen"
Press the number to be set from the Table of combination of Paper Type and Paper length to select.
Items can be set for 951

Type of paper	Paper length (In paper feed direction)			
	Less than 298mm	Between 298mm and 331mm	Between 331mm and 391mm	391mm or more
Plain	1.0 to 4.0	1.0 to 4.0	1.0 to 4.0	1.0 to 4.0

Items can be set for 1250/1250P/1052

Type of paper	Paper length (In the paper feed direction)			
	Less than 298mm	Between 298mm and 331mm	Between 331mm and 391mm	391mm or more
Plain	1.0 to 4.0	1.0 to 4.0	1.0 to 4.0	1.0 to 4.0

Embossed2	1.0 to 4.0	1.0 to 4.0	1.0 to 4.0	1.0 to 4.0
Envelope	1.0 to 4.0	1.0 to 4.0	1.0 to 4.0	1.0 to 4.0

3. Enter a value with the numeric buttons.
 - Setting Range
: 1.0 to 4.0
4. To set other coefficient, repeat steps 2 to 3.
5. Press [OK] to activate the setting, and the "Billing Setting Menu screen" is displayed.
Press [Cancel] to cancel updating.

7. CE/ADMINISTRATOR SECURITY SETTING

7.1 CE/Administrator Security Setting List

Adjustment/setting item	
CE/Administrator Security Setting	01 CE Authentication
	02 Authentication Password
	03 Admin. Authentication
	04 Machine Manager Password

Important

Conditions for setting the security enhance mode to ON

- **CE Authentication: [ON]**
- **Administrator Authentication: [ON]**
- DIPSW40-0-1 (Carrying over the job for next day: Disabled)
- DIPSW16-7-0 (NIC of E-Mail CS Remote Care: Use the controller NIC)
- Removal HDD is not used

7.2 Start/exit

(1) Usage

The CE/Admin. Security Setting Menu can be set on the "CE/Admin. Security Setting Menu screen" in the CE/Admin. Security Mode.

(2) Procedure

1. "Service Mode Menu screen"
Before selecting any item in the service mode, press the hard keys in the order shown below.
Stop → 0 → C
2. "CE/Administrator Security Setting Menu screen"
The CE/Administrator security mode starts up and the CE/Administrator Security Setting becomes available.
3. "CE/Administrator Security Setting Menu screen"
Select the item to be set to display the setting screen of each item.
4. "CE/Administrator Security Setting Menu screen"
Press [Close] to return to the "Service Mode screen."

Important

- The setting [06 Administrator Setting] in [07 Security Setting] in [03 Enhanced Security Mode] is available only when the CE Authentication and Admin. Authentication are set to [ON].

7.3 CE Authentication

(1) Usage

To strengthen security of the service mode, configure the setting so that a password is required to enter the service mode.

Note

To set the security enhance mode ON, this setting has to be "ON".

(2) Procedure

1. "CE/Administrator Security Setting Menu screen"
Press [01 CE Authentication].
2. "CE Authentication ON/OFF screen"
Press [ON] or [OFF].
3. When [OK] is pressed, the setting becomes valid and "CE/Administrator Security Setting Menu screen" is displayed.
4. Press [Cancel] to cancel updating.

7.4 CE Auth. Password

(1) Usage

Configure a password to enter the service mode.

Note

- Do not use anything easily guessed by others such as your name, birthday.
- CE should not inform other people of the password.
- The selection of the [CE Authentication Password] key is limited to only when the CE authentication setting is set to [ON].

(2) Procedure

1. "CE/Administrator Security Setting Menu screen"
Press [02 CE Authentication Password].
2. "CE Authentication Password screen"
Press [Current Password], then a keyboard screen appears. Enter the current password (8 digits) using the alphanumeric keys and then press [OK].
Default is "92729272."
When entering wrong password, the message "Password is incorrect" is displayed.
3. Press [New Password], then a keyboard screen appears. Enter new password (8 digits) using the alphanumeric keys and then press [OK].
4. Press [Input Confirmation], then a keyboard screen appears. Enter new password (8 digits) using the alphanumeric keys again and then press [OK].
5. "CE Authentication Password screen"
When [OK] is pressed, the setting becomes valid and "CE/Administrator Security Setting Menu screen" is displayed.

Press [Cancel] to cancel updating.

7.5 Admin. Authentication

(1) Usage

To strengthen security of the machine manager setting of the setting menu mode, configure the setting so that a password is required to enter the machine manager setting.

Note

To set the security enhance mode ON, this setting has to be "ON".

(2) Procedure

1. "CE/Administrator Security Setting Menu screen"
Press [03 Admin. Authentication].
2. "Admin. Authentication ON/OFF Setting screen"
Press [ON] or [OFF].
3. When [OK] is pressed, the setting becomes valid and "CE/Administrator Security Setting Menu screen" is displayed.
Press [Cancel] to cancel updating.

7.6 Administrator Password

(1) Usage

Configure a password to enter the Administrator Setting of the Utility.

The administrator password can also be set in the Administrator Setting of the Utility.

Note

- **When setting or changing the administrator password, CE must ask the administrator of the customer to change the administrator password promptly.**
- **Do not use anything easily guessed by others such as your name, birthday.**
- **The selection of the [Administrator Password] key is limited only when the Admin. Authentication setting is set to [ON].**

(2) Procedure

1. "CE/Administrator Security Setting Menu screen"
Press [04 Administrator Password].
2. "Administrator Password screen"
3. Press [New Password], then a keyboard screen appears. Enter new password (8 digits) using the alphanumeric keys and then press [OK].
Press [OK].
4. Press [Input Confirmation], then a keyboard screen appears. Enter new password (8 digits) using the alphanumeric keys again and then press [OK].
5. "Administrator Password screen"
When [OK] is pressed, the setting becomes valid and "CE/Administrator Security Setting Menu screen" is displayed.
Press [Cancel] to cancel updating.

8. ADJUSTMENT FOR POD

8.1 Process adjustment

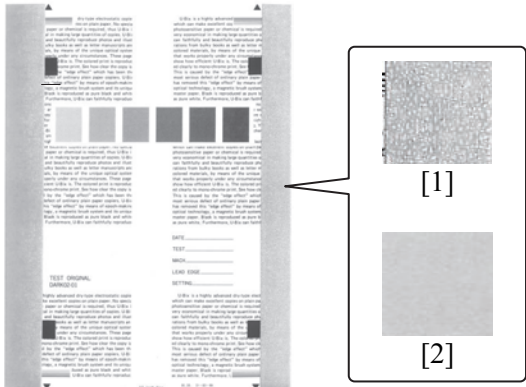

8.1.1 OUTLINE

This adjustment shows the directions of each adjustment of [Process Adjustment] that is displayed in the [Tray Setting]. When adjusting each item, check the problem, the paper on which it tends to occur, the paper weight and the environment in which it tends to occur to make a proper adjustment.

Separate setting can be set for each tray by setting offset to the adjustment value set in this setting. However, since it is possible that a trouble such as image fault occurs when excessive adjustment is performed, adjust carefully.

8.1.2 Image Trouble sample of genesis phenomenon

(1) Transfer repelling

[1] Image with transfer repelling	[2] Normal image
-----------------------------------	------------------

The transfer repelling is a symptom where the toner transferred by the discharge at the paper is flicked out when the transfer field becomes too excessive.

(2) poor transfer

[1] Poor transfer image	[2] Normal image
-------------------------	------------------

Poor transfer is a symptom where the toner transfer to the paper is insufficient by the shortage of the transfer field.

(3) Discharge image noise

[1]	Discharge image noise (Leading edge of the back side)	[2]	Discharge image noise (Middle of the back side)
-----	---	-----	---

(4) NCR paper with the color changed

[1]	Trails of rollers	-
-----	-------------------	---

A symptom that the overlapped NCR papers conveyed by RU-510 changes in color by the roller pressure of post-processing option.
(1250/1250P only)

(5) Transfer missing on the paper depressed part

[1]	Transfer missing on the depressed part	-
-----	--	---

Transferability is degraded at the depressed part of the paper with a rough surface like Embossed2, and the amount of the tonar attached on the surface decreases.

(6) Dark image density

[1]

[2]

[1] Image in the Embossed setting

[2] Image in the Embossed2 setting

By comparing the images both in the embossed setting and in the embossed2 setting, the halftone is darker in the embossed2 setting. Therefore, the tone jump may occur on the image with the continuous tone.

8.1.3 Transfer Offset Adjustment (Offset Lead Edge 1(Front))

(1) Measure taken according to cause

1. Drum separation error
 1. Paper on which it tends to occur
 - Unidentified
 2. Paper weight
 - 40 g/m² to 91 g/m²
 3. Environment in which it tends to occur
 - High to normal humidity condition
 4. Adjustment method
 1. Adjust to the positive side
 2. Adjust positively by 10steps until the proper condition can be obtained.
 Setting Range
: - 128 to + 127
 5. Precaution related to other adjustments
 - When the steps are moved too much in plus direction, the transfer repelling or belt separation error is possible to occur.
 - Enter the same value as "1.8.1.5 Transfer Offset Adjustment (Offset Lead Edge 2(Front))".
 - Change the edge1 and edge2 at the same time
2. Belt separation error
 1. Paper on which it tends to occur
 - Unidentified
 2. Paper weight
 - 40 g/m² to 61 g/m²
 3. Environment in which it tends to occur
 - Unidentified
 4. Adjustment method
 1. Adjust to the negative side
 2. Adjust negatively by 10steps until the proper condition can be obtained.
 Setting Range
: - 128 to + 127
 5. Precaution related to other adjustments
 - When the steps are moved too much in minus direction, it is possible that the density decrease or the drum separation error occur because of the poor transfer.
 - Enter the same value as "1.8.1.5 Transfer Offset Adjustment (Offset Lead Edge 2(Front))".
 - Change the edge1 and edge2 at the same time
3. Discharge image noise (Pedatfid)
 1. Paper on which it tends to occur
 - Unidentified
 2. Paper weight
 - 40 g/m² to 61 g/m²
 3. Environment in which it tends to occur
 - Low humidity environment
 4. Adjustment method
 1. Adjust to the positive side
 2. Adjust positively by 10steps until the proper condition can be obtained.
 Setting Range
: - 128 to + 127
 5. Precaution related to other adjustments
 - When the steps are moved too much in plus direction, the transfer repelling or belt separation error is possible to occur.

- Enter the same value as "[I.8.1.5 Transfer Offset Adjustment \(Offset Lead Edge 2\(Front\)\)](#)".

8.1.4 Transfer Offset Adjustment (Offset Lead Edge 1(Back))

(1) Measure taken according to cause

- Drum separation error
 - Paper on which it tends to occur
 - Unidentified
 - Paper weight
 - 40 g/m² to 91 g/m²
 - Environment in which it tends to occur
 - High to normal humidity condition
 - Adjustment method
 - Adjust to the positive side
 - Adjust positively by 10steps until the proper condition can be obtained.
Setting Range
: - 128 to + 127
 - Precaution related to other adjustments
 - When the steps are moved too much in plus direction, the transfer repelling or belt separation error is possible to occur.
 - Enter the same value as "[I.8.1.6 Transfer Offset Adjustment \(Offset Lead Edge 2\(Back\)\)](#)".
 - Change the edge1 and edge2 at the same time
- Belt separation error
 - Paper on which it tends to occur
 - Unidentified
 - Paper weight
 - 40 g/m² to 61 g/m²
 - Environment in which it tends to occur
 - Unidentified
 - Adjustment method
 - Adjust to the negative side
 - Adjust negatively by 10steps until the proper condition can be obtained.
Setting Range
: - 128 to + 127
 - Precaution related to other adjustments
 - When the steps are moved too much in minus direction, it is possible that the density decrease or the drum separation error occur because of the poor transfer.
 - Enter the same value as "[I.8.1.6 Transfer Offset Adjustment \(Offset Lead Edge 2\(Back\)\)](#)".
 - Change the edge1 and edge2 at the same time
- Discharge image noise (Pedatified)
 - Paper on which it tends to occur
 - Unidentified
 - Paper weight
 - 40 g/m² to 61 g/m²
 - Environment in which it tends to occur
 - Low humidity environment
 - Adjustment method
 - Adjust to the positive side
 - Adjust positively by 10steps until the proper condition can be obtained.
Setting Range
: - 128 to + 127
 - Precaution related to other adjustments
 - When the steps are moved too much in plus direction, the transfer repelling or belt separation error is possible to occur.
 - Enter the same value as "[I.8.1.6 Transfer Offset Adjustment \(Offset Lead Edge 2\(Back\)\)](#)".

8.1.5 Transfer Offset Adjustment (Offset Lead Edge 2(Front))

(1) Measure taken according to cause

- Drum separation error
 - Paper on which it tends to occur
 - Unidentified
 - Paper weight
 - 40 g/m² to 91 g/m²
 - Environment in which it tends to occur
 - High to normal humidity condition
 - Adjustment method
 - Adjust to the positive side
 - Adjust positively by 10steps until the proper condition can be obtained.
Setting Range
: - 128 to + 127
 - Precaution related to other adjustments
 - When the steps are moved too much in plus direction, the transfer repelling or belt separation error is possible to occur.
 - Enter the same value as "[I.8.1.3 Transfer Offset Adjustment \(Offset Lead Edge 1\(Front\)\)](#)".
 - Change the edge1 and edge2 at the same time
- Belt separation error
 - Paper on which it tends to occur
 - Unidentified
 - Paper weight

- 40 g/m² to 61 g/m²
- 3. Environment in which it tends to occur
 - Unidentified
- 4. Adjustment method
 1. Adjust to the negative side
 2. Adjust negatively by 10steps until the proper condition can be obtained.
Setting Range
: - 128 to + 127
 3. Change the edge1 and edge2 at the same time
- 5. Precaution related to other adjustments
 - When the steps are moved too much in minus direction, it is possible that the density decrease or the drum separation error occur because of the poor transfer.
 - Enter the same value as "[I.8.1.3 Transfer Offset Adjustment \(Offset Lead Edge 1\(Front\)\)](#)".
- 3. Discharge image noise (Pedatifid)
 1. Paper on which it tends to occur
 - Unidentified
 2. Paper weight
 - 40 g/m² to 61 g/m²
 3. Environment in which it tends to occur
 - Low humidity environment
 4. Adjustment method
 1. Adjust to the positive side
 2. Adjust positively by 10steps until the proper condition can be obtained.
Setting Range
: - 128 to + 127
 5. Precaution related to other adjustments
 - When the steps are moved too much in plus direction, the transfer repelling or belt separation error is possible to occur.
 - Enter the same value as "[I.8.1.3 Transfer Offset Adjustment \(Offset Lead Edge 1\(Front\)\)](#)".

8.1.6 Transfer Offset Adjustment (Offset Lead Edge 2(Back))

(1) Measure taken according to cause

1. Drum separation error
 1. Paper on which it tends to occur
 - Unidentified
 2. Paper weight
 - 40 g/m² to 91 g/m²
 3. Environment in which it tends to occur
 - High to normal humidity condition
 4. Adjustment method
 1. Adjust to the positive side
 2. Adjust positively by 10steps until the proper condition can be obtained.
Setting Range
: - 128 to + 127
 3. Change the edge1 and edge2 at the same time
 5. Precaution related to other adjustments
 - When the steps are moved too much in plus direction, the transfer repelling or belt separation error is possible to occur.
 - Enter the same value as "[I.8.1.4 Transfer Offset Adjustment \(Offset Lead Edge 1\(Back\)\)](#)".
2. Belt separation error
 1. Paper on which it tends to occur
 - Unidentified
 2. Paper weight
 - 40 g/m² to 61 g/m²
 3. Environment in which it tends to occur
 - Unidentified
 4. Adjustment method
 1. Adjust to the negative side
 2. Adjust negatively by 10steps until the proper condition can be obtained.
Setting Range
: - 128 to + 127
 3. Change the edge1 and edge2 at the same time
 5. Precaution related to other adjustments
 - When the steps are moved too much in minus direction, it is possible that the density decrease or the drum separation error occur because of the poor transfer.
 - Enter the same value as "[I.8.1.4 Transfer Offset Adjustment \(Offset Lead Edge 1\(Back\)\)](#)".
3. Discharge image noise (Pedatifid)
 1. Paper on which it tends to occur
 - Unidentified
 2. Paper weight
 - 40 g/m² to 61 g/m²
 3. Environment in which it tends to occur
 - Low humidity environment
 4. Adjustment method
 1. Adjust to the positive side
 2. Adjust positively by 10steps until the proper condition can be obtained.
Setting Range

: - 128 to + 127

5. Precaution related to other adjustments

- When the steps are moved too much in plus direction, the transfer repelling or belt separation error is possible to occur.
- Enter the same value as "I.8.1.4 Transfer Offset Adjustment (Offset Lead Edge 1(Back))".

8.1.7 Transfer Offset Adjustment (Offset Lead Edge 3(Front))

Usually, do not use this adjustment in the field.

8.1.8 Transfer Offset Adjustment (Offset Lead Edge 3(Back))

Usually, do not use this adjustment in the field.

8.1.9 Transfer Offset Adjustment (Offset Center(Front))

(1) Measure taken according to cause

1. poor transfer

1. Paper on which it tends to occur

- Unidentified

2. Paper weight

- Unidentified

3. Environment in which it tends to occur

- Unidentified

4. Adjustment method

1. Adjust to the positive side

2. Adjust positively by 10steps until the proper condition can be obtained.

Setting Range

: - 128 to + 127

5. Precaution related to other adjustments

- When the steps are moved too much in plus direction, the transfer repelling is possible to occur.

2. Discharge image noise (Pedatified)

1. Paper on which it tends to occur

- Fine, Plain

2. Paper weight

- Thin paper

3. Environment in which it tends to occur

- Unidentified

4. Adjustment method

1. Adjust to the positive side

2. Adjust positively by 10steps until the proper condition can be obtained.

Setting Range

: - 128 to + 127

5. Precaution related to other adjustments

- When the steps are moved too much in plus direction, the transfer repelling is possible to occur.

3. Transfer repelling

1. Paper on which it tends to occur

- Unidentified

2. Paper weight

- Thick

3. Environment in which it tends to occur

- Low humidity environment

4. Adjustment method

1. Adjust to the negative side

2. Adjust negatively by 10steps until the proper condition can be obtained.

Setting Range

: - 128 to + 127

5. Precaution related to other adjustments

- When the steps are moved too much in minus direction, it is possible that the density decrease or the discharge image noise (pedatified) occur because of the poor transfer.

8.1.10 Transfer Offset Adjustment (Offset Center(Back))

(1) Measure taken according to cause

1. poor transfer

1. Paper on which it tends to occur

- Unidentified

2. Paper weight

- Unidentified

3. Environment in which it tends to occur

- Unidentified

4. Adjustment method

1. Adjust to the positive side

2. Adjust positively by 10steps until the proper condition can be obtained.

Setting Range

: - 128 to + 127

5. Precaution related to other adjustments

- When the steps are moved too much in plus direction, the transfer repelling is possible to occur.

2. Discharge image noise (Pedatified)

1. Paper on which it tends to occur

- Fine, Plain
- 2. Paper weight
 - Thin paper
- 3. Environment in which it tends to occur
 - Unidentified
- 4. Adjustment method
 1. Adjust to the positive side
 2. Adjust positively by 10steps until the proper condition can be obtained.
 Setting Range
 : - 128 to + 127
- 5. Precaution related to other adjustments
 - When the steps are moved too much in plus direction, the transfer repelling is possible to occur.
- 3. Transfer repelling
 1. Paper on which it tends to occur
 - Unidentified
 2. Paper weight
 - Thick
 3. Environment in which it tends to occur
 - Low humidity environment
 4. Adjustment method
 1. Adjust to the negative side
 2. Adjust negatively by 10steps until the proper condition can be obtained.
 Setting Range
 : - 128 to + 127
 5. Precaution related to other adjustments
 - When the steps are moved too much in minus direction, it is possible that the density decrease or the discharge image noise (pedatified) occur because of the poor transfer.

8.1.11 Transfer Offset Adjustment (Offset Rear Edge(Front))

(1) Measure taken according to cause

1. poor transfer
 1. Paper on which it tends to occur
 - Unidentified
 2. Paper weight
 - Unidentified
 3. Environment in which it tends to occur
 - Unidentified
 4. Adjustment method
 1. Adjust to the positive side
 2. Adjust positively by 10steps until the proper condition can be obtained.
 Setting Range
 : - 128 to + 127
 5. Precaution related to other adjustments
 - When the steps are moved too much in plus direction, the transfer repelling is possible to occur.
2. Discharge image noise (Pedatified)
 1. Paper on which it tends to occur
 - Fine, Plain
 2. Paper weight
 - Thin paper
 3. Environment in which it tends to occur
 - Unidentified
 4. Adjustment method
 1. Adjust to the positive side
 2. Adjust positively by 10steps until the proper condition can be obtained.
 Setting Range
 : - 128 to + 127
 5. Precaution related to other adjustments
 - When the steps are moved too much in plus direction, the transfer repelling is possible to occur.
3. Transfer repelling
 1. Paper on which it tends to occur
 - Unidentified
 2. Paper weight
 - Thick
 3. Environment in which it tends to occur
 - Low humidity environment
 4. Adjustment method
 1. Adjust to the negative side
 2. Adjust negatively by 10steps until the proper condition can be obtained.
 Setting Range
 : - 128 to + 127
 5. Precaution related to other adjustments
 - When the steps are moved too much in minus direction, it is possible that the density decrease or the discharge image noise (pedatified) occur because of the poor transfer.

8.1.12 Transfer Offset Adjustment (Offset Rear Edge(Back))

(1) Measure taken according to cause

1. poor transfer
 1. Paper on which it tends to occur
 - Unidentified
 2. Paper weight
 - Unidentified
 3. Environment in which it tends to occur
 - Unidentified
 4. Adjustment method
 1. Adjust to the positive side
 2. Adjust positively by 10steps until the proper condition can be obtained.
 Setting Range
: - 128 to + 127
 5. Precaution related to other adjustments
 - When the steps are moved too much in plus direction, the transfer repelling is possible to occur.
2. Discharge image noise (Pedatified)
 1. Paper on which it tends to occur
 - Fine, Plain
 2. Paper weight
 - Thin paper
 3. Environment in which it tends to occur
 - Unidentified
 4. Adjustment method
 1. Adjust to the positive side
 2. Adjust positively by 10steps until the proper condition can be obtained.
 Setting Range
: - 128 to + 127
 5. Precaution related to other adjustments
 - When the steps are moved too much in plus direction, the transfer repelling is possible to occur.
3. Transfer repelling
 1. Paper on which it tends to occur
 - Unidentified
 2. Paper weight
 - Thick
 3. Environment in which it tends to occur
 - Low humidity environment
 4. Adjustment method
 1. Adjust to the negative side
 2. Adjust negatively by 10steps until the proper condition can be obtained.
 Setting Range
: - 128 to + 127
 5. Precaution related to other adjustments
 - When the steps are moved too much in minus direction, it is possible that the density decrease or the discharge image noise (pedatified) occur because of the poor transfer.

8.1.13 Fusing pressure setting (1250/1250P/1052 only)

(1) Measure taken according to cause

1. Insufficient fusing
 1. Paper on which it tends to occur
 - Fine, Plain
 2. Paper weight
 - Thin to plain paper
 3. Environment in which it tends to occur
 - Low to normal temperature
 4. Adjustment method
 1. Refer to "I.8.2.14 User setting of each paper brand" to check the pressure level.
 2. Raise the pressure level one by one to be higher than the level confirmed in the step 1, and make it appropriate for improving the symptom.
 Setting Range
: The pressure gets stronger by setting to [Very Weak Pressure] → [Weak Pressure] → [Medium Pressure] → [Strong Pressure] in order.
 5. Precaution related to other adjustments
 - It is possible that too excessive adjustment makes the paper more curled.
2. Excessive curling
 1. Paper on which it tends to occur
 - Fine, Plain
 2. Paper weight
 - Thin paper
 3. Environment in which it tends to occur
 - Normal to high humidity condition
 4. Adjustment method
 1. Refer to "I.8.2.14 User setting of each paper brand" to check the pressure level.
 2. Lower the pressure level one by one to be higher than the level confirmed in the step 1, and make it appropriate for improving the symptom.
 Setting Range

: The pressure gets weaker by setting to [Weak Pressure] → [Medium Pressure] → [Strong Pressure] → [Very Weak Pressure] in order.

5. Precaution related to other adjustments

- It is possible that too much adjustment makes the fusing insufficient.

8.1.14 Process line speed setting

(1) Measure taken according to cause

1. NCR paper changes in color (1250/1250P only).

1. Paper on which it tends to occur
 - NCR paper
2. Paper weight
 - Unidentified
3. Environment in which it tends to occur
 - Unidentified
4. Adjustment method
 1. Set to [Mid Speed]

Setting Range

: [High Speed]/[Mid Speed]/[Low Speed]

* [Mid Speed] is only for 1250/1250P

The setting value of each machine is as follows.

	1250/1250P	1052	951
High Speed	570mm/s	490mm/s	460mm/s
Mid Speed	490mm/s	-	-
Low Speed	330mm/s	330mm/s	290mm/s

5. Precaution related to other adjustments

- Default speed is [Mid Speed] or [Low Speed], [High Speed] is not selectable
- Default speed is [Low Speed], [Mid Speed] is not selectable
- Change in the process speed is only applied for the following types and weights of papers.
 - Paper type: Coated, PrePrinted, Fine, Plain, Book/News, Embossed
 - Paper weight: 40 to 74g/m²

8.1.15 Density level of the Embossed2 (1250/1250P/1052 only)

(1) Measure taken according to cause

1. Transfer missing on the paper depressed part

1. Paper on which it tends to occur
 - Paper with a rough surface
2. Paper weight
 - Unidentified
3. Environment in which it tends to occur
 - Unidentified
4. Adjustment method
 1. Raise by 1 level.

Setting Range

: [Level 1]/[Level 2]/[Level 3]

* Default is [Level 3]

5. Precaution related to other adjustments

- Raising the level increases the toner consumption.

2. Dark image density

1. Paper on which it tends to occur
 - Unidentified
2. Paper weight
 - Unidentified
3. Environment in which it tends to occur
 - Unidentified
4. Adjustment method
 1. Reduce by 1 level.

Setting Range

: [Level 1]/[Level 2]/[Level 3]

* Default is [Level 3]

5. Precaution related to other adjustments

- Reducing the level leads to the easier occurrence of the transfer missing on the depressed part.

8.2 Image quality/improving paper feeding adjustment

8.2.1 OUTLINE

This section describes the methods of adjustments to improve image quality (the front and back registration, image density, transfer jitter) and paper feeding in response to customers (especially POD customers) who demand even higher quality of image and feeding than the factory settings.

8.2.2 The front and back registration

Align image printing position on the front side and back side.
Misalignment of image printing position occurs for the following reasons.

- The image leading edge on the front and back side are different. Thus, in case leading edge timings are misaligned, image positions on the front and back side are misaligned.
- Even the standard-size papers are not cut off according to the standard size.
- A paper that passes the fusing section becomes smaller because of moisture evaporation of the paper due to heat. In duplex printing, the front side passes the fusing section twice and the back side passes once, thus image on the front side becomes smaller than the back side.
- The shrinkage ratio in passing the fusing section is different depending on the paper type, paper brand, temperature/humidity of a paper storage location. To adjust misalignment due to these factors, use the front and back adjustment in the user mode, selecting [MACHINE] - [Register Type/Weight]. To adjust misalignment due to individual difference of each tray, select the tray you want to adjust in the user mode, selecting [MACHINE] - [Tray Setting]. Then, select [Change Set] - [Both Sides Adj.] in the [Change individualSet] to make an adjustment.

8.2.3 The front and back registration (printer) (front and back registration)

(1) Procedure

1. Adjust the paper skew on both side.
With the registration roller paper skew adjustment in the mechanical adjustment, adjust the skew of the sub scan direction on both side to be parallel to each other.

1050fs3350c

[1] Front	[2] Back
-----------	----------

2. Use the service mode to adjust various image timing in the front side of printer system.
Note
 - With the [Printer Centering Adjustment] in the service mode, there is no adjustment for individual tray. In case you must adjust individual tray, select the user mode, selecting [MACHINE] - [Tray Setting]. Then, select [Change Set] - [Both Sides Adj.] in the [Change individualSet] to make adjustment with the Image Shift function.
3. Adjust the leading edge timing of the back side.
Use [Printer Restart Timing Adjustment(Side2)] in the service mode. Use the cross on the figure A to align the leading edge timing of the back side to the timing of the front side.

1050fs3043c

[1] Front	[2] Back
-----------	----------

4. Align the magnification of the back side to the front side.
Use [Printer FD-Mag. Adjustment (Side2)] and [Printer CD-Mag. Adjustment (Side2)] to align magnification of the back side to the front side.

5. Adjust the centering of the back side.
At the user mode, select the tray you want to adjust from [MACHINE] - [Tray Setting]. Then, select [Change Set] - [Both Sides Adj.] in the [Change individualSet] to make adjustment. Use the Image Shift function to align the centering of the back side on the figure A to the front side.
- Note
- With the [Printer Centering Adjustment] in the service mode, there is no adjustment for individual tray.
 - Since a test pattern cannot be output in the user mode, output an image from a PC to confirm the image centering or use [Test Pattern Output Mode] in Service mode.
 - The [Tray Setting] you set in step4 is an individual adjustment, in which the updated settings are not applied to the registered paper type. Thus, to change the registered paper type, select the paper name key you want to adjust in [MACHINE] - [Paper Setting Reg./Del.]. Make the adjustment with the Image Shift function of [Both Sides Adj.].

8.2.4 The front and back registration (scanner) (front and back registration)

- Note
- Be sure that the following adjustments are done.
"I.5.3.11 Scanner FD-Mag. Adj. (Magnification Adjustment)"
"I.5.3.35 Distortion Adjustment"
 - This adjustment is for 1250/1052/951 (copier version). 1250P (printer version) does not have the adjustment method.

(1) Procedure

1. Align the leading edge timing of both sides.
Use [Scanner Restart Timing Adjustment] in the service mode. Use the cross on the figure A to align the leading edge timing of both sides.

2. Align the centering and the magnification of both sides.
Use Image Shift in the [Both Sides Adj.] to align the centering of both sides on the figure A.

[1] Front	[2] Back
-----------	----------

3. Adjust the original skew.
Remove the original stopper plate /Rr, and mark the current position of the adjustment plate [1] with something like a pencil. Loosen the screw [2] to move the adjustment plate [1] up and down, thus adjusting the mounting position of the original stopper plate /Rr.

— [1]
--- [2]

1050fs3048c

[1] Front	[2] Back
-----------	----------

4. Perform steps 1 and 2 to adjust the misalignments of timing and centering caused by the original skew adjustment and the magnification adjustment.

8.2.5 The front and back registration (ADF) (front and back registration)

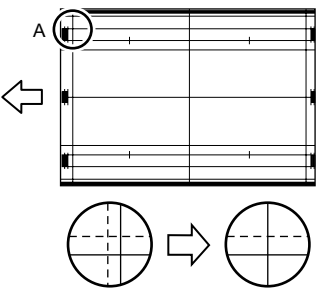

Note

- Be sure that the following adjustments are done.
"I.5.3.11 Scanner FD-Mag. Adj. (Magnification Adjustment)"
"I.5.3.20 ADF Restart Timing Adj. (Timing Adjustment)"
"I.5.3.24 ADF Centering Adjustment (Centering Adjustment)"

- "I.5.3.35 Distortion Adjustment"
- This adjustment is for 1250/1052/951 (copier version). 1250P (printer version) does not have the adjustment method.

(1) Procedure

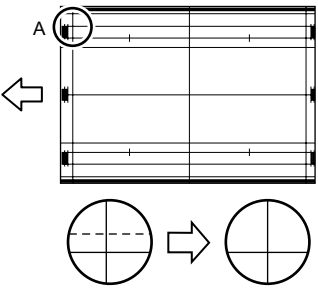

1. Align the leading edge timing of both sides.
Use [ADF Restart Timing Adj.] in the service mode. Use the cross on the figure A to align the leading edge timing of the back side to the front side.

[1]Front

[2]Back

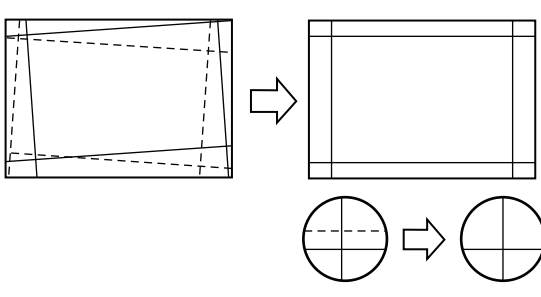

2. Align the centering of both sides.
Use [ADF Centering Adjustment] in the service mode to align the centering of the back side on the figure A to the front side.

[1]Front

[2]Back

3. Adjust the ADF paper skew.
With the ADF paper skew adjustment in the mechanical adjustment, adjust the skew on the front and back side.

[1]Front

[2]Back

4. Perform steps 1 and 2 to adjust the misalignments of timing and centering caused by the ADF paper skew adjustment.

8.2.6 The front and back registration by user (by paper brand) (front and back registration)

I.8.2.3 The front and back registration (printer) (front and back registration) I.8.2.4 The front and back registration (scanner) (front and back registration) I.8.2.5 The front and back registration (ADF) (front and back registration)Even when conducting the front and back registration in to, an adjustment is required depending on the type and brand of paper to be used.

Note

- I.8.2.3 The front and back registration (printer) (front and back registration) I.8.2.4 The front and back registration (scanner) (front and back registration) I.8.2.5 The front and back registration (ADF) (front and back registration)Check to see if the front and back registrations in to are completed.

(1) Procedure

1. From "MACHINE" in the user mode, press [Custom Register/Delete].

- Press the name key of paper you want to change, or press [↵] key to select the registered paper.

- Press [Add / Edit] to input the paper type, paper name, weight, colored paper and punch. For the type of paper and the weight, refer to "1.8.2.14 User setting of each paper brand".

- Press [Both Sides Adj.], and adjust the front and back registration.

8.2.7 The front and back registration by user (Fine Adjustment) (front and back registration)

1.8.2.6 The front and back registration by user (by paper brand) (front and back registration) Even when conducting the adjustments for brand of paper as described in, an adjustment is required depending on the number of trays in which paper is fed, the storage condition (temperature and humidity) of paper and the temperature and humidity in the room, and so on.

This adjustment describes the method for fine adjustment of each tray to the front and back adjustment of the paper brand setting described in **1.8.2.6 The front and back registration by user (by paper brand) (front and back registration)**

Note

- Check to see if the front and back registrations in **1.8.2.3 The front and back registration (printer) (front and back registration)**, **1.8.2.4 The front and back registration (scanner) (front and back registration)**, **1.8.2.5 The front and back registration (ADF) (front and back registration)**, **1.8.2.6 The front and back registration by user (by paper brand) (front and back registration)** are completed.

(1) Procedure

- From "MACHINE" in the user mode, press [Tray Setting].

- Press the tray key you want to adjust, and then press [Change].

- Press [Both Sides Adj.].

4. Register the front and back of the paper.
There are 2 modes for the registration, automatic (adjustment) and manual (adjustment).
 - Manual registration (adjustment)

- Automatic registration (adjustment)
Press [Chart Adjustment] to execute the automatic registration (adjustment).

5. When adjusting another tray, repeat the steps 2 to 4.

8.2.8 Darken image density (image density adjustment)

Print industry customers sometimes demand image settings with dark image density in the shadow area such as the offset printing. This section describes how to adjust the shadow area (max. density) to make its image density darker.

If the adjustment to make image density darker is not performed properly, toner spillage or image background occurs. By this procedure, the density can be adjusted more safely, minimizing occurrences of these problems. However, perform this adjustment only when necessary. Related adjustments are as follows.

- Setting menu mode
 1. Image Density Selection
This setting changes the charger voltage and the developing bias.

- Service mode
 1. DIPSW5-5/6/7 developer toner density switchover
This setting adds the adjustment to the output value of TCR sensor, thus changing the toner density of developer without changing image density which changes the toner density.
 2. [Default Density Setting] on [Process Adjustment]
This setting makes fine adjustment of standard density in the printer engine.

(1) Procedure

1. With the image density selection of the density setting in the setting menu mode, set Darker [+1].
2. Output the test pattern No.11 in the test pattern output mode.
3. Confirm image density.
4. When image density is insufficient, conduct [Default Density Setting] on [Process adjustment]. (Refer to [I.5.4.17 Default Density Setting \(Drum Peculiarity Adjustment\)](#))
5. Confirm image density.
6. Check the value of [MAX DENSITY MANUAL ADJUSTMENT] (developing theta) and set it "+0.4%" with DIPSW5-5/6/7 developer toner density switch when the value is about 250.
7. Output 500 prints of the test pattern No.11.
8. Check the image density and adjust it to the plus side 1 step by step with DIPSW5-5/6/7 developer toner density switch until an appropriate value is obtained.

Note

- Be sure to adjust it 1 step by step since this setting change the toner density directly.
- Be sure not to adjust it too much by checking toner spillage or image background after changing the setting.

8.2.9 Lighten image density (image density adjustment)

Such printing materials as books use lighter letters to reduce eyestrain of readers. Thus, some print industry customers demand light image settings.

This section describes how to lighten image density of the shadow section (max. density) without changing image density of the highlight section.

If the adjustment to make image density lighter is not performed properly, white spots in the shadow section occur. By this procedure, the density can be adjusted more safely, minimizing occurrences of problems. However, perform this adjustment only when necessary.

Related adjustments are as follows.

- Setting menu mode
 1. Image Density Selection
This setting changes the charger voltage and the developing bias.

- Service mode
 1. [Default Density Setting] on [Process Adjustment]
This setting makes fine adjustment of standard density in the printer engine.

(1) Procedure

1. With the image density selection of the density setting in the setting menu mode, set Lighter [-1].
2. Output the test pattern No.11 in the test pattern output mode.
3. Confirm image density.
4. When image density is insufficient, repeat steps 1 and 2 until "-5."
5. When image density is insufficient, conduct [Default Density Setting] on [Process adjustment]. (Refer to [I.5.4.17 Default Density Setting \(Drum Peculiarity Adjustment\)](#))
6. Output the test pattern No.11 in the test pattern output mode to confirm image density.

8.2.10 Transfer jitter adjustment

Describes how to adjust transfer jitter.

(1) Preparation

Adjustments differ depending on the position at which transfer jitter occurs. Thus, locate the position where transfer jitter occurs. Measure with a scale.

(a) Procedure

1. Output No.9 of the "test pattern output mode" with A3 paper.

Note

- Select [Test pattern density setting] of the service mode, and check to ensure that the test pattern density is set to 255.

2. Confirm the position where transfer jitter occurs.

[1]	Approx. 124mm from the leading edge	[4]	Approx. 265mm from the trailing edge
[2]	Approx. 120mm from the trailing edge	[5]	Approx. 150mm from the leading edge of the 2nd sheet
[3]	Approx. 160mm from the trailing edge	[6]	Random occurrence

Note

- The position where transfer jitter occurs differs depending on the paper type, paper weight or paper conveyance behavior.

(2) Cause and tendency of occurrence

The following shows the cause and tendency of occurrence for each transfer jitter occurrence position.

- [1] Approx. 124mm from the leading edge
Transferring the shock which caused when paper enters the transfer/separation section to LPH is the cause.
It occurs on the 300g/m² or more paper and appears sharply.
- [2] Approx. 120mm from the trailing edge (300mm from the leading edge)
Transfer jitter which occurs when the paper enters the fusing section. It occurs when the transfer belt speed is slower than the fusing.
- [3] Approx. 160mm from the trailing edge
The speed change which caused when the trailing edge passes through the nip of the registration roller is the cause.
- [4] Approx. 265mm from the trailing edge
The speed change which caused when the trailing edge passes through the loop roller is the cause.
- [5] Approx. 150mm from the trailing edge of the 2nd sheet
It occurs when the transfer belt speed changes when the 1st sheet enters the fusing section and separate from the transfer belt.
- [6] Random occurrence
The writing jitter which occurs when the transfer jitter due to the speed difference between the transfer belt and the fusing occurs and that condition causes the drum speed change.

(3) Measure taken

The following shows the measures to take for each transfer jitter occurrence position.

Transfer jitter occurrence position No.	Priority for adjustment		
	Transfer Belt Speed Adj. (Refer to 1.5.3.3 Transfer Belt Speed Adj. (Magnification Adjustment))	Regist line speed adjustment (Refer to 1.5.3.6 Registration Line Speed Adj. (Magnification Adjustment))	Fusing Speed Adjustment (Refer to 1.5.3.4 Fusing Speed Adjustment (Magnification Adjustment))
[1]	-	(1) Adjust to negative side	-
[2]	(2) Conduct this adjustment when the trouble is not resolved only with Fusing Speed Adjustment	((3)) When adjusting Transfer Belt Speed Adj., be sure to check	(1) Adjust to the negative side.
[3]	-	(1) Adjust either positive or negative side	-
[4]	-	(1) Adjust either positive or negative side	-
[5]	(2) Conduct this adjustment when the trouble is not resolved only with Fusing Speed Adjustment	((3)) When adjusting Transfer Belt Speed Adj., be sure to check	(1) Adjust to the negative side.
[6]	(2) Conduct this adjustment when the trouble is not resolved only with Fusing Speed Adjustment	((3)) When adjusting Transfer Belt Speed Adj., be sure to check	(1) Adjust to the negative side.

8.2.11 Overlay printing adjustment

Overlay printing is to reprint the company name, the address, the logo, and so on, on offset printed paper.

When performing overlay printing, take notice the following description.

Reference:

- The surface of coated paper is applied with a coating agent and so it takes more time for the ink of offset printing to dry. Therefore, to prevent blocking (back transfer), the entire surface of paper is applied with powder. The powder drastically reduces the conveyance forces of the pick-up roller and the paper feed roller, and this instance is apt to cause a no feed jam or a double feed jam.

Note

- Before overlay printing, be sure to take note of following.
 - In the case of PF-706, be sure to install the PP-701 (urethane roller).
 - We recommend use of PF-703 for the overlay printing.
 - Apply as little powder as possible when offset printing.
 - Get paper loosened sufficiently before setting it in the tray.
 - Adjust paper condition with the same environments (temperature and humidity) as the environments for the main body. When left in a high humidity environment, paper strongly adheres to each other making them unable to feed.
- A paper centering error is likely to occur due to contamination of the centering sensor (PS4) with powder. Clean the sensor if the error occurs or before starting overlay printing.
- Registration of paper must be checked every 30,000 prints.

(1) Preparation

- Conduct the following settings to the tray in the user mode.

- Set paper on which overlay printing has been made.
- Set the type of paper to [PrePrinted].
- Set the air-blow setting to [ON].

Note

- Registration of back and front sides must be checked every day before starting printing.

- Make the following settings in the service mode.

- Set software DIPSW26-4 to 1. (Sets forced separation clutch control ON at all times.)
- Set the DIPSW2-4/5 to "1". (sets the cleaning cycle of the charging corona to every 5,000 prints)
- When using paper other than coated paper for overlay printing, make the paper type setting to other than preprinted paper and set the software DIPSW corresponds to the selected paper tray to "1".

Tray1: DIPSW39-0

Tray2: DIPSW39-1

Tray3: DIPSW39-2

Tray4: DIPSW39-3

Tray5: DIPSW39-4

Tray6: DIPSW39-5

Tray7: DIPSW39-6

Tray8: DIPSW39-7

Note

- By setting above mentioned DIPSW to "1", paper feed control turns to be the same as that of [Preprinted paper] to keep the endurance of the urethane roller. However, it tends to cause the double feed.
- The above mentioned DIPSW does not work when [Coated paper] or [Paper weight 92g/m²] or more is selected for the paper setting.

3. Install the paper feed assist plate. (Refer to [1.9.3 Pick-up roller load adjustment](#))

Note

- The number of paper feed assist plates varies according to the paper weight.
 130g/m² or less → None
 130g/m² or more → 4 pcs.

(2) Air assist adjustment

Check to see if the height of the air supply opening of the paper feed assist fan and the upper surface of paper are appropriate. Otherwise air assist is not conducted properly and a jam occurs.

(a) Procedure

1. Pull out the tray and set about 10 sheets of coated paper that have been printed in offset.
2. Push in the release lever [1], insert the screw [2] into the hole [3] to fix the release lever, and then set the tray.

3. After stop sound of the paper lift motor operation (when the paper lift plate gets to the upper limit position), pull out tray again.
4. Check the measurement "a" between the center position [1] (The center is 4.5mm from the upper edge [2].) of the air supply openings of the paper feed assist fan /Fr and /Rr and the upper surface of paper [3].
 Standard value "a": within 4.5 ± 2.5mm
 When the value is not within the standard, conduct step7 and succeeding steps.

5. Release the release lever that was fixed at step2 and bring down the paper lift plate.
6. Pull out the tray and load it fully with coated paper that has been printed, and perform steps 2 to 5.
7. Conduct the following adjustments according to the curling condition of paper.
 1. When there is no paper curling with no paper slant.
Conduct "Pick-up roller height adjustment." (Refer to [I.9.4 Pick-up roller height adjustment](#))
 2. If there is slant found due to paper curling:

Put the underlays (included in the PP package) [1] under the lower side of the stacked paper.

Note

- To prevent air from blowing upon the pad when the remaining paper gets low, place the pad to the right side of the air supply opening position [2].

3. When there is a convex curling found with paper:

1050fs3062c

Put the underlays (included in the PP package) [1] under both sides of the stacked paper.

Note

- To prevent air from blowing upon the pad when the remaining paper gets low, place the pad to the right side of the air supply opening position [2].

1050fs3352c

4. When there is a concave curling found with paper:

1050fs3064c

Put the underlays (included in the PP package) [1] under the center part of the stacked paper.

Note

- To prevent air from blowing upon the pad when the remaining paper gets low, place the pad to the right side of the air supply opening position [2].
If there is a concave curling, it is normally possible to adjust curling by placing a pad at the center position 40mm away from the front and rear paper guides.

1050fs3353c

8. After adjustment, repeat step1 to step6 to check again the paper height at the air supply opening section.
9. Remove the PF right cover.
(PF-706: refer to [G.5.2.2 Right cover](#)), (PF-703: refer to [G.4.2.2 Right cover](#))
10. Select the code of the tray adjusted with code 42-** of the service mode - I/O check and press the start button to operate the paper feed assist fan.
11. After checking the paper separation condition [1] from the right side of the PF, press the Stop button to complete the I/O check.

12. Conduct the respective operations depending on the condition of separation.
 - a. Air is blown upon more than 10 sheets of paper and separate a sheet each.
 - b. Paper separation is not made for 1 sheet each, but 10 or more sheets of paper are being floated by air.
 - c. The number of sheets of paper that are being floated by air is less than 4 or 5.
 - d. No paper is floated

In the cases of "a" and "b," conduct step12 and succeeding steps.

In the cases of "c" and "d," repeat step1 to step11.

13. Conduct a test print to check to see if a jam occurs.
When a jam occurs, conduct "C. Paper feed pressure adjustment."
14. Reinstall the above parts following the removal steps in reverse.

Note

- Be sure to release the release lever that has been fixed at the step2.

(3) Paper feed pressure adjustment

Despite the paper separation being made correctly by air from the paper feed assist fan, when a paper jam occurs, conduct the following adjustments.

(a) Procedure

1. Conduct the respective operations depending on the condition of jam.
 - J14-01 (Paper is not conveyed to the separation roller due to slipping of pick-up roller.) Add paper feed assist plates to raise pressure on the pick-up roller. (Refer to [I.9.3 Pick-up roller load adjustment](#))

Note

- 4 sheets of paper feed assist plate are normally used. However, when a no feed condition recurs, it is possible to use up to 8 sheets.
- J14-01 (paper bumps against both sides [2] of the entrance guide plate [1] and cannot go over the entrance guide plate [1].) Put the underlays (included in the PP package) [3] on the bottom of the tray locating them directory underneath [4] both edges [2] of the entrance guide plate [1].
- Be sure to set the underlays [3] so that those top edges are not contacted with the surface [5] of the tray, otherwise they interfere with the paper lift plate operation.
- Put the underlays [3] avoiding the paper empty sensor [6].

- J14-01 with thick paper (Paper is not conveyed to the separation roller due to paper being unable to get over the entrance guide plate.)
Up the pick-up roller height. (Down the sensor position. 2mm as a tentative) (Refer to [I.9.4 Pick-up roller height adjustment](#))
- J14-01 (Jam with a crushed leading edge of paper)
Increase the separation pressure. (Refer to [I.9.2 Separation pressure adjustment](#))
- J14-02 (No feed occurs before the pre-registration roller.)
Increase the separation pressure. (Refer to [I.9.2 Separation pressure adjustment](#))
- J17-12 (Double feed)
Down the pick-up roller height. (Down the sensor position. 2mm as a tentative) (Refer to [I.9.4 Pick-up roller height adjustment](#))

8.2.12 PF-703 air-blow adjustment

When the paper feed jam occurs from PF-703 tray according to the type of paper or the weight, set "Air Assist" in "Tray setting" to "On" to prevent the paper feed jam by adjusting the air volume of the lead air and the side air.

⚠ Note:

- Since the machine operates without the paper feed check window in this adjustment, be sure not to put your hand there.

(1) Prerequisite

The following items have to be done for conducting this adjustment.

- Remove the paper feed check window of the PF-703 tray and check the paper movement.
- Check the default value of the paper type/weight of the selected tray from the air-blow setting table.

Note

- When the jam occurs, check the setting position of paper and conduct this adjustment. Be sure to check the paper setting position since the bad setting position causes the jam.

(2) Preparation:

- Remove the paper feed check window of the tray to be adjusted. (Refer to [G.4.2.11 Paper feed check window](#))

(3) Procedure

1. Remove the paper feed check window. (Refer to [G.4.2.11 Paper feed check window](#))
2. Set [Tray Setting] and [Air Assist] on [MACHINE] tab in the user mode to [On].
3. Check the paper setting of the tray on which the jam occurs and [D. Air-blow setting table by paper type] to set the air volume of <EDGE> and <SIDE>.

Note

- When [Air Assist] is set to [On], level [5] appears regardless of the weight/paper type.

- Level [5] is not the air volume which corresponds to the paper/weight set to the tray to be adjusted.
- For Envelope, the set value changes depending on the width of the envelope. The weight does not matter.

4. Print out with paper on which the jam occurs to check the paper movement from the front of the tray.

Note

- To check the paper movement inside the tray, use the light.

5. Refer to "E. Adjustment method by paper movement" to adjust the air-blow level of <EDGE> and <SIDE>.

(4) Air-blow setting table by paper type

(a) Paper length: less than 160mm

Type of paper	Air-blow setting	Paper weight (g/m ²)									
		40 to 49	50 to 61	62 to 74	75 to 91	92 to 135	136 to 162	163 to 216	217 to 244	245 to 300	301 to 350
Coat	Edge	6	6	4	7	9	9	9	9	9	9
	Side	0	0	4	4	4	7	9	9	9	9
PrePrinted	Edge	6	6	4	4	7	9	9	9	9	9

	Side	0	0	0	2	2	7	7			

(g) For Envelope (1250/1250P/1052+EF-102)

Length of Envelope	Air-blow setting	Width of Envelope		
		138mm or less	138mm to 200mm	201mm or more
Less than 160mm	Edge	0	1	9
	Side	0	7	4
160mm to 182mm	Edge	0	1	9
	Side	0	7	4
182mm to 297mm	Edge	0	1	9
	Side	0	7	4
297mm or more	Edge	0	1	9
	Side	0	7	4
Less than 160mm	Edge	4	0	0
	Side	2	0	0
160mm or more	Edge	4	0	0
	Side	2	0	0

(5) Adjustment method by paper movement**Case1****(1) Paper movement**

- Since the lead air is too strong, paper after 2nd sheet moves back to the opposite side of the paper feed direction and crosses over the trailing edge guide.
- Paper after the 2nd sheet gets into the gap between the stacked paper and the trailing edge guide.

(2) Jam condition

- Double feed

(3) Paper on which jam tends to occur

- Paper weight 100g/m² or less
- Paper length 210mm or longer
- Convexly curled paper

(4) Air-blow adjustment

- Weaken the lead

(5) Measure of adjustment

- Stabilize the paper movement at the paper separation point

(6) Related jam code

- Multi feed detection
J-1712
- PF703 - 1st tandem
J-1304/J-1403/J-1504
- PF703 - 2nd tandem
J-1614/J-1623/J-1634
- PI-PFU Multi feed detection
J-8107
- PI-PFU
J-8114/J-8123/J-8134

Case2**(1) Paper movement**

- Since the side air is too strong, the paper movement around the paper feed belt gets unstable.
- Paper after the second sheet floats too much to the paper feed belt side.
- Paper after the second sheet is sent a little to the paper feed direction.

(2) Jam condition

- Double feed

(3) Paper on which jam tends to occur

- Paper length 210mm or shorter

(4) Air-blow adjustment

- Strengthen the edge
- Weaken the side

(5) Measure of adjustment

- Stabilize the paper movement around the paper feed belt
- Adjust it not to float in bundle.
- Adjust it so that paper after the second sheet is not sent to the paper feed direction. (Increase the separation pressure)

(6) Related jam code

- Multi feed detection
J-1712
- PF703 - 1st tandem
J-1304/J-1403/J-1504

- PI-PFU Multi feed detection
J-8107
- PI-PFU
J-8114/J-8123/J-8134

Case3**(1) Paper movement**

- Paper gets late to float and the separation with the lead air is not enough.
- Time for separating is not enough and 2 sheets are sent right after the floating.

(2) Jam condition

- Double feed

(3) Paper on which jam tends to occur

- Paper weight 200g/m² or less

(4) Air-blow adjustment

- Strengthen the side

(5) Measure of adjustment

- Keep the air volume to float paper.
- Adjust it to keep the time to separate.

(6) Related jam code

- Multi feed detection
J-1712
- PF703 - 1st tandem
J-1304/J-1403/J-1504

- PI-PFU Multi feed detection
J-8107
- PI-PFU
J-8114/J-8123/J-8134

Case4**(1) Paper movement**

- Since the side air is too weak, the timing for paper sticking to the paper feed belt gets late.

(2) Jam condition

- Not stick to the paper feed belt

(3) Paper on which jam tends to occur

- Paper weight 200g/m² or less

(4) Air-blow adjustment

- Strengthen the side

(5) Measure of adjustment

- Keep the air volume to float paper.
- Adjust it to keep the time to separate.

(6) Related jam code

- PF703 - 1st tandem

8.2.13 Fusibility adjustment

This section describes the adjustment procedure for the case when the fusibility gets short according to the environment or paper type. The following items are the reason of the shortage of the fusibility.

- Print right after the sub power switch (SW2) turns ON from being OFF for long period
- Print right after starting from the idling (initial print)
- Print right after changing the paper weight or the paper type
- Setting environment of the machine is at low temperature
- Image pattern
- Specified paper

Note

- The productivity tends to lower since the fusing initial rotation time gets longer by the adjustment to improve the fusibility.

(a) Preparation

- Check that [Tray Setting] - [Pressure Power Setting] is [Default] (1250/1250P/1052 only).
- Check that [Setting Menu] - [Copy/Printer Setting] - [Fixing Pre-rotation Set] is [Rotation On].

In case the above 2 items are set differently, be sure to check the fusibility again after setting to [Default Pressure Power] and [Rotation On].

(b) Procedure

1. Refer to "[I.8.2.14 User setting of each paper brand](#)" to check the pressure level(1250/1250P/1052 only). This level is automatically selected when [Tray Setting] - [Pressure Power Setting] is [Default].
2. Set the level 1 level stronger than the pressure level which was checked in step 1.

Note

- When the pressure level checked in step 1 is "Strong Pressure Power", conduct the adjustment from step 3 since it cannot be stronger more than that level.

3. Print out the image and check the fusibility. When the fusibility is not enough, judge steps 4 to 6 depending on the situation.
4. In the case of the initial print (100 sheets or less after print start)/print right after changing the paper weight or the paper type:
 - 1) Change to "CONDUCT IN ALL ENVIRONMENT" in DIPSW36-2 fusibility improvement control at print starting
 - 2) Set it to "Change pressure" on DIPSW 19-5 fusing pressure control at initial print (1250/1250P/1052 only).
5. When the setting of the print/machine right after turning ON the sub power switch (SW2) is under the low temperature:
 - 1) Set DIPSW 8-4/5 fusing initial rotation time to 300 seconds.
6. When the fusibility is not enough depending on the image pattern or the paper type:
 - 1) Refer to " " to set the paper weight/paper type to 1 to 2 rank higher.[I.8.2.14 User setting of each paper brand](#)
 - 2) DIPSW19-0/1/2/3 fusing temperature setting

Note

- Since this setting changes the control temperature against all paper, the too much adjustment tends to cause the trouble like paper curling or paper waving.

8.2.14 User setting of each paper brand

For the user setting method for paper which is commonly used in the POD market by paper brand, refer to "User setting of each paper brand". This document shows the optimum set values for paper brands tested by KMBT. However, it does not assure the same image quality and paper feed ability as the paper specified by KMBT. Only the basic performance under usual environment (temperature and humidity) has been tested and confirmed. Information on other brand of paper will be also provided when the test is finished, by updating the document.

Refer to

User setting of each paper brand

8.2.15 Settings for feeding carbonless paper

When using carbonless paper (thin paper), take the following measures.

Note

- When feeding carbonless paper, take the following countermeasures.
 - When printing on carbonless middle sheets on the machine tray/PF-706, 50mm width of the sheet leading edge reacts by the pressure and changes in color. If this color cannot be allowed, use middle sheets 60mm longer in main scan direction, and 20mm longer in sub scan direction to trim off the discolored portion.
 - b) Set carbonless paper in SEF position (the narrower side of paper comes to the paper feed roller side).
 - c) Set the paper so that the paper curls convexly in the conveyance section.
 - d) Allowable curl amount is less than 3mm.
- When using paper curled more than 3mm, use the overlays included in the PP-701 package to correct the curl.
- e) Only [Simplex mode] is acceptable for carbonless paper.

(a) Preparation

1. Configure the following settings in user mode.
 - Set the type of paper to [Plain].
 - Set the air-blow setting to [ON].
 - Set the output setting to [Face-down].
 - Be sure to conduct the de-curler adjustment referring to " [I.8.2.14 User setting of each paper brand](#)
2. Carry out the following mechanical adjustment.
 - Weaken the separation pressure of the paper feed section for 1 step. (Refer to [I.9.2 Separation pressure adjustment](#))

9. MECHANICAL ADJUSTMENT bizhub PRESS 1250/1250P/1052/PRO 951

9.1 Tray Centering Adjustment

(1) Usage

This adjustment is made when the centering of paper varies each paper supplied from the trays 1 and 2. The centering is automatically adjusted in the image-processing unit, and this adjustment is made only when a centering exceeding the range of auto correction (± 5 mm) occurs.

Note

- Select [Detect] from [Setting Menu] - [06 Administrator Setting] - [01 System Setting] - [06 Expert Adjustment] - [03 Mis-centering Detect JAM Set.] to stop the operation by the jam when the centering exceeding the range of auto correction occurs.
- In this case, the jam code is J-3112.

(2) Procedure

1050fs3028c

1. Select the tray to adjust, selecting [MACHINE] - [Tray Setting] and then select [OFF] from [Change Setting] - [Mis-centerDetect].
2. Perform copying/printing without automatic correction to check the centering of image.
3. Pull out the paper feed tray.
4. If any paper remaining, remove it.
5. If the paper guide [1] is at the small-size position, stretch the guide.
6. Loosen 2 screws [2].
7. Move the paper guide [1]. According to the centering you checked in step2, adjust the center position using the marking line [3].
8. Tighten 2 screws [2].
9. Insert a paper and set the tray.
10. Make a copy/print and check to see if the centering is within the standard value (± 2 mm).
11. When not up to the standard value, repeat the steps 3 to 10.
12. Select the tray to adjust, selecting [MACHINE] - [Tray Setting] and then select [ON] from [Change Setting] - [Mis-centerDetect].

9.2 Separation pressure adjustment

(1) Usage

Perform the separation pressure adjustment when the no feed (a paper is conveyed to the paper feed roller section but stops there) or the double feed occurs at the paper feed.

Note

- The no-feed or multi-feed error is most likely to occur due to paper type or operating environment. No feed tends to occur in low temperature environment, whereas high temperature environment results in a higher rate of multi-feed.
- Excess adjustment may reverse the symptom.

(2) Procedure

1. Pull out the paper feed tray.
2. Change the position of the spring adjustment lever [1].

Note

- The separation pressure is strengthened when the lever moves to the direction [2] and is weakened when the lever moves to the direction [3].
Weak: a double feed jam is improved.
Strong: a no feed jam is improved.

Reference:

- The spring load changes 10% as the spring is moved 1 step.
3. Set the tray to perform copying/printing. Check whether the no feed or the double feed occurs or not.
 4. In case either jam occurs, repeat steps 1 to 3.

9.3 Pick-up roller load adjustment

(1) Usage

In case a no feed jam occurs frequently, perform the pick-up roller load adjustment.

(2) Procedure

1. Pull out the paper feed tray.
2. In the pick-up roller assy [1], put paper feed assist plate [3] on the paper feed assist plate holder [2], and fix them with accompanying screw (M3 x 8mm) [4].
3. Set the tray.
4. Perform copying/printing to check whether the no feed or the double feed occurs or not.

Note

- The maximum number of the paper feed assist plates that can be attached is 4 plates.
For the number of plates to be attached, refer to "[I.8.2.14 User setting of each paper brand](#)".
- The paper feed assist plate is approx. 10g each.

9.4 Pick-up roller height adjustment

(1) Usage

Perform this adjustment when the following situations occurred.

- A no feed jam is not improved by the pick-up roller load adjustment
- A no feed jam in which a thick paper is stuck on the entrance guide (a metallic guide plate near the separation roller)
- A double feed jam is not improved by the separation pressure adjustment

Note

- On performing the pick-up roller height adjustment, the paper feed pick-up amount is changed. Be sure to confirm the paper feed pick-up amount in the paper feed pick-up amount adjustment. (Refer to [I.9.5 Paper feed pick-up amount adjustment](#))

(2) Procedure

1050fs3031c

1. Pull out the paper feed tray.
2. If any paper remaining, remove it.
3. Loosen a screw [1].
4. With the release lever [2] placed at its original position, hold the stopper [3] and tighten the screw [1] to fix the stopper.

[2]

1050fs3032c

5. Set the tray. Confirm that the paper lift finished its elevation to the top by hearing the sound of the paper lift motor. Pull out the tray again.
6. Pull out the tray again. Remove 2 screws [1] to remove the paper feed cover [2].

1050fs3033c

7. Check if the actuator [1] of the pick-up roller assy meets the center [3] of the upper limit sensor/1 (PS6) and /2 (PS10) [2].
8. Remove the pick-up roller section [4]. (Refer to [F.5.7.1 Removing/reinstalling the pick-up roller assembly/separation roller assembly](#))

9. Record a mark for the height of the sensor placing plate.
10. Remove 2 screws [3], and place them temporarily in the slotted hole on the upper limit sensor placing plate [1].
11. Adjust the height of the sensor placing plate [1], and fix it with the screws [3].

Note

- Place the upper limit sensor placing plate [1] horizontally.

Adjustment standard

- Lifting the upper limit sensor position lowers the height of the pick-up roller [5]. (It increases the vertical gap [7] between the paper feed roller [6] and the pick-up roller [5].)
- Lowering the position of the upper limit sensor brings up the pick-up roller [5] (resulting in the reduced vertical gap [7] of elevation between the paper feed roller [6] and the pick-up roller [5].)
- In case a no feed occurred, lower the upper limit sensor.
- In case a double feed occurred, lift the upper limit sensor.

12. Place the pick-up roller section, and replace the stopper of step 4 to the original position.

Note

- If you set the tray without placing the pick-up roller, the paper lift does not stop at the upper limit, thus damaging the tray. Be sure to place the roller.

13. Insert a paper, and set the tray.
14. Perform copying/printing to confirm that the no feed or jam do not occur. In case they are not improved, repeat steps 7 to 14.
15. Check the paper feed pick-up amount. (Refer to [1.9.5 Paper feed pick-up amount adjustment](#))
16. Reinstall the above parts following the removal steps in reverse.

Note

- After the adjustment, be sure to replace the stopper of the release lever to the original position.

9.5 Paper feed pick-up amount adjustment

(1) Usage

Perform the paper feed pick-up amount adjustment as you have done the pick-up roller height adjustment.

(2) Procedure

1. Pull out the paper feed tray.
2. If any paper remaining, remove it.
3. Loosen a screw [1].
4. With the release lever [2] placed at its original position, hold the stopper [3] and tighten the screw [1] to fix the stopper.

1050fs3036c

1050fs3037c

5. Set the tray. Confirm that the paper lift finished its elevation to the top by hearing the sound of the paper lift motor.
6. Pull out the tray again. Remove 2 screws [1] to remove the paper feed cover [2].

7. Pull the plunger [2] of the pick-up solenoid [1] to measure the gap "A" between the pick-up roller [3] and the paper lift plate [4] with the gap gauge.
Standard value A = 0.1mm to 1.5mm
If it is not within the standard value, follow step8 and after.
8. Loosen a screw [5].

Note

- Before loosening the screw [5], record the position of the pick-up solenoid [1] with the marking line [6].

9. With the plunger [2] pulled, adjust the position of the pick-up solenoid [1] so that the standard value can be obtained for the gap A between the pick-up roller [3] and the paper lift plate [4].
10. Tighten the screw [5] to fix the pick-up solenoid [1].
11. Replace the stopper of step4 to the original position.
12. Insert a paper, and set the tray.
13. Perform copying/printing to confirm that the no feed does not occur.
14. Reinstall the above parts following the removal steps in reverse.

Note

- After the adjustment, be sure to replace the stopper of the release lever to the original position.

9.6 Paper lift plate skew adjustment**(1) Usage**

Perform the paper lift plate skew adjustment after replacing a lift wire or when the paper lift plate is skewed.

(2) Procedure

1050fs3038c

1. Pull out the paper feed tray.
2. If any paper remaining, remove it.
3. Loosen a screw [1].
4. With the release lever [2] placed at its original position, hold the stopper [3] and tighten the screw [1] to fix the stopper.

1050fs3039c

5. Set the tray. Confirm that the paper lift finished its elevation to the top by hearing the sound of the paper lift motor.
6. Pull out the tray again. Remove 2 screws [2] of the stopper of the rails [1] on the right and left side. Pull out the tray.

1050fs3040c

7. Remove 2 screws (with washers) on the right and left side [1] and 2 screws on the upper side [2].

Note

- Removing the screws [1] and [2] causes the tray front cover [3] to fall. Support the cover not to drop.

8. Disconnect the connector [4] to remove the tray front cover [3].

Note

- Be sure to connect the connector as you place it. Otherwise, all trays in the main body become unable to be pulled out.

9. Lift up the pick-up roller [1].
10. In case the paper guide [2] is open, close it to the smallest-size position.
11. Remove the screw [3], and place them temporarily in the slotted screw hole [4].
12. While holding the pulley placing plate being placed with the screw [5], loosen the screw [5] to adjust the skewed paper lift plate [7] with the marking line [6].
13. Confirm that the paper lift plate is horizontal, and fix the screw [5] and [8].
14. Pull down the pick-up roller [1].
15. Place the tray front cover.
16. Insert a paper, and set the tray.
17. Perform copying/printing to confirm that the no jam occurs, and that papers are properly fed.
18. Reinstall the above parts following the removal steps in reverse.

Note

- After the adjustment, be sure to replace the stopper of the release lever to the original position.

9.7 Registration roller paper skew adjustment**(1) Usage**

Perform this adjustment when there is skew in the registration section.

(2) Procedure

1. Remove the screw [1] and then make sure the graduation of the screw [1].
2. Loosen 3 screws [2].
3. Move the registration section [3] to the arrow on the basis of the graduation.
4. Tighten the screw [1] and screws [2].
5. Perform copy/printing to check the paper skew.
6. In case it is not improved, repeat steps 1 to 5.

9.8 Fusing roller /Lw pressure adjustment (951 only)

(1) Usage

Conduct this adjustment when the paper is curled and not conveyed stably. Be careful that it is possible that excess adjustment cause the insufficient fusing.

(2) Procedure

1. Loosen 2 screws [1] and then remove the fusing cover [2].

2. Push the handle [1] in the arrow-marked direction [2], and then release the lock.

3. Rotate the handle [1] to confirm that the locks [6] are inserted into the positions [2], [3], [4] and [5], and then release the hand from the handle.
 - [2]: Strong fusing pressure (Default)
 - [3]: Medium fusing pressure
 - [4]: Weak fusing pressure
 - [5]: Release the fusing (Very weak fusing pressure)

Note

- The fusing position is set to [2] by default.
- In order to reform the curled paper, lower the fusing pressure step by step.

4. After the adjustment, execute the test print to check the curl of the paper.

9.9 Registration roller pressure adjustment

(1) Usage

Perform this adjustment when the power for paper conveyance by the registration roller is not appropriate.

(2) Procedure

1. Remove the paper dust removing brush for the registration roller / Lw. (Refer to [F.5.9.2 Cleaning of the paper dust removing brush for the registration roller /Lw](#))
2. Remove the paper dust removing brush for the registration roller / Lw. (Refer to [F.5.9.2 Cleaning of the paper dust removing brush for the registration roller /Lw](#))
3. Remove the paper dust removing brush for the registration roller / Up. (Refer to [F.5.9.3 Cleaning of the paper dust removing brush for the registration roller /Up](#))
4. Remove the registration section. (Refer to [F.5.9.12 Removing/ reinstalling the registration section](#))
5. Remove the screw [1] and then remove the knob [2].
6. Remove the washer [3] and the bearing [4].
7. Remove 2 screws [5] and remove the roller gear /Rt [6].

8. Change the positions to hook 2 springs [1] according to the power for conveyance of the registration roller.
 - [2] and [5]: Medium conveyance power (Default)
 - [2] and [3]: Weak conveyance power
 - [4] and [5]: Strong conveyance power

Note

- When "Weak conveyance power" is set, the paper leading edge timing position for thick is longer compared to plain.

9. After adjustment, conduct a test print to check the condition of the power for conveyance of the registration roller.

(3) Case 1

When creases by the registration roller occur, set " Weak conveyance power". In the following, an envelope is used as an example.

- When using an envelope, small creases may occur on the folds [1].
- Particularly, creases are likely to occur to envelopes which are around 120mm in the direction of the main scan.
- The power for conveyance by the registration roller moves the bent of envelope to the fold and creases occur.
- Make the power for conveyance by the registration roller weak to prevent creases.

(4) Case 2

When the paper leading edge timing position for thick is longer compared to plain, set "Strong conveyance power".

Note

- The power of conveyance also changes according to dirt and abrasion of the roller. Perform this adjustment when the power for paper conveyance is not improved after replacing or cleaning the registration roller.

10. MECHANICAL ADJUSTMENT DF-615/616

10.1 Paper skew adjustment

(1) Usage

Perform this adjustment when the image skew occurs.

(2) Procedure

df603fs3001c

df603fs3002c

1. Make a copy in the single-sided original - single-sided copy mode, and check the original skew pattern (pattern A [4] or pattern B [5]) of the image [3] on the copy paper [2] to the copy paper feed direction [1].

2. Open the open-close cover [1].
3. Loosen the screw [2] and release the fixing of the registration roller bracket [3].
4. According to the original skew pattern, move the registration roller bracket [3] by 1 division [4] in the following direction.
In the pattern A: Move the registration roller bracket [3] to the lower side (direction down towards original feed flow).
In the pattern B: Move the registration roller bracket [3] to the upper side (direction up towards original feed flow).
5. Repeat the steps 2 to 4 until the original skew is within the specification (0.5% or less).
Specification: Paper skew $\pm 0.5\%$ or less (paper skew against the side parallel to the paper feed direction)

10.2 Hinge pressure adjustment

(1) Usage

In this adjustment, the spring pressure when the DF is opened and closed is adjusted.

(2) Procedure

1. Close the DF.
2. Loosen the nuts [1], 1 each provided on both sides.
3. Open the DF.
4. Rotate the adjusting screw [2] to adjust the spring pressure of the hinge.
Tighten (clockwise): Spring pressure decreased.
Loosen (counterclockwise): Spring pressure increased.
5. Close the DF.
6. Tighten securely the nuts [1], 1 each provided on both sides.

10.3 Height adjustment**(1) Usage**

This adjusts the DF height.

(2) Procedure

1. Close the DF.
2. Check to see if each of 2 stopper pieces [1] on the DF side comes in touch with the dent [2] in the original stopper plate /Lt on the main body side.

3. When the stopper pieces do not get contact with the dent on the original stopper plate /Lt at the same time, make adjustments by turning the adjusting screw A [1].

Note

- For the adjustment of the DF height, be sure to make adjustments by turning the adjusting screw A [1] as a rule. When a satisfactory adjustment cannot be obtained with the adjusting screw A [1], make adjustments turning the adjusting screws A [1] and B [2] alternately.

10.4 Adjustment to prevent false detection by the original detection sensor**(1) Usage**

When the original count sensor (PS310) and the original size sensors /Lt (PS303) and /Rt (PS302) above the original feed tray make false detection due to the angle of incident of external light such as a fluorescent light, change the installation angle of the sensor.

(2) Procedure

1. Raise the original feed tray [1].
2. Remove 3 screws [2] and then remove the original feed tray cover /Lw [3].

3. Expand the claw [1] a little wider and remove the original size sensors /Rt (PS302) [2] and /Lt (PS303) [3] and the original count sensor (PS310) [4].

Note

- Be careful not to spread the claw [1] too wide. Otherwise, it may break off.

4. Remove 2 screws [5] and then remove the sensor holder [6].

5. Rotate the sensor holder [1] up to 180DEGREE from side to side and fasten it with 2 screws [2].

Note

- When tilting the sensor at 10° forward or backward to the upright:
Install the sensor holder to the attaching hole [2] with the projection [3] placed on the side opposite to the triangular mark (▲) [6]. In this way, the sensor can be tilted to 10° forward. Installing the sensor holder to the attaching hole [7] with the projection [3] placed on the triangular mark (▲) [6] side allows the sensor to be tilted 10° backwards. In either case, install the sensor on the side [5] with no projection [3].
- When installing the sensor turned directly upward:
With the projection [3] put on the triangular mark (▲) [6] side, install the sensor holder [1] to the attaching hole [2]. Install the sensor on the side [4] provided with the projection [3].

[2] [1] df603fs3009c

6. Install the sensor [3] to the sensor holder [4] so that the sensor face [1] gets into the sensor window [2] as seen from above the original feed tray.

Note

- Be sure to check to see if the sensor [3] is securely held by the claw [5].
- Be careful that the sensor face [1] does not get damaged, and also be careful not to soil it with grimy hands.

7. Reinstall the above parts following the removal steps in reverse.

10.5 Centering sensor switchover adjustment (DF-615 only)

(1) Usage

Adjust the installation position of the centering sensor /Fr (PS320) according to the original sizes (A4, A3 / 8 1/2 x 11, 11 x 17) mainly used by the user.

Note

- Be sure to conduct in advance "ADF centering sensor sensitivity adjustment." (Refer to [I.5.3.41 ADF Centering Sensor Adjustment \(ADF Adjustment\) \(1250/1052 only\)](#))

(2) Procedure

1. Remove the screw [1] to remove the sensor cover [2].

df603fs3010c

df603fs3011c

2. Remove the screw [1] and install the sensor mounting plate [2] with the projection [5] set to the side stamped with "A4" [3] or to the "LT (8 1/2 x 11)" side [4].
 3. Reinstall the above parts following the removal steps in reverse.
- Reference:
- Turning OFF/ON the power switch (SW2) automatically recognizes the A4 position or the LT position.

11. MECHANICAL ADJUSTMENT PF-703

11.1 Paper height adjustment

(1) Usage

Conduct the paper height adjustment when a no feed condition, paper edge folding, or jams occur repeatedly during feeding paper, or in the case of feeding paper with a large amount of curl.

The gap between the height of the paper top and the height of the paper path on the paper feed belt is decided with the paper height adjustment.

(2) Procedure

a0g6f3c100ca

1. Pull out the paper feed tray.
2. Loosen the screw [1] and move to [2].
3. Put the paper and set the tray. Confirm that the paper lift finished its elevation to the top by hearing the sound of the paper lift motor. Pull out the tray again.

a0g6f3c101ca

4. Check the heights of the paper top [1] and the upper limit sensors / 1 (PS5), /2 (PS6), and /3 (PS10) [2].

a0g6f3c102ca

5. Loosen the screw [1] and move back to the original position, and then lower the paper lift plate.

a0g6f3c103ca

6. Loosen the screw [1] and adjust the height of the upper limit sensors /1 (PS5), /2 (PS6), and /3 (PS10) [2].

Note

- The shift amount of the upper limit sensors /1 (PS5), /2 (PS6), and /3 (PS10) [2] is the shift amount of the paper height.

7. Perform copying/printing to confirm that the no feed or jam do not occur. In case they are not improved, repeat steps 1 to 6.

11.2 Centering adjustment (for each tray)

(1) Usage

This adjustment is made when the centering of paper varies each paper supplied from the trays 1, 2 and 3. The centering is automatically adjusted in the image-processing unit, and this adjustment is made when a centering exceeding the range of auto correction (+/- 5mm) occurs or jam occurs on paper more than 324mm width in the main scan direction.

Note

- Select [Detect] from [Setting Menu] - [06 Administrator Setting] - [01 System Setting] - [06 Expert Adjustment] - [03 Mis-centering Detect JAM Set.] to stop the operation by the jam when the centering exceeding the range of auto correction occurs.
- In this case, the jam code is J-3112.
- When a mis-centering of the same kind occurs in all of the fed paper from the trays /1 to /3, be sure to conduct "[I.12.6 Centering Adjustment \(PF\)](#)".

(2) Procedure

a0g6f3c104ca

1. Select the tray to adjust, selecting [MACHINE] - [Tray Setting] and then select [OFF] from [Change Setting] - [Mis-centerDetect].
2. Perform copying/printing without automatic correction to check the centering of image.
3. Pull out the paper feed tray.
4. If any paper remaining, remove it.
5. If the paper guide [1] is at the small-size position, stretch the guide.
6. Loosen 2 screws [2].
7. Move the paper guide [1]. According to the centering you checked in step2, adjust the center position using the marking line [3].
8. Tighten 2 screws [2].
9. Insert a paper, and set the tray.
10. Make a copy/print and check to see if the centering is within the standard value (+/- 2mm).
11. When not up to the standard value, repeat the steps 3 to 10.
12. Select the tray to adjust, selecting [MACHINE] - [Tray Setting] and then select [ON] from [Change Setting] - [Mis-centerDetect].

11.3 Centering Adjustment (PF)

(1) Usage

Conduct this adjustment when a mis-centering of the same kind occurs in all the fed paper from the PF trays 1, 2 and 3. The centering is automatically adjusted in the image-processing unit, and this adjustment is made when a centering exceeding the range of auto correction (+/- 5mm) occurs or jam occurs on paper more than 324mm width in the main scan direction.

Note

- Select [Detect] from [Setting Menu] - [06 Administrator Setting] - [01 System Setting] - [06 Expert Adjustment] - [03 Mis-centering Detect JAM Set.] to stop the operation by the jam when the centering exceeding the range of auto correction occurs.
- In this case, the jam code is J-3112.
- When mis-centering of paper is different for each of the trays 1 to 3, be sure to conduct "[I.12.5 Centering adjustment \(for each tray\)](#)".

(2) Procedure

pf701fs3007d

1. Select the tray to adjust, selecting [MACHINE] - [Tray Setting] and then select [OFF] from [Change Setting] - [Mis-centerDetect].
2. Make a copy/print for each of the trays 1 to 3, and make sure of the mis-centering of image with no automatic adjustment made.
3. Turn OFF the sub power switch (SW2) and the main power switch (SW1) of the main body and unplug the power plug from the power outlet.
4. Detach the PF from the main body. (Refer to "Installation manual.")
5. Loosen 3 screws [2] of the PF positioning bracket /Fr [1] on the main body side.
6. Move the PF positioning bracket /Fr [1] back and forth, and adjust the center position referring to the amount of discrepancy found in the step2.
7. Tighten 3 screws [2].
8. Connect the PF to the main body.
9. Connect the power plug of the main body to the power outlet and turn on the main power switch (SW1) and the power switch (SW2) of the main body.
10. Make a copy/print for each of the trays 1 to 3 to check the mis-centering to see if it is within the standard value ($\pm 2\text{mm}$).
11. When not up to the standard value, repeat the steps 3 to 10.
12. Select the tray to adjust, selecting [MACHINE] - [Tray Setting] and then select [ON] from [Change Setting] - [Mis-centerDetect].

11.4 Tilt adjustment**(1) Usage**

Conduct this adjustment when the copy/print image tilt is found in all of the fed paper from the PF trays /1, /2 and /3.

(2) Procedure

pf701fs3008d

1. Turn OFF the sub power switch (SW2) and the main power switch (SW1) of the main body and unplug the power plug from the power outlet.
2. Detach the front side of the PF from the main body. (Refer to "Installation manual.")
3. Loosen 2 screws [2] of the positioning mounting metal fitting /Fr [1] on the PF side.
4. Move the positioning mounting metal fitting /Fr [1] back and forth, and adjust the tilt referring to the marking-off line [3].
5. Tighten 2 screws [2].
6. Connect the power plug of the main body to the power outlet and turn on the main power switch (SW1) and the power switch (SW2) of the main body.
7. Make a copy/print for each of the trays 1 to 3 and check to see if the tilt of the image has been adjusted.
8. When it has not been adjusted, repeat the steps 1 to 7.

11.5 Horizontal adjustment**(1) Usage**

Conduct this adjustment when the device cannot be placed in a horizontal position or when any discrepancy in height and/or tilt is found between the device and the main body.

Note

- Conducting horizontal adjustments may cause slipping-off of the position relative to the main body. So, after completion of adjustments, be sure to make a test copy/print to check to see if the paper feed is properly made from the PF.

(2) Procedure

pf701fs3009d

1. Turn OFF the sub power switch (SW2) and the main power switch (SW1) of the main body and unplug the power plug from the power outlet.
2. Detach the PF from the main body. (Refer to "Installation manual.")
3. Loosen the caster nuts [1] provided at the 2 places.
4. Use a wrench to rotate the caster nuts [2] provided at the 2 places and make horizontal adjustments of the device.

Note

- Be sure to take into account the height against the main body when making adjustments.

5. Rotate slightly by hand the caster nuts [2] at the 2 places to check to see if there is any caster being raised.

Note

- When any caster is found raised, use a wrench to rotate the nut [2] to extend the caster until you get a feel for secure contact.

6. Fasten the nut [2] with a wrench and tighten up the nut [1].

Note

- Be careful that when the nut [1] is tightened up with the nut [2] being not fastened, the nut [2] also rotates together with the nut [1], thus resulting in an incorrect position adjustment.

12. MECHANICAL ADJUSTMENT PF-706

12.1 Paper feed pick-up amount adjustment

(1) Usage

When a no feed condition occurs repeatedly while feeding paper, conduct the paper feed pick-up amount adjustment.

(2) Procedure

pf701fs3001c

1. Pull out the paper feed tray.
2. If any paper remaining, remove it.
3. Push in the release lever [1] and insert the screw [2] into the hole [3] to fasten the release lever [1].
4. Set the tray. Confirm that the paper lift finished its elevation to the top by hearing the sound of the paper lift motor. Pull out the tray again.
5. Remove the stopper screws, 1 each, attached on the right and left rails and pull the tray further out.

pf701fs3002c

6. Remove 3 screws [1] and remove the paper feed cover [2].

a08rf3c001ca

7. Pull the plunger [2] of the pick-up solenoid [1] and measure the clearance between the pick-up roller [3] and the lift plate [4] with a feeler gauge.
Standard value A = 0.1mm to 1.5mm
If it is not within the standard value, follow step8 and after.
8. Loosen a screw [5].

Note

- Before loosening the screw [5], record the position of the pick-up solenoid [1] with the marking line [6].

9. With the plunger [2] pulled, adjust the position of the pick-up solenoid [1] so that the clearance between the pick-up roller [3] and the lift plate [4] gets to the specified value.
10. Tighten the screw [5] to fix the pick-up solenoid [1].
11. Insert a paper, and set the tray.

Note

- When setting the tray, be sure to bring down the pick-up solenoid (in normal condition). Setting the tray with the paper feed cover removed and the pick-up roller brought up may cause damage to the pick-up roller.

12. Perform copying/printing to confirm that the no feed does not occur.
13. Reinstall the above parts following the removal steps in reverse.

Note

- After completion of adjustment, be sure to remove the screw of the release lever.

12.2 Pick-up roller height adjustment

(1) Usage

Conduct the pick-up roller height adjustment when a no feed condition, paper edge folding, or jams occur repeatedly during feeding paper, or in case of feeding paper with a large amount of curl.

According to the pick-up roller height adjustment, the height of the upper most paper and the paper through height of the paper feed roller are decided.

Note

- On performing the pick-up roller height adjustment, the paper feed pick-up amount is changed. Be sure to confirm the paper feed pick-up amount in the paper feed pick-up amount adjustment.

(2) Procedure

pf701fs3010c

1. Pull out the paper feed tray.
2. If any paper remaining, remove it.
3. Push in the release lever [1] and insert the screw [2] into the hole [3] to fasten the release lever [1].
4. Set the tray. Confirm that the paper lift finished its elevation to the top by hearing the sound of the paper lift motor. Pull out the tray again.
Then pull out the tray again. Remove the stopper screw of the tray rail and further pull out the tray.

5. Remove 3 screws [1] and remove the paper feed cover [2].

6. Check if the actuator [1] of the pick-up roller assy meets the center [3] of the upper limit sensor/1 (PS2), /2 (PS6), /3 (PS10) [2]
7. Remove the pick-up roller section [4]. (Refer to [F.8.2.1 Removing/reinstalling the pick-up roller assy and the separation roller assy](#))

8. Make a mark [2] of the height of the upper limit sensor mounting plate [1].
9. Remove 2 screws [3], attach and fasten it temporarily on the slotted hole side [4] of the upper limit sensor mounting plate [1].
10. Make vertical adjustments of the upper limit sensor mounting plate [1] and fasten it with the screws [3].

Note

- Be sure to install the upper limit sensor mounting plate [1] so that it becomes level.

Reference:

- Raising the position of the upper limit sensor brings down the pick-up roller [5] (resulting in the increased difference [7] of elevation between the paper feed roller [6] and the pick-up roller [5]).
- Lowering the position of the upper limit sensor brings up the pick-up roller [5] (resulting in the reduced difference [7] of elevation between the paper feed roller [6] and the pick-up roller [5]).
- When the printed page is folded, when paper jam occurs frequently, or when feeding paper with a large amount of curl, raise the upper limit sensor mounting plate.
- When feeding convexly curled paper, lower the upper limit sensor mounting plate.

11. Reinstall the pick-up roller assembly.

Note

- When specifying the tray with the pick-up roller not installed, the paper lift plate does not stop at the upper limit, thus damaging the tray. Be sure to install the pick-up roller.

12. Insert a paper, and set the tray.
13. Perform copying/printing to confirm that the no feed or jam do not occur. In case they are not improved, repeat steps 7 to 14.
14. Check the paper feed pick-up amount. (Refer to [1.12.1 Paper feed pick-up amount adjustment](#))

15. Reinstall the above parts following the removal steps in reverse.

Note

- After completion of adjustment, be sure to remove the screw of the release lever.

12.3 Pick-up roller load adjustment

(1) Usage

In case a no feed jam occurs frequently, perform the pick-up roller load adjustment.

(2) Procedure

1. Pull out the paper feed tray.
2. In the pick-up roller assy [1], put paper feed assist plate [3] on the paper feed assist plate holder [2], and fix them with accompanying screw (M3 x 8mm) [4].

Note

- Up to 8 paper feed assist plates can be attached.
For the number of plates to be attached, refer to "1.8.2.11 Overlay printing adjustment" and "1.8.2.14 User setting of each paper brand".
- The paper feed assist plate is approx. 10g each.

3. Set the tray.
4. Perform copying/printing to check whether the no feed or the double feed occurs or not.

Note

- When a no feed condition recurs, increase the number of the paper feed assist plates. When a double feed condition occurs, decrease the number of the paper feed assist plates.

5. In case either of no feed or double feed occurs, repeat steps 2 to 4.

12.4 Separation pressure adjustment

(1) Usage

When a no feed or double feed condition occurs repeatedly, conduct the separation pressure adjustments.

Note

- The no-feed or multi-feed error is most likely to occur due to paper type or operating environment. No feed tends to occur in low temperature environment, whereas high temperature environment results in a higher rate of multi-feed.
- Excess adjustment may reverse the symptom.

(2) Procedure

1. Pull out the paper feed tray.
2. Change the position of the spring adjustment lever [1].
The separation pressure is strengthened when the lever moves to the direction [2] and is weakened when the lever moves to the direction [3].

Weak: a double feed jam is improved.

Strong: a no feed jam is improved.

Reference:

- The pressure applied to the spring increases/decreases by about 10% increment.

3. Make a copy/print with the tray set, and check to see if a no feed or double feed condition occurs.
4. In case either of no feed or double feed occurs, repeat steps 2 to 3.

12.5 Centering adjustment (for each tray)

(1) Usage

This adjustment is made when the centering of paper varies each paper supplied from the trays 1, 2 and 3. The centering is automatically adjusted in the image-processing unit, and this adjustment is made when a centering exceeding the range of auto correction (+/- 5mm) occurs or jam occurs on paper more than 324mm width in the main scan direction.

Note

- Select [Detect] from [Setting Menu] - [06 Administrator Setting] - [01 System Setting] - [06 Expert Adjustment] - [03 Mis-centering Detect JAM Set.] to stop the operation by the jam when the centering exceeding the range of auto correction occurs.
- In this case, the jam code is J-3112.
- When a mis-centering of the same kind occurs in all of the fed paper from the trays /1 to /3, be sure to conduct "I.12.6 Centering Adjustment (PF)."

(2) Procedure

1. Select the tray to adjust, selecting [MACHINE] - [Tray Setting] and then select [OFF] from [Change Setting] - [Mis-centerDetect].
2. Perform copying/printing without automatic correction to check the centering of image.
3. Pull out the paper feed tray.
4. If any paper remaining, remove it.
5. If the paper guide [1] is at the small-size position, stretch the guide.
6. Loosen 2 screws [2].
7. Move the paper guide [1]. According to the centering you checked in step2, adjust the center position using the marking line [3].
8. Tighten 2 screws [2].
9. Insert a paper, and set the tray.
10. Make a copy/print and check to see if the centering is within the standard value (+/- 2mm).
11. When not up to the standard value, repeat the steps 3 to 10.
12. Select the tray to adjust, selecting [MACHINE] - [Tray Setting] and then select [ON] from [Change Setting] - [Mis-centerDetect].

12.6 Centering Adjustment (PF)**(1) Usage**

Conduct this adjustment when a mis-centering of the same kind occurs in all the fed paper from the PF trays 1, 2 and 3. The centering is automatically adjusted in the image-processing unit, and this adjustment is made when a centering exceeding the range of auto correction (+/- 5mm) occurs or jam occurs on paper more than 324mm width in the main scan direction.

Note

- Select [Detect] from [Setting Menu] - [06 Administrator Setting] - [01 System Setting] - [06 Expert Adjustment] - [03 Mis-centering Detect JAM Set.] to stop the operation by the jam when the centering exceeding the range of auto correction occurs.
- In this case, the jam code is J-3112.
- When mis-centering of paper is different for each of the trays1 to 3, be sure to conduct "I.12.5 Centering adjustment (for each tray)".

(2) Procedure

pf701fs3007d

1. Select the tray to adjust, selecting [MACHINE] - [Tray Setting] and then select [OFF] from [Change Setting] - [Mis-centerDetect].
2. Make a copy/print for each of the trays 1 to 3, and make sure of the mis-centering of image with no automatic adjustment made.
3. Turn OFF the sub power switch (SW2) and the main power switch (SW1) of the main body and unplug the power plug from the power outlet.
4. Detach the PF from the main body. (Refer to "Installation manual.")
5. Loosen 3 screws [2] of the PF positioning bracket /Fr [1] on the main body side.
6. Move the PF positioning bracket /Fr [1] back and forth, and adjust the center position referring to the amount of discrepancy found in the step2.
7. Tighten 3 screws [2].
8. Connect the PF to the main body.
9. Connect the power plug of the main body to the power outlet and turn on the main power switch (SW1) and the power switch (SW2) of the main body.
10. Make a copy/print for each tray1 to tray3 to check the mis-centering to see if it is within the standard value ($\pm 2\text{mm}$).
11. When not up to the standard value, repeat the steps 3 to 10.
12. Select the tray to adjust, selecting [MACHINE] - [Tray Setting] and then select [ON] from [Change Setting] - [Mis-centerDetect].

12.7 Tilt adjustment**(1) Usage**

Conduct this adjustment when the copy/print image tilt is found in all of the fed paper from the PF trays /1, /2 and /3.

(2) Procedure

pf701fs3008c

1. Turn OFF the sub power switch (SW2) and the main power switch (SW1) of the main body and unplug the power plug from the power outlet.
2. Detach the front side of the PF from the main body. (Refer to "Installation manual.")
3. Loosen 2 screws [2] of the positioning mounting metal fitting /Fr [1] on the PF side.
4. Move the positioning mounting metal fitting /Fr [1] back and forth, and adjust the tilt referring to the marking-off line [3].
5. Tighten 2 screws [2].
6. Connect the power plug of the main body to the power outlet and turn on the main power switch (SW1) and the power switch (SW2) of the main body.
7. Make a copy/print for each of the trays /1 to /3 and check to see if the tilt of the image has been adjusted.
8. When it has not been adjusted, repeat the steps 1 to 7.

12.8 Horizontal adjustment

(1) Usage

Conduct this adjustment when the device cannot be placed in a horizontal position or when any discrepancy in height and/or tilt is found between the device and the main body.

Note

- Conducting horizontal adjustments may cause slipping-off of the position relative to the main body. So, after completion of adjustments, be sure to make a test copy/print to check to see if the paper feed is properly made from the PF.

(2) Procedure

pf701fs3009c

1. Turn OFF the sub power switch (SW2) and the main power switch (SW1) of the main body and unplug the power plug from the power outlet.
2. Detach the PF from the main body. (Refer to "Installation manual.")
3. Loosen the caster nuts [1] provided at the 2 places.
4. Use a wrench to rotate the caster nuts [2] provided at the 2 places and make horizontal adjustments of the device.

Note

- Be sure to take into account the height against the main body when making adjustments.

5. Rotate slightly by hand the caster nuts [2] at the 2 places to check to see if there is any caster being raised.

Note

- When any caster is found raised, use a wrench to rotate the nut [2] to extend the caster until you get a feel for secure contact.

6. Fasten the nut [2] with a wrench and tighten up the nut [1].

Note

- Be careful that when the nut [1] is tightened up with the nut [2] being not fastened, the nut [2] also rotates together with the nut [1], thus resulting in an incorrect position adjustment.

13. MECHANICAL ADJUSTMENT LU-409/410

13.1 Separation pressure adjustment

(1) Purpose

- Adjust the separation pressure which occurs during the paper feeding, and prevent the no-feed or the double-feed jam.

(2) Usage

Conduct the adjustment when there occurs a no-feed or double-feed jam repeatedly.

Note

- Do not make an excessive adjustment. Doing so may reverse the symptoms.
- Paper type and ambient temperature/humidity can be a major cause of the no-feed or multi-feed jam. For example, no-feed jam tends to occur in low temperature, and multi-feed jam does in high temperature. Make sure to carry out this adjustment with that in mind.

(3) Procedure

- Remove the LU from the main body.
- Disconnect the hooked end [1] of the spring from the tab, and attach it to another tab on the left [2] or right [3] side of the center tab to raise or reduce the separation pressure. The 5 tabs correspond to 5 pressure levels. Attach the hooked end of the spring to a tab on the [2] side to raise the pressure, or attach it to a tab on the [3] side to reduce the pressure.
Reducing pressure: lowers multi-feed jam rate.
Raising pressure: lowers no-feed jam rate.
Reference: The spring force changes in increments of about 10%.
- Reinstall the LU to the main body.

Note

- After completion of installation, be sure to make a print and check to see if a no feed jam or double feed jam does not occur.

13.2 Paper feed roller pressure adjustment (LU-410 only)

(1) Purpose

- Increase the pressure in feeding paper from LU to prevent the no feed.

(2) Usage

- Conduct this adjustment when no feed occurs even with the separation pressure adjustment of LU.

Note

- Adjusting the feed roller pressure changes the pick-up release amount. So after completion of adjustment, be sure to check the pick-up release amount.
- Be sure to purchase the paper feed assist plate (P/N: 13FG4062*) separately since it is supplemental part.

(3) Procedure

- Open the upper door [1].
- Remove the hook [3] of spring [2] from the paper feed guide plate [4].

3. Install the paper feed assist plate [1] to the paper feed roller unit plate [2] with 2 screws [3].
 4. Perform printing to confirm that the no feed does not occur.
- Note**
- When a no feed condition recurs, increase the number of paper feed assist plates. When a double feed condition occurs, decrease the number of plates.
 - Up to 6 paper feed assist plates can be attached.
5. In case either of no feed or double feed occurs, repeat steps 3 to 4.
 6. Check the pick-up release amount. (Refer to [1.13.7 Pick-up roller separation adjustment](#))

13.3 Paper lift plate horizontal adjustment

(1) Purpose

- Get back the inclined paper lift board to the horizontal position.

(2) Usage

- Conduct this adjustment when the paper feed jam often occurs or when the lift wire is replaced.

(3) Procedure

(a) Adjustments for LU-409

1. Turn on the main power switch (SW1) and the sub power switch (SW2) of the main body. After the paper lift plate stops at its uppermost position (listen to the sound of the paper lift motor to figure out the stop status), turn off the both switches.
2. Remove the LU from the main body.
3. Remove the following covers.
 - Left cover (Refer to [G.6.2.3 Right cover](#))
 - Front cover (Refer to [G.6.2.4 Front cover](#))
 - Rear cover (Refer to [G.6.2.5 Rear cover](#))
4. Loosen 2 screws [2] of the adjustment bracket /Fr [1] and 2 screws [4] of the adjustment bracket /Rr [3].
5. Using the marking-off line [5] as a guide, adjust the horizontal level of the paper lift plate [6] with the adjusting screws [7] and [8].
6. Tighten up 2 screws [2] and 2 screws [4].
7. Reinstall the above parts following the removal steps in reverse.

Note

- After completion of installation, be sure to make a print and check to see if a no feed jam or double feed jam does not occur.

(b) Adjustments for LU-410

1. Turn on the main power switch (SW1) and the sub power switch (SW2) of the main body. After the paper lift plate stops at its uppermost position (listen to the sound of the paper lift motor to figure out the stop status), turn off the both switches.
2. Open the upper door.
3. Loosen 2 screws [1] on the front side and 2 screws [2] on the rear side.
4. Using the marking-off lines [3] and [4] as a guide, adjust the horizontal level of the paper lift plate [5] with the adjusting screws [6] and [7].
5. Tighten up 2 screws [1] and 2 screws [2].
6. Reinstall the above parts following the removal steps in reverse.

Note

- After completion of installation, be sure to make a print and check to see if a no feed jam or double feed jam does not occur.

13.4 Paper centering adjustment**(1) Purpose**

- Adjust when the mis-centering between the center of the printed image and the paper occurs on the print from LU.

(2) Usage

- Adjust the skew between the center of the printed image and the paper.

(3) Procedure

1. Select the tray to adjust, selecting [MACHINE] - [Tray Setting] and then select [OFF] from [Change Setting] - [Mis-centerDetect].
2. Make a print of the test pattern No.16 and check the amount of centering with no adjustment made.
3. Load about 100 sheets of paper in the LU. (less than 100 may cause the paper becoming warped when the guide plate is pressed against it.)
4. Close the upper door. And turn off the main power switch (SW1) and the sub power switch (SW2) after the paper lift plate stops at its uppermost position (listen to the sound of the paper lift motor to figure out the stop status).
5. Remove the right cover. (Refer to [G.6.2.3 Right cover](#))
6. Open the front door and loosen the screw [2] of the paper width adjustment section [1].
7. Open the upper door and loosen 2 screws [4] of the guide plate /Fr [3] and 2 screws [6] of the guide plate /Rr [5].
8. Loosen the 2 screws [8] of the centering bracket [7].
9. Slide the centering bracket [7] aligning the line on the both ends of the bracket with the marking-off line [9], and tighten the 2 screws [8].
10. Press the guide plates /Fr [3] and /Rr [5] against the paper, tighten up screws [2], [4] and [6], 5 in all.

Note

- When pressing the guide plates against paper, make sure not to press them too much, or a paper jam may occur.

11. Reinstall the above parts following the removal steps in reverse.

Note

- Make some test prints to check to see that the off-centered amount falls within the allowable range.
- After checking that it is inside the specified value, be sure to enable the software DIPSW12-3 (data = 0).

13.5 Paper skew adjustment**Note**

- Conduct this adjustment when there is a difference in the inclination found with the main body tray and the paper skew. However, this method has a limited effect since all of the paper supplied is adjusted at the registration section.
- An adjustment is made at a different place according to the case in which there occurs a skew of the same inclination in all of the paper supplied from the LU or in which there occurs a skew at random for each sheet of paper.

(1) Preparation

1. Make the continuous print of the test pattern (No.16) to check to see if there is no skew.
2. Depending on the inclination of a skew, conduct either of the following adjustment B and C.
Skew in the same inclination for the entire LU: Adjustment procedure B
Skew at random: Adjustment procedure C

(2) Adjustment procedure taken when there is a skew found with all of the paper supplied from the LU.

1. Open the front door.
2. Loosen 2 screws [1].
3. Using the marking-off lines [2] as a guide, adjust the position of the positioning bracket [3].

Note

- Be sure to move the positioning bracket [3] in parallel so that it comes to the same position as the marking-off lines [2] in front and rear.

4. Make the continuous print of the test pattern (No.16) to check to see if there is no skew.

(3) Procedure for adjustment when there occurs an irregular skew

1. Load about 100 sheets of paper in the LU. (less than 100 may cause the paper becoming warped when the guide plate is pressed against it.)
2. Turn on the main power switch (SW1) and the sub power switch (SW2) of the main body. After the paper lift plate stops at its uppermost position (listen to the sound of the paper lift motor to figure out the stop status), turn off the both switches.
3. Open the front door and loosen the screw [2] of the paper width adjustment section [1].
4. Open the upper door and loosen 2 screws [4] of the guide plate /Fr [3] and 2 screws [6] of the guide plate /Rr [5].
5. Press the guide plates /Fr [3] and /Rr [5] against the paper, tighten up screws [2], [4] and [6], 5 in all.

Note

- The size indication of the guide plate is given so that it becomes 2 mm larger than the standard size indication. This clearance of 2 mm may cause a skew depending on the type of paper.
- When pressing the guide plate against the paper, be careful not to apply too much force. Otherwise, the paper feed can be negatively affected, thus resulting in a jam.

6. Make the continuous print of the test pattern (No.16) to check to see if there is no skew.

13.6 (Maximum) Paper feed height adjustment

(1) Usage

Conduct this adjustment when the following conditions occur.

- When a no feed condition is not improved by conducting the paper feed roller pressure adjustment.
- When there occurs a no feed jam in which a thick paper gets stuck with the entrance guide plate (guide plate of the separation roller section).
- When a double feed jam is not improved by conducting the separation pressure adjustment.

Note

- Adjusting the paper feed height (upper limit) changes the pick-up release amount. So, be sure to conduct the pick-up release amount adjustment after this adjustment. (Refer to [I.13.7 Pick-up roller separation adjustment](#))

(2) Procedure

15ssf3c006na

1. Turn on the main power switch (SW1) and the sub power switch (SW2) of the main body. After the paper lift plate stops at its uppermost position (listen to the sound of the paper lift motor to figure out the stop status), turn off the both switches.
2. Remove the paper feed roller unit. (Refer to [F.9.2.2 Removing/installing paper feed roller unit](#))
3. Record a mark [3] for the height of the sensor mounting plate [2] of the upper limit sensor (PS109) [1].
4. Remove 2 screws [4], and attach them to the screw holes [5] provided outside. Then tighten them tentatively.
5. Adjust the sensor mounting plate [2] vertically while keeping it in a horizontal position, and tighten up the screw [4].

Note

- Be sure to install the sensor mounting plate [2] so that it is in a horizontal position.
 - Move downward the sensor mounting plate [2] to increase the paper feed height, and move upward the sensor mounting plate [2] to decrease the paper feed height.
 - When there occurs a no feed condition and a convex-curved paper is fed, move downward the sensor mounting plate [2] to increase the paper feed height.
 - When there occurs a double feed condition with the edge of fed paper folded and a concave-curved paper is fed, move upward the sensor mounting plate [2] to decrease the paper feed height.
6. Reinstall the above parts following the removal steps in reverse.

Note

- When turning on power with no paper feed roller unit installed, the paper lift plate does not stop at its upper limit position, thus causing damage to the tray.

13.7 Pick-up roller separation adjustment**(1) Usage**

Conduct this adjustment when there occurs a no feed jam repeatedly and when the paper feed height (upper limit) adjustment is made.

(2) Procedure

15ssf3c007na

1. Turn on the main power switch (SW1) and the sub power switch (SW2) of the main body. After the paper lift plate stops at its uppermost position (listen to the sound of the paper lift motor to figure out the stop status), turn off the both switches.
2. Remove the upper door [1]. (Refer to [G.6.2.2 Upper door](#))
3. Remove 6 screws [2] and remove the paper feed cover [3].

15ssf3c008na

4. With the moving part [2] of the pick-up solenoid (SD100) [1] pulled in the direction of the arrow, measure the gap [5] between the pick-up roller [3] and the paper lift plate [4].
Standard value: 0.5mm to 2.5mm
When not within the standard value, conduct an adjustment following Steps 5 and 6.
5. Loosen the screw [6]. And then using the marking-off lines [7] as a guide, adjust the position of SD100 [1] and tighten up the screw [6].
6. Reinstall the above parts following the removal steps in reverse.

Note

- After completion of installation, be sure to make a print and check to see if a no feed jam or double feed jam does not occur.

14. MECHANICAL ADJUSTMENT RU-509

14.1 Height adjustment

(1) Usage

Conduct this adjustment when there is any discrepancy in height and slant found between the main body and other optional devices.

(2) Procedure

[1]

1. Conduct the height adjustment by rotating the screw [1] at each of 4 positions. It goes up when rotating the screw [1] to the right, and goes down when rotating to the left.

Note

- Be sure to make adjustments while considering the height between other optional devices.

14.2 Position adjustment of the shutter solenoid (SD5)

(1) Usage

Conduct this adjustment when replacing the shutter solenoid (SD5) or C-1297 occurs.

(2) Procedure

1. Remove the upper cover. (Refer to [G.9.2.4 Upper cover](#))
2. Loosen 2 screws [2] of the shutter solenoid (SD5) [1].
3. Measure the gap A [5] between the solenoid installation plate [3] and the framework [4]. Adjust it so that it obtains the standard value, and then tighten the screw [2].
Standard value: A = 0mm to 0.5mm
4. After adjusting, Turn ON the main body to enter the service mode and select [State Confirmation]- [I/O Check Mode]. Conduct the output code 69-50 to check that there is no gap between the shutter [6] and the stopper [7].

15. MECHANICAL ADJUSTMENT RU-510

15.1 Height adjustment

(1) Usage

Conduct this adjustment when there is any discrepancy in height and slant found between the main body and other optional devices.

(2) Procedure

[1]

[1]

1. Remove the rear cover.(Refer to [G.10.2.3 Rear cover](#))
2. Loosen the 4 nuts of the caster [1] but not to be removed.
3. Adjust the height of 4 casters of RU-510 to equalize the upper and lower gaps.
It goes down when rotating the screw [1] in the arrow-marked direction, and goes up when rotating in the reverse direction.
4. Tighten the 4 loosened nuts [1].

16. MECHANICAL ADJUSTMENT ZU-608

16.1 Gate solenoid/Lw adjustment

16.1.1 Purpose

This adjustment must be made in the following case

- When the gate solenoid/Lw (SD601) is replaced with a new one.

16.1.2 Procedure

- Remove the front cover.

[G.11.2.5 Punch unit](#)

- Pull out the Z folding/conveyance unit.

- Loosen 2 screws [1] and then visually adjust so that the gate /Lw [2] maintains the standard value a relative to the guide plate [3]. Then, tighten the 2 screws [1].
Standard value: a = 3 mm to 5 mm
- Loosen 2 screws [4] and adjust the gate /Lw [2] so that the clearance between the gate /Lw [2] and the guide plate [3] gets to the standard value "b" while gate solenoid/Lw turns ON and the plunger [5] is pulled, and then tighten 2 screws [4].
Standard value: b = 2 mm to 4.6 mm

16.2 1st folding skew adjustment

16.2.1 Purpose

This adjustment must be made in the following case

- When the skew of the 1st folding is not within the standard value.

Note

- This adjustment affects the 1st Z-fold position. Be sure therefore to perform [Z-Fold Position Adjustment] of the service mode whenever this adjustment has been completed.

[I.5.13.54 ZU-608 Z-Folding Position Adjustment \(Z-Folding Unit Adjustment\)](#)

16.2.2 Procedure

- Remove the upper cover.

[G.11.2.3 Upper cover](#)

2. Perform the Z-folding printing operation on A3 or 11 x 17 paper and check to see if the skew of the 1st folding is within the standard value "a".
Standard value: a = 2 mm or less
When the value is not within the standard value, perform the following procedure.

3. Open the front door, and pull out the Z folding/conveyance unit.

4. Remove 4 screws [1], and remove the conveyance upper cover [2].

5. Loosen 4 screws [1].
6. Adjust the 1st stopper assembly [2] by moving the front side of the assembly to right and left by referring to the markings [3], and then tighten the 4 screws [1].
 - When the skew pattern is [4], move the front side of the 1st stopper assembly [2] to the left [5].
 - When the skew pattern is [6], move the front side of the 1st stopper assembly [2] to the right [7].
7. Replace the Z folding/conveyance unit, and then perform the Z-folding printing operation and check to see if the skew of the 1st folding is within the standard value.

8. Repeat steps 5 to 7 until the standard value can be obtained.

16.3 2nd folding skew adjustment

16.3.1 Purpose

This adjustment must be made in the following case

- When the skew of the 2nd folding is not within the standard value.

Note

- This adjustment affects the 2nd Z-fold position. Be sure therefore to perform [Z-Fold Position Adjustment] of the service mode whenever this adjustment has been completed.

[I.5.13.54 ZU-608 Z-Folding Position Adjustment \(Z-Folding Unit Adjustment\)](#)

16.3.2 Procedure

1. Perform the Z-folding printing operation on A3 or 11 x 17 paper and check to see if the skew of the 2nd folding is within the standard value "a".
Standard value: a = 2 mm or less
When the value is not within the standard value, perform the following procedure.

2. Open the front door, and pull out the Z folding/conveyance unit.

3. Loosen 4 screws [1].
4. Adjust the 2nd stopper assembly [3] by moving it vertically by referring to the markings [2], and then tighten the 4 screws [1].
 - When the skew pattern is [4], move the front side of the 2nd stopper assembly [3] to the left [5].
 - When the skew pattern is [6], move the back side of the 2nd stopper assembly [3] downward [7].
5. Replace the Z folding/conveyance unit, and then perform the Z-folding printing operation and check to see if the skew of the 2nd folding is within the standard value.

6. Repeat steps 5 to 7 until the standard value can be obtained.

16.4 2nd stopper position adjustment

16.4.1 Purpose

This adjustment must be made in the following case

- When the 2nd folding position cannot be adjusted from the service mode
- the skew of the 2nd folding cannot be adjusted.

Note

- This adjustment affects the 2nd Z-fold amount and 2nd Z-fold position. Be sure therefore to perform the following adjustment procedure whenever this adjustment has been completed.
 - 2nd folding skew adjustment
[1.16.3 2nd folding skew adjustment](#)
 - [Z-Fold Position Adjustment] of the service mode
[1.5.13.54 ZU-608 Z-Folding Position Adjustment \(Z-Folding Unit Adjustment\)](#)

16.4.2 Procedure

1. Conduct the Z-folding printing operation to move the 2nd stopper [1] to the home position, and then turn OFF the main power switch of the main body.
2. Open the front door, and pull out the Z folding/conveyance unit.
3. Check to see if the distance between the 2nd stopper [1] and inside edge of the guide plate [2] is within a standard value.
Standard value: $a = 20 \pm 0.5 \text{ mm}$
4. When the value is not within the standard value, perform the following procedure.
5. Loosen 2 screws [3] with the hex wrench, and then adjust the distance between the 2nd stopper [1] and the inside of the guide plate [2] so that it gets to the standard value a .

Note

- Be sure not to rotate the actuator [5] of the 2nd stopper home sensor [4] during the adjustment. It may be moved from the home position.
- Conduct the following steps 6 to 14 only if you cannot reach to the screws [3] with the hex wrench when they are located in side of the 2nd stopper assembly.

6. Rotate the shaft [2] so that you can reach to 2 screws [1] with the hex wrench.
7. Loosen 2 screws [1].
8. Rotate the shaft [2] so that the actuator [3] is roughly positioned to the home position [5] of the 2nd stopper home sensor [4].

Note

- **Never remove the screw [6] from the actuator [3].**
- **At the appropriate position, the anti-rotation pin [7] points upward when the actuator [3] faces to the left.**

9. Rotate the pulley [8] to move the 2nd stopper [9] to the position within the standard value.
10. Loosen 4 screws [10].
11. Lift up the shaft [12] upward enough to remove the belt [11] from the pulley [8], and then rotate the pulley [8] without moving the shaft [2] and the 2nd stopper [9] so that the screw [1] faces outside.
12. Tighten the 2 screws [1].
13. Tighten 4 screws [10].

Note

- **Before tightening the screws [10], be sure to check the tension is exerted on 2 belts [11].**

14. Repeat the steps 3 to 5 to adjust the 2nd stopper to the position within the standard value.

17. MECHANICAL ADJUSTMENT FS-532

17.1 Staple position adjustment

17.1.1 Usage

Change the setting when changing the staple position

17.1.2 Procedure

1. The parallel staple position of FS-532 [1] is adjustable between 5.5 mm to 9.5 mm.
2. By adjusting the position of the parallel staple, the position of the corner staple is also changed as follows.
[2]: 6.7mm to 9.5mm
[3]: 12.4mm to 15.2mm

3. Remove 2 screws [1] and then remove the wiring mounting cover [2].

4. Remove the screw [1].
5. If the screw [2] is tightened, the stapler unit assy [3] moves in the arrow-marked direction [4] (the moving distance increases). If the screw [2] is loosened, the unit moves in the arrow-marked direction [5] (the moving distance decreases).

Note

- Be careful that the stapler unit assy [3] is possible to change the shape if the screw [2] is turned without the screw [1] being removed.

6. Adjust the position of the parallel staple by moving up and down the stapler unit assy [3] by referring to the division [6] of the mark. Marked at 1 step = 1mm interval.
7. Reinstall the preceding parts following the removal steps in reverse.

17.2 Main tray horizontal adjustment

17.2.1 Purpose

When the heights of the main tray differs between the front and rear, conduct this adjustment.

17.2.2 Procedure

⚠ Note

- After having lowered the main tray, be sure to unplug the power plug from the power outlet.

1. Turn ON the sub power switch (SW2), block the light of the tray upper limit sensor (PS16) [2] during up and down operation of the main tray [1], and lower the main tray to the position where the main tray does not interfere the removing of the output cover /Fr2 [3].
2. Turn OFF the sub power switch (SW2) and main power switch (SW1) of the main body.
3. Unplug the power plug of the main body from the power outlet.
4. Remove the screw [4] and remove the main tray cover /Fr [5].
5. Remove 2 screws [6] and remove the paper exit cover /Fr3 [7].
6. Remove 3 screws [8] and remove the paper exit cover /Fr2 [3].
7. Remove 5 screws [9] and remove the paper exit cover /Fr1 [10].

8. Remove 2 screws [1], remove the belt stopper [2] and adjust the position of the belt [3].
9. Reinstall the preceding parts following the removal steps in reverse.

18. MECHANICAL ADJUSTMENT SD-510

18.1 Adjustment for Staple Clinch Failure

18.1.1 Usage

When there is a problem in clinching of the stapler.

Note

- Be careful not to let FS fall down when removing FS from the main body and pulling out the stacker unit from FS. It may cause the injury.

18.1.2 Procedure

1. Make a copy in the staple mode.

2. Check there is failures in clinching staples as described below.
 - There is the bucking [1] of the staple.
 - The floating [2] of the staple is within the standard value (L = 1 mm)
 - The bending height [3] of the staple is within the standard value (L = 0.5 mm)

3. If clinching performance is out of the above specifications, make the following adjustment.
4. Remove the SD unit. (Refer to [G.13.3.4 SD unit](#))
5. Remove the clincher cover. (Refer to [F.15.2.1 Replacing the stapler unit](#))
6. Loosen 2 screws [2] of the clincher[1].

Note

- Make sure that 2 injections [3] of the clincher do not come off from 2 slotted holes [4].
- Be careful that the staple adjustment jig [6] cannot be inserted if the 2 screws [2] are too loose.

7. Insert the staple adjustment jig [6] between the stapler unit [5] and the clincher [1], and adjust the horizontal position of the clincher [1].

Note

- When inserting the staple adjustment jig [6], be sure to insert it from obliquely above as indicated by the allow mark [7].

8. Loosen 2 screws [2] to fasten the clincher [1].
9. Pull out the staple adjustment jig [6].

18.2 1st folding skew adjustment

18.2.1 Usage

Conduct this adjustment when the skew of the 1st folding is not within the standard value.

Note

- This adjustment affects the 1st Z-fold position. Thus, be sure to perform the following adjustment in the service mode after the adjustment has been completed.

[I.5.13.8 SD-510 Fold&Staple Staple Position Adjustment \(staple finisher \(fold\) adjustment\)](#)

[I.5.13.9 SD-510 Fold&Staple Fold Position Adjustment \(staple finisher \(fold\) adjustment\)](#)

[I.5.13.10 SD-510 Half-Fold Fold Position Adjustment \(staple finisher \(fold\) adjustment\)](#)

[I.5.13.11 SD-510 Tri-Fold Position Adjustment \(staple finisher \(fold\) adjustment\)](#)

18.2.2 Procedure

1. Half-fold a sheet of A3 paper, measure the width "a" and "b" of the paper while keeping the paper exit direction [1], and confirm that the folding width "c" is within the standard value.
Standard value: a-b = c = ±2mm or less
When the value is not within the standard value, perform the following procedure.

2. Pull out the SD unit.
3. Loosen 2 screws [1].

Note

- Be careful that the position of the rear stopper [2] could change in the middle of the adjustment if 2 screws [1] are loosened excessively.

4. Lift the paper exit guide [3] and place the scale or something [4] on the rear stopper [2], and then slide the rear stopper [2] so that the marking-off line [5] and the scale [4] come to the same position.

Note

- Be sure to slide the rear stopper [2] with the belt [6].

5. Change the tilt of the stopper [3] so that both edges of the scale [1] and the marking-off line [2] come to the same position.
6. Use the belt [4] to slide the stopper [3] to the former position.

Note

- Be sure to slide the rear stopper [3] with the belt [4].

7. Tighten 2 screws [1].
8. Slide the rear stopper [2] again and confirm that both edges of the scale [3] and the marking-off line [4] are at the same position.
9. Repeat the steps 3 to 7 so that both edges of the scale and the marking-off line come to the same position.

19. MECHANICAL ADJUSTMENT PK-522

19.1 Punch hole position skew adjustment

19.1.1 Usage

Conduct this adjustment if the edge of the paper and the punch hole position of the paper fed from PI is not in parallel.

19.1.2 Procedure

15kij3c001na

1. Check the tilt by using the platen copy or Service Mode after aligning paper in the main body paper feed tray with the side guide plate and the rear guide plate.
2. Conduct the paper skew adjustment when too much tilt is checked.
3. As a sample for checking the tilt of the punch hole position, conduct 3 sheets of punch mode printing for each simplex mode and duplex mode.
4. Measure the punch hole positions on 3 sheets of printed paper to check the tilt.
Tilt of the punch hole position (%) = $(A-B)/C$

5. Open the front door of FS.
6. Remove 3 screws [1] and then remove the punch unit cover [2].

7. Loosen 6 adjustment screws [1] of PK.
8. Based on the division [2] of the mark, move the punch unit [3] to the right and left only for the tilt amount of the punch hole position.
1 division : 0.5%
9. Tighten 6 adjustment screws [1].
10. Repeat step 3 to 9 until the tilt of the punch holes is corrected.
11. Install the punch unit cover.

19.2 Punch unit adjustment mounting position adjustment

19.2.1 Usage

This adjustment is conducted when the installation location of FS-532 is changed.

19.2.2 Procedure

1. Open the front door of the FS, and remove the punch unit cover (Refer to [1.19.1 Punch hole position skew adjustment](#))
2. Loosen 2 screws [1] so that the pad section [3] of the punch unit adjustment plate [2] slightly touches the oscillating plate [4] of the punch unit.

Note

- When letting the pad section [3] slightly touch, be sure to adjust the position of the punch unit adjustment plate [2] and the oscillating plate [4] so that they are parallel [5] to each other.

3. Check the positional relationship between the marking-off line (rear side) [2] of the punch unit adjustment plate [1] and the side edge of the metal frame [3], and between the marking-off line (front side) [4] of the punch unit adjustment plate and the projection [5].
4. Push the punch unit adjustment plate [1] in the arrow-marked direction and move the marking-off line at both front and rear sides by 3 divides of the scale from the position where the pad section slightly touches. Then, tighten 2 screws[6].

Note

- When the adjustment plate is pushed by 3 divides of the scale, it is possible that the side edge of the metal frame [3] could go beyond the left edge of the marking-off line (rear side) [2] or that the projection [5] could contact with the adjustment plate [1]. In this case, there are likely troubles with the installation position of the FS and the installation method of the PK, so be sure to check them again.

20. MECHANICAL ADJUSTMENT PI-502

20.1 PK punch position centering adjustment

20.1.1 Usage

This adjustment is conducted when the punch position of the paper from the PI is misaligned in the vertical direction.

20.1.2 Adjustment procedure for the cover sheet tray /Up

15knf3c002nb

1. Output the test pattern No.16, and set the paper on the cover sheet tray /Up of the PI.
2. Process the paper in the punch mode, and check the misalignment "a" between the center of the paper [1] and the center of the punch holes [2].

3. Release the hook [1] and remove the cover of the side guide /Fr or /Rr [2].

4. Loosen 2 screws [1] of the side guide /Fr or /Rr, and slide the side guide in the opposite direction to the shift direction twice as far as the misalignment "a".
Example: If the punch position is shifted 1.5mm backward, the side guide /Fr or /Rr must be slid 3mm forward.
[2]: 1 division = 2mm

5. Tighten 2 screws [1], and fix the side guide /Fr or /Rr.

Note

- Be sure not to tighten 2 screws [2] too much.

6. Set the paper on the cover sheet tray /Up, and make sure that the side guide /Fr or /Rr is mounted parallel to the paper.
7. Process the paper in the punch mode, and repeat the steps 1 to 6 until the misalignment of the punch hole position is improved.
8. Set the A4S paper on the cover sheet tray /Up, and conduct the "Tray Size Adjustment" ("Stapler (PI) Adjustment") in the service mode. (Refer to [I.5.13.18 PI-502 Tray Size Adjustment \(staple finisher \(PI\) adjustment\)](#))
9. Reinstall the preceding parts following the removal steps in reverse.

20.1.3 Adjustment procedure for the cover sheet tray /Lw

15knf3c002nb

1. Output the test pattern (No.16), and set the paper on the cover sheet tray /Lw of the PI.
2. Process the paper in the punch mode, and check the misalignment "a" between the center of the paper [1] and the center of the punch holes [2].

3. Release the hook [1] and remove the cover of the side guide /Fr or /Rr [2].

4. Remove 2 screws [1], and dismount the side guide /Fr or /Rr [2].

5. Loosen 2 screws [2] of the side guide /Fr or /Rr [1], and slide the side guide in the opposite direction to the shift direction twice as far as the misalignment "a".
Example: If the punch position is shifted 1.5mm backward, the side guide /Fr or /Rr [1] must be slid 3mm forward.

6. Tighten 2 screws [2], and fix the side guide /Fr or /Rr.

Note

- Be sure not to tighten 2 screws [2] too much.

7. Mount the side guide /Fr or /Rr with 2 screws [1].

Note

- Be sure not to tighten 2 screws [2] too much.

8. Set the paper on the cover sheet tray /Up, and make sure that the side guide /Fr or /Rr is mounted parallel to the paper.
9. Process the paper in the punch mode, and repeat the steps 1 to 6 until the misalignment of the punch hole position is improved.
10. Set the A4S paper on the cover sheet tray /Lw, and conduct the "Tray Size Adjustment" ("Stapler (PI) Adjustment") in the service mode. (Refer to [I.5.13.18 PI-502 Tray Size Adjustment \(staple finisher \(PI\) adjustment\)](#))
11. Reinstall the preceding parts following the removal steps in reverse.

21. MECHANICAL ADJUSTMENT LS-505

21.1 Adjusting the paper press solenoid /1 (SD6)

(1) Usage

Conduct this adjustment when uneven stack occurs.

Note

- Before starting this operation, be sure to bring the stacker tray down to the bottom in advance.

(2) Procedure

- With the paper press solenoid /1 (SD6) turned on by hand, check to see if the A section in the drawing left is 1.5mm to 3mm.

- When not in the range of adjustment, remove the spring, loosen the fixing screw of the paper press solenoid /1 (SD6), and make adjustment by moving it from side to side so that the range of the SD stroke becomes $6 \pm 0.5\text{mm}$.

21.2 Adjusting the paper press solenoid /2 (SD7)

(1) Usage

Conduct this adjustment when uneven stack occurs with the B4 or larger paper.

(2) Procedure

- With the paper press solenoid /2 (SD7) turned OFF by hand, check to see if the A section in the drawing left is $66 \pm 2\text{mm}$.

- When not in the range of adjustment, loosen the fixing screw of the paper press solenoid /2 (SD7) and make adjustments by sliding it up and down.

21.3 Adjusting the paper press solenoid /3 (SD8)

(1) Usage

Conduct this adjustment when uneven stack occurs.

(2) Procedure

ls502fs3006c

1. With the paper press solenoid /3 (SD8) turned OFF by hand, check to see if the A section in the drawing left is $50.1 \pm 1\text{mm}$.

ls502fs3007c

2. When not in the range of adjustment, loosen the fixing screw of the paper press solenoid /3 (SD8) and make adjustments by sliding it from side to side.

21.4 Adjusting the job partition solenoid (SD2)**(1) Usage**

Conduct this adjustment when uneven stack occurs with the shift paper and non-shift paper in the sort mode.

(2) Procedure

ls502to3009c

1. With the job partition solenoid (SD2) turned ON by hand, check to see if the job partition blade [1] in the drawing left does not protrude from the metal frame [2].

ls502fs3008c

2. When not in the range of adjustment, loosen the fixing screw of the job partition solenoid (SD2) and make adjustments by sliding it from side to side.

21.5 Horizontal adjustment**(1) Usage**

Adjustments are made when there is any discrepancy in height and slant found between the main body and other optional devices.

(2) Procedure

1. Conduct the horizontal adjustment by inserting the driver to the holes [2] and [3] on each of 4 ratchet material [1] and moving it back and forth. It goes up with the hole [2] and goes down with the hole [3].

Note

- Be sure to make adjustments while considering the height between the main body and other optional devices.
- Be sure not to go it up too much, otherwise the bolt comes off. (max. $\pm 5\text{mm}$)
- Be sure that the caster is contacting installation surface, otherwise the ratchet does not work. In this case, adjust the casters which are on the ground first to get the casters spinning to be on the ground.

21.6 Grip conveyance home sensor adjustment**(1) Usage**

Conduct this adjustment when the grip standby position on the grip belt is improper to receive the paper or when the shift unit drive abnormality occurs.

Note

- When the shift unit drive abnormality (C-1204: 1st tandem, C-1214: 2nd tandem) occurs after replacing the LS control board (LSCB), conduct the following adjustment.

(2) Procedure

[1]

[2]
ls502fs3010c

1. Turn ON the power of the main body.
2. Move the grip belt by hand and stop it at the position in which the leading edge of the grip [1] is about 4mm from the stack exit guide plate [2].
a: approx. 4mm

[1]

ls502fs3011c

3. Rotate VR1 [1] on the LS control board (LSCB) fully to the left.

[2]

[1]

ls502fs3012c

4. Rotate VR1 [1] to the right and stop it at the position in which LED2 [2] turns ON from flashing.

Note

- When LED2 is rotated too much from the turn-on position to the flashing position, repeat the procedure starting at Step2.

5. After completion of adjustment, turn off and on the power of the main body and check if the interval "a" between the edge of the grip and the stack exit guide plate is $8 \pm 2\text{mm}$.
6. When the interval is not within the standard value, change the position of the sensor mounting plate [1]. Loosen 2 screws [2] and slide the sensor mounting plate to the right [3] to widen the interval "a". Slide the plate to the left [4] to narrow the interval.

22. MECHANICAL ADJUSTMENT FD-503

22.1 Roller solenoids /1 (SD5), /2 (SD6), /3 (SD7) and /4 (SD8) position adjustment

(1) Usage

When the roller solenoids /1 (SD5), /2 (SD6), /3 (SD7), /4 (SD8) are changed, be sure to conduct this adjustment.

Note

- The following adjustment steps show the steps for the roller solenoid /2 (SD6). The steps for the roller solenoids /1 (SD5), /3 (SD7) and /4 (SD8), are the same as the steps for the roller solenoid /2.

(2) Procedure

- Loosen 2 screws [2] of the roller solenoid /2 (SD6) [1].
- Measure the distance A [5] between the end face of the vertical conveyance roller /Lt [3] and the right side (the opposite of the paper through side) of the guide plate [4] when the roller solenoid /2 (SD6) [1] is turned ON, and then tighten the screw [2] after adjusting the distance so that it becomes the standard value. Standard value: A = 0mm to 1.5mm

22.2 2nd folding roller solenoid (SD18) position adjustment

(1) Usage

Conduct this adjustment when replacing the 2nd folding roller solenoid (SD18).

(2) Procedure

1. Loosen 3 screws [2] on the 2nd folding roller solenoid mounting plate [1].
2. Measure the gap A which the vertical conveyance roller /Lt [4] is out from the guide plate [5] when the 2nd folding roller solenoid (SD18) [3] is ON.
3. Adjust the mounting position so that the gap A is within the standard value shown in the following table, and then loosen 3 screws [2].
Standard value: A = 4mm to 5mm

22.3 Punch Centering Adjustment**(1) Usage**

When the front to rear position of the punch holes cannot be adjusted up to the specification in the paper width adjustment, be sure to conduct this adjustment. (Refer to [1.5.13.20 FD-503 Paper Width Adjustment \(Multi Folder\(Punch\) Adj.\)](#))

(2) Procedure

1. Disconnect the connector [1] and 4 screws [2], and then remove the cord support board /A [3].

2. With the alignment plate /Fr [1] and the alignment plate /Rr [2] moved to the center, loosen the 2 screws [3].
3. Measure the distances A and B using a ruler and adjust the positions of the alignment plate /Fr [1] and the alignment plate /Rr [2] so that the distances A and B become equal, and then tighten 2 screws [3].
4. Reinstall the above parts following the removal steps in reverse.

22.4 Horizontal adjustment

(1) Usage

Conduct this adjustment when there is any discrepancy in height and slant found between the main body and other optional devices.

(2) Procedure

a0h0f3c001ca

1. Conduct the horizontal adjustment by inserting the driver to the holes [2] and [3] on each of 4 ratchet material [1] and moving it back and forth. It goes up with the hole [2] and goes down with the hole [3].

Note

- Be sure to make adjustments while considerate the height between the main body and other optional devices.
- Be sure not to go it up too much, otherwise the bolt comes off. (max. $\pm 5\text{mm}$)
- Be sure that the caster is contacting installation surface, otherwise the ratchet does not work. In this case, adjust the casters which are on the ground first to get the casters spinning to be on the ground.

22.5 Paper feed control gear position adjustment (PI tray)

(1) Usage

Conduct this adjustment when the paper size detection of PI does not work properly.

(2) Procedure

fd501fs3008c

1. Install the regulation plate rack A [1] and the regulation rack B [2] so that they are aligned with the reference hole of the detection gear [3].

fd501fs3009c

fd501fs3010c

2. Check the paper size VR [2] to ensure it is held by the 2 bosses on the paper size VR mounting plate [1].
3. Install the paper size VR [2] so that the notch of its center hole is set to the notch of the detection gear [3].

4. Check to see if the regulation plate rack A [1], the regulation plate rack B [2], the hole position of the detection gear [3] and the notch position of the paper size VR [4] are in the correct position respectively.

22.6 Paper feed pick-up volume adjustment (PI tray)

(1) Usage

Perform this adjustment when multi-feed or paper jam occurs when feeding paper from the PI.

(2) Procedure

fd501fs3011c

1. Slide 2 papers feed arm fixing levers [1] to inside, and insert the shafts [2] into the holes [3] in the paper feed arm to secure the paper feed arm [4].

23. MECHANICAL ADJUSTMENT SD-506

23.1 Horizontal adjustment

(1) Usage

Conduct this adjustment when SD is not in a horizontal position.

(2) Procedure

1. Conduct the horizontal adjustment by inserting the driver to the holes [2] and [3] on each of 6 ratchet material [1] and moving it back and forth. It goes up with the hole [2] and goes down with the hole [3].

Note

- Be sure to make adjustments while considering the height between the main body and other optional devices.
- Be sure not to go it up too much, otherwise the bolt comes off. (max. $\pm 5\text{mm}$)
- Be sure that the caster is contacting installation surface, otherwise the ratchet does not work. In this case, adjust the casters which are on the ground first to get the casters spinning to be on the ground.

23.2 Folding skew adjustment

(1) Usage

Adjust the skew in the center folding.

(2) Procedure

1. Perform the center folding operation for 5 sheets of A3 or 11 x 17 paper and check their skew "a".
Standard value $a = \pm 1.5\text{mm}$
When the value is not within the standard value, perform the following procedure.

2. Open the front door /Rt and pull out the folding unit.
3. Loosen the screw [1], adjust the alignment stopper /Rr2 [3] back and forth by sliding the adjusting bracket [2] to right and left, and tighten the screw [1].

Note

- If the folding pattern on paper exited to the direction of bundle exit tray front side [4] is [5], slide the adjusting bracket [2] in the arrowed direction [6].
- If the folding pattern is [7], slide the adjusting bracket [2] in the arrowed direction [8].
- By sliding the adjusting bracket [2] to 1mm right and left, the alignment stopper /Rr2 [3] moves 1/3mm back and forth.

4. Return the folding unit to the original position and repeat the steps 1 through 3 until the standard value can be obtained.

23.3 Second folding position stabilization adjustment**(1) Usage**

This adjustment is for adjusting the misalignment of the second folding position in tri-folding.

Note

- This adjustment is to adjust the variation per each folding. Adjust the second folding position by following "[1.5.13.36 SD-506 Tri-Fold Position Adj. \(Saddle Stitcher Pos. Adj.\)](#)".
- Be sure that the adjusting position is vary from the number of folding sheets.

(2) Procedure

1. Conduct the tri-folding with A4S or 8 1/2 x 11S, and check if the interval "A" between the first folding and the second folding is within the standard value.
Standard value A = 102.0mm ± 3mm (A4S)
Standard value A = 96.1mm ± 3mm (8 1/2 x 11S)
When the value is not within the standard value, perform the following procedure.

2. Open the front door /Rt and pull out the folding unit.
3. Loosen 2 screws [1] and move the stopper [2] in parallel back and forth referring to the mark [3].

Note

- Moving to the front side [4] makes the length between the foldings longer.
- Moving to the back side [5] makes the length between the foldings shorter.

4. Repeat steps 1 to 3 until the standard value is obtained.

23.4 Staple position adjustment

(1) Usage

Adjust the misalignment between the staple position and the folding position.

(2) Procedure

1. Perform the saddle stitching operation for 25 to 30 sheets of A3 or 11 x 17 paper and check the misalignment "a" between the staple position and the folding position.

Standard value $a = \pm 1\text{mm}$

When the value is not within the standard value, conduct "(2).

Adjustment Procedure /1" then "(3). Adjustment Procedure /2" in this order.

(3) Adjustment Procedure /1

Note

- Be sure not to adjust over the allowable value since only the saddle stitching hold /Up is adjusted but the saddle stitching hold /Lw is not.
- When it cannot be adjusted by this simple adjustment (fine adjustment), be sure to conduct "(3). Adjustment Procedure /2".

1. Open the front door /Lt.
2. Install the M4 screw [1] obtained from the exterior and so on into the adjustment screw hole [3] of the saddle stitching hold /Up [2] with your fingers and tighten it slightly until it is contacted.

Note

- Do not tighten the screw [1] too tight. Stop tightening when it is contacted.

3. Loosen the screw [4].
4. Rotate the screw [1] to move the position of the saddle stitching hold /Up [2] on both of the stapler /Rt and /Lt for the length of the misalignment "a".

Note

- Rotating the screw [1] 1 revolution moves the saddle stitching hold /Up 0.7mm (same width with staple).
- When the screw [1] is tightened, the staple position moves forward. When the screw [1] is loosened, the staple position moves backward.

5. While pushing the saddle stitching hold /Up [2] to the allowed direction [5] and contacting it to the screw [1], tighten the screw [4].
6. Remove the screw [1] and return it to the original position.
7. Conduct a test print in procedure A, and repeat steps 2 to 6 until the standard value is obtained.

(4) Adjustment Procedure /2

1. Pull out the saddle stitching unit.
(Refer to [F.19.3.3 Pulling out the saddle stitching unit](#))
2. Rotate the screw [1] clockwise until clicked to make the clinchers [2] contact with the staplers and lock the clinchers [2].

3. Install the M4 screw [1] obtained from the exterior and so on into the adjustment screw hole [3] of the saddle stitching hold /Up [2] with your fingers and tighten it slightly until it is contacted.

Note

- Do not tighten the screw [1] too tight. Stop tightening when it is contacted.

4. Loosen the screws [4], [5] and [6].
5. Rotate the screw [1] to move the position of the saddle stitching hold /Up [2] for the length of the misalignment "a".

Note

- Rotating the screw [1] 1 revolution moves the saddle stitching hold /Up 0.7mm (same width with staple).
- When the screw [1] is tightened, the staple position moves forward. When the screw [1] is loosened, the staple position moves backward.

6. While pushing the mounting plate [7] to the arrow-marked direction [9] and contacting the saddle stitching hold /Up [2] to the screw [1], tighten the screws [5].
7. While pushing the saddle stitching hold /Up [2] to the arrow-marked direction [10] and contacting the saddle stitching hold /Up to the screw [1], tighten the screw [4], and then tighten the screw [6].
8. Remove the screw [1] and return it to the original position.
9. Return the saddle stitching unit, and then repeat steps 2 to 8 until the standard value can be obtained.

23.5 Stapler position adjustment**(1) Usage**

Conduct this adjustment when a broken staple, a bent staple, or a defective staple occurs in stapling.
This adjustment adjusts the phase lag with the clincher at front and rear.

(2) Procedure

1. Carry out stapling operation to check that the broken staple, the bent staple, or the defective staple does not occur. If the defective occurs, conduct the following procedure.
2. Open the front door /Lt.
3. Install the M3 screw about 20mm long [3] into the adjustment screw hole [2] of the stapler mounting bracket [1] with fingers and tighten it slightly until it is contacted to the supporting bracket [4].

Note

- Do not tighten the screw [3] too tight. Stop tightening when it is contacted.

4. Loosen a screw [5].
5. Rotate the screw [3] and move the anteroposterior position of the stapler to adjust the phase lag with the clincher.

Note

- Rotating the screw [3] 1 revolution moves the stapler 0.5mm.
- When the screw [3] is tightened, the staple position moves forward. When the screw [3] is loosened, the staple position moves backward.

6. While pushing the stapler mounting bracket [1] to the back side [6] and contacting the screw [3] to the supporting bracket [4], tighten the screw [5].
7. Remove the screw [3].

8. Repeat steps 1 to 7 until the defective staple does not occur.

23.6 Tilt/gap adjustment of the clincher

(1) Usage

Perform this adjustment when the staple break through the paper by stapling a few pages of booklet.

(2) Procedure

1. Carry out stapling operation with 2 sheets of papers, and check if the staple break through the paper. If the paper is broken through, perform the following steps.
2. Pull out the saddle stitching unit.
(Refer to [F.19.3.3 Pulling out the saddle stitching unit](#))
3. Tilt the bundle arm [1] to the front.
4. Remove the staple cartridges [2] to the front.
5. Rotate the stapler move gear [3] to move the stapler assy inward, then move them outward by approx. 30mm (the interval between the stapler becomes approx. 60mm).

Note

- Rotate the stapler move gear [3] to move the stapler assy inward, then move them outward by approx. 30mm (the interval between the stapler becomes approx. 60mm).

6. Remove the screw [1] and remove the sensor cover [2].

7. Disconnect the connector [1].

Note

- When reinstalling the saddle stitching unit, be careful not to let the connector [1] make contact with the main body.

8. Remove 3 screws [2], and then remove the saddle stitching guide plate [3].

15anf3c012ca

[1]

[2] [3]

15anf3c013ca

9. Rotate the screw [1] clockwise until clicked to make the clinchers [2] contact with the staplers [3] and lock the clinchers [2]. At the moment the clinchers are locked, check if the clinchers do not roll from side to side and the gap between the staplers and the clinchers equals to the standard value.

Standard value "a": $0.3 \pm 0.1\text{mm}$ (2 sheets of 64g/m^2 papers can pass through the gap while 3 sheets cannot.)

10. When the gap is out of the standard value, loosen the screw [1] counterclockwise and lower the clinchers once. Then perform the adjustment the following procedure.

11. Loose the 4 screws [1].

12. Adjust the gap between the staplers and the clinchers so that the gap equals the standard value while loosening (gap becomes narrower) /tightening (gap becomes wider) the adjusting screw/Rt [2] and /Lt [3] in the same manner.

Note

- Be sure to perform the adjustment for both left and right side of each clincher/Rt [4] and /Lt [5] so that the stapler and the clinchers are parallel to each other.
- When the adjustment is completed, be sure to tighten the fixing screws [1].

13. Put the saddle stitching unit back. Then carry out stapling operation with 2 sheets of papers, and check if the staple does not break through the paper.

23.7 Roller cutter skew adjustment

(1) Usage

Adjust the skew when it occurs at trimming.

(2) Procedure

a0h2f3c008ca

a0h2f3c009ca

a0h2f3c010ca

1. Check the trimming parallelism by trimming center folded or senter stitched paper if it is within the standard value.
Standard value:
"a" = 1.0mm or less (2 to 15 sheets)
"a" = 1.5mm or less (16 to 50 sheets)
When the value is not within the standard value, perform the following procedure.

Note

- Remove the staple to check it for 2 sheets to 15 sheets.

2. Open the front door /Lt.
3. Loosen the screw [2] of the registration claw.
4. Turn the gear flange [4] with holding the shaft [3], adjust the registration claw /Rt [1] back and forth, and then tighten the screw [2].

5. Check point for the adjustment

Note

- Move the registration claw /Rt to the front side in case the skew is [2] to the paper exit direction [1], or move the claw to the rear side in case the skew is [3].

6. Repeat steps 1 to 5 until the standard value is obtained.

23.8 Trimming adjustment**(1) Usage**

Adjust the gap when a large gap occurs at trimming thick books.

Note

- This adjustment is effective for the thick book more than 30 pages.

(2) Procedure

a0h2f3c011ca

a0h2f3c012ca

1. Check the trimming gap "a" by trimming the center folded or senter stitched book which has 31 pages or more. Conduct the following steps if the gap is large.

Note

- There is no standard value of trimming gap for 31 pages or more. Refer to the standard value for 16 pages to 30 pages, which is 1.5mm.

2. Open the front door /Lt.
3. Remove the slope unit. (Refer to [F.19.3.2 Replacing the slope unit](#))
4. Loosen the 2 screws [2] each of the registration claw /Rt and /Lt [1], move the fold retaining bracket [3] down to the bottom, and then tighten the screws [2].
5. Repeat steps 1 to 4 until the allowable value can be obtained.

24. MECHANICAL ADJUSTMENT PB-503

24.1 Clamp sub scan direction alignment adjustment

(1) Usage

Carry out the adjustment when the following conditions occur.

The fore edges near the top or the bottom of the book do not line up perfectly.

The pages come off from the cover paper near the top or the bottom of the book due to insufficient gluing to the spine of inside papers.

An improper gap between the reference plate and the sub scan alignment plate causes misalignment of the pages in the sub scan direction.

To correct the misalignment, perform "Clamp FD Position Adj. (Perfect Binder Adjustment)" in Service Mode → Finisher Adjustment → Perfect Binding Machine Adjustment.

(2) Procedure

1. Remove the SC cover/Fr. (Refer to [G.19.2.11 SC cover /Fr](#))
2. Loosen a screw [1].
3. Adjust the position of the sub scan alignment plate by moving the clamp entrance assy [2] in the direction of the arrow [4] or [5] to change the installation position of the clamp entrance assy against the coupling bracket [3].

Note

- Be sure to hold down the coupling bracket [3] when moving the clamp entrance assy, as the assy is heavy and hard to move.
 - [6] shows the book exit direction;
 - a. A misalignment occurs near the bottom side (front side when inside paper alignment is performed)
[7]: Move the clamp entrance assy [2] in the direction of the arrow [4] to make the gap at the front side narrower.
 - b. A misalignment occurs near the top side (back side when inside paper alignment is performed)
[8]: Move the clamp entrance assy [2] in the direction of the arrow [5] to make the gap at the front side wider.
 - When moving the clamp entrance assy [2] in the direction of the arrow [5], the misalignment of the inside papers occurs at both the top and bottom sides. To correct the misalignment, perform "Clamp FD Position Adj. (Perfect Binder Adjustment)" in Service Mode → Finisher Adjustment → Perfect Binding Machine Adjustment after performing this adjustment.
4. After performing the adjustment, make a test print and binding to check that the inside papers are perfectly lined up in the sub scan direction.
 5. Reinstall the preceding parts following the removal steps in reverse.

24.2 Clamp main scan direction alignment adjustment

(1) Usage

Carry out the adjustment when the following conditions occur.

The top and bottom edges of inside papers do not line up and it cannot be corrected even after performing "Clamp section CD alignment width adjustment" and "SC section CD alignment width adjustment" in the service mode.

The cover and the inside papers are not aligned.

Note

- The misalignment of cover and inside papers can also be adjusted in "[I.24.10 Cover paper alignment plate adjustment](#)" and "[I.24.12 Cover paper table positioning](#)".

(2) Procedure

1. Pull out the clamp unit.
 2. Move the clamp alignment plates /Fr [1] and /Rr [2] inward as far as they go [3].
- Note**
- Be sure to hold both clamp alignment plates/Fr [1] and /Rr [2], and move them slowly to maintain the proper engagement of the belt and the pulleys.
3. Loosen 2 screws [4] and adjust the position of the clamp alignment plates/Fr [1] and /Rr [2] by moving them back and forth.
- Note**
- [5] shows the book exit direction;
 - a. When top edge of cover paper runs off that of inside papers [6]: Move the clamp alignment plates/Fr [1] and /Rr [2] backward by the same distance.
 - b. When bottom edge of cover paper runs off that of inside papers [7]: Move the clamp alignment plates/Fr [1] and /Rr [2] forward by the same distance.
 - When moving 2 clamp alignment plates in the same direction, always move them by the same distance.
4. After performing the adjustment, make a test print and binding to check that the top and bottom edges of inside papers are perfectly lined up and the cover edges neatly align with edges of inside papers.
 5. Reinstall the above parts following the removal steps in reverse.

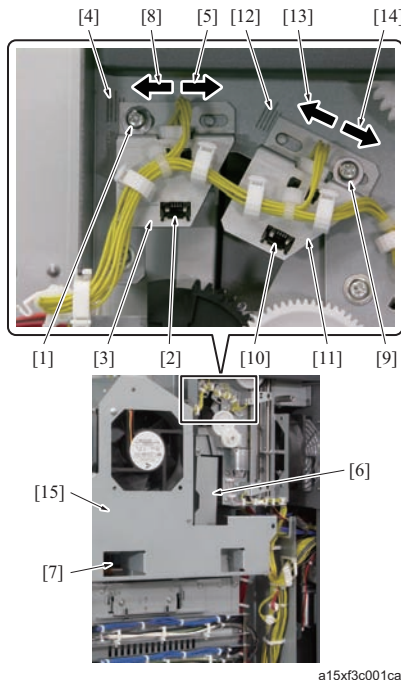

24.3 Pellet supply arm angle adjustment**(1) Usage**

Carry out the adjustment when the following conditions occur.

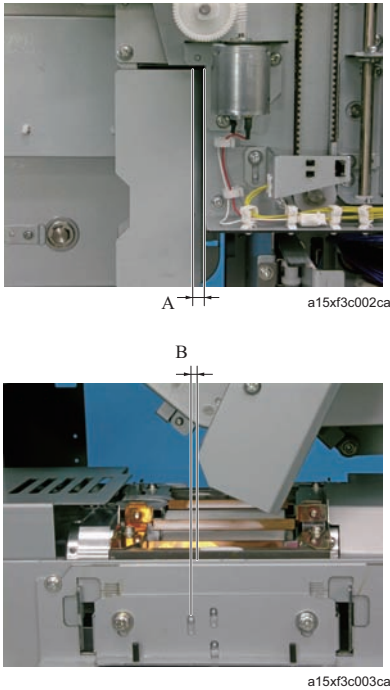

- The pellet is supplied to the tank improperly and it spills out of the tank.
- The pellet supply arm contacts with the other parts when the arm is in its home position.

Note

- Be sure to turn Off the power switch (SW2) and the main power switch (SW1) of the main body in advance.

(2) Procedure

1. Remove the rear cover /Rt.
(Refer to [G.19.2.5 Rear cover /Rt](#))
 2. Loosen a screw [1].
 3. Adjust the home position of the pellet supply arm by moving the mounting plate [3] of the pellet supply arm home sensor (PS39) [2] referring to the engraved lines [4] on the mounting plate [3].
 - a. Move the mounting plate in the direction of the arrow [5] to make the pellet supply arm [6] home position become closer to the glue tank [7].
 - b. Move the mounting plate in the direction of the arrow [8] to make the pellet supply arm [6] home position become further from the glue tank [7].
- Note**
- Adjust the position of the pellet supply arm so that the distance between the arm and the edge of the metal frame is 0mm to 3mm: A when the arm comes to the home position.
 - Do not move the mounting plate excessively or it contacts with the other parts.
4. Loosen a screw [9].
 5. Adjust the pellet supply position by moving the mounting plate [11] of the pellet supply arm upper limit sensor (PS38) [10] referring to the engraved lines [12] on the mounting plate.
 - a. Move the mounting plate in the direction of the arrow [13] to make the angle range of the pellet supply arm [6] become narrower.
 - b. Move the mounting plate in the direction of the arrow [14] to make the angle range of the pellet supply arm [6] become wider.
- Note**
- Adjust the position of the pellet supply arm so that the distance between the arm and the edge of the metal frame is +2mm to -4mm: B when the arm comes to the home position.
 - Do not move the mounting plate excessively or it contacts with the other parts.
6. Turn on the main power switch (SW1) and the power switch (SW2).

7. Carry out the output check "77-43" of I/O check in the service mode to detect the home position of the pellet supply arm and check if the home position is appropriate.
8. Move the pellet supply arm to the pellet supply position using the output check "77-44" of I/O check in the service mode and check if the pellet supply position is appropriate.

Note

- For restrictions or cautions of the output check "77-44", refer to the I/O check mode.
 - When it is hard to check the supply position, turn OFF the sub power switch (SW) and the main power switch (SW1) and remove the suction unit [15]. (Refer to G.19.2.20 Glue tank unit)
9. When the test result is not good, turn off the sub power switch (SW2) and the main power switch (SW1) and repeat steps 2 to 8.
 10. Reinstall the above parts following the removal steps in reverse.

24.4 Glue apply roller gap adjustment

(1) Usage

This adjusts the gap between the metal surface of the glue apply roller and the spine of inside papers. Changing the gap allows you to adjust the amount of glue applied to the spine.

Note

- Reference values: The thickness of glue layer formed on the roller is about 2mm with the gap of 1.8mm.

CAUTION

- The glue tank unit is extremely hot immediately after turning off the main power switch (SW1) or the power switch (SW2) of the main body.
- To prevent burn injuries, make sure to leave the unit until it cools enough before performing the adjustment.

(2) Procedure

1. Remove the rear cover /Rt. (Refer to G.19.2.5 Rear cover /Rt)
2. Loosen 2 screws [1].
3. Adjust the stopper [4] position by moving it up and down with 2 screws [3] referring to the engraved lines [2], then tighten the screws [1].

Note

- The stopper [4] moves down 0.5mm by tightening the screws [3] for 1 rotation and it moves up by loosening the screws.
 - Raising the stopper brings the glue apply roller upward making the gap become smaller, which decreases the amount of glue applied.
 - Lowering the stopper brings the glue apply roller down making the gap become larger, which increases the amount of glue applied.
 - Do not lower the stopper excessively. Too much gap causes the glue application to fail.
 - When raising or lowering the stopper, be sure to adjust 2 screws [3] for the same amount and maintain the horizontal state of the stopper.
4. After performing the adjustment, make a test print and binding to check that the amount of glue applied to the book spine is appropriate.
 5. Reinstall the above parts following the removal steps in reverse.

24.5 Cover paper glue gap adjustment

(1) Usage

This adjustment is to adjust the gap between the surface of the cover paper glue material (scraper /Fr) and the spine of inside paper. Adjust the glue amount applied to the book spine by changing the gap.

There are 2 types of gap, one is for the thick coat mode and the other is for the thin coat mode. *1

Note

- The gap between the scraper /Fr and the spine is 2.5mm in the thin coat mode and 2.5mm in the thick coat mode. *1

- When the gap in the thick coat mode is adjusted, the gap in the thin coat mode is changed. Therefore, be sure to adjust the gap in the thin coat mode also after adjusting the gap in the thick coat mode.

*1 The thick coat mode is not used for 1200/1200P/1051/1250/1250P/1052.

⚠ CAUTION

- The glue tank unit is extremely hot immediately after turning off the main power switch (SW1) or the power switch (SW2) of the main body.
- To prevent burn injuries, make sure to leave the unit until it cools enough before performing the adjustment.

(2) Gap adjustment procedure in thin coat mode

1. Open the front door and move the glue tank unit [1] frontward.

Note

- Be sure to hold the right arm [2] of the glue tank unit to move it.

2. Loosen 1 screw [3].
3. Adjust the thin coat stopper [6] position by moving it up and down with the screw [5] referring to the engraved line [4], then tighten the screw [3] hitting it against the screw [5].

Note

- The thin coat stopper has a scale marked at 1mm interval.
- The thin coat stopper [6] moves down 0.5mm by tightening the screw [5] for 1 rotation and it moves up by loosening the screw.
- Raising the thin coat stopper brings the cover paper glue part closer to the book spine and it makes the scraped-off glue amount larger, which reduces the glue amount applied to the book spine.
- If the applied glue is thin and the cover does not stick to the book body, lowering the thin coat stopper (increasing the gap between the cover paper glue part and the book spine) increases the amount of glue applied to the book spine.
- If the applied glue is thick and the glue comes out too much, lifting the thin coat stopper (decreasing the gap between the cover paper glue part and the book spine) reduces the amount of glue applied to the book spine.

4. After performing the adjustment, make a test print and binding to check that the glue amount applied to the book spine is appropriate.

(3) Gap adjustment procedure in thick coat mode

1. Open the front door and move the glue tank unit [1] frontward.

Note

- Be sure to hold the right arm [2] of the glue tank unit to move it.

2. Loosen 2 screws [3].
3. Adjust the thick coat stopper [6] position by moving it up and down with the screw [5] referring to the engraved line [4], then tighten the screw [3] hitting it against the screw [5].

Note

- The thick coat stopper [6] moves down 0.5mm by tightening the screws [5] for 1 rotation and it moves up by loosening the screws.
- The thick coat stopper has a scale marked at 1mm interval. The right and left scales shift 0.5mm vertically. When adjusting it, be sure to move it by 1mm and check the position.
- When raising or lowering the thick coat stopper, be sure to maintain its horizontal state.
- Raising the thick coat stopper brings the cover paper glue part closer to the book spine and it makes the scraped-off glue amount larger, which reduces the glue amount applied to the book spine.
- If the applied glue is thin and the cover does not stick to the book body, lowering the thick coat stopper (increasing the gap between the cover paper glue part and the book spine) increases the amount of glue applied to the book spine.
- If the applied glue is thick and the glue comes out too much, lifting the thick coat stopper (decreasing the gap between the cover paper glue part and the book spine) reduces the amount of glue applied to the book spine.

4. After performing the adjustment, make a test print and binding to check that the glue amount applied to the book spine is appropriate.
5. Conduct the gap adjustment in the thin coat mode.

24.6 Glue tank movement rail tilt adjustment

(1) Usage

This adjusts the parallelism between the glue tank movement rail and the spine of inside papers.

Perform this when glue is not applied uniformly on the spine, especially when amount of glue applied is different between the top and bottom side of the book.

(2) Procedure

a075f3c020ca

1. Loosen 3 screws [2] of the bracket /Rt [1].
2. Loosen 2 screws [4] of the bracket /Lt [3].
3. Move the brackets /Rt [1] and /Lt [3] up and down by turning the screws [7] and [8] to adjust the height of the glue tank movement rails/Rt [9] and /Lt [10] referring to the engraved lines [5] and [6] on the brackets /Rt and /Lt.

Note

- Be sure to turn the screws [7] and [8] by the same amount so that the brackets/Rt [1] and /Lt [2] move the same amount.
- When the glue applied to the spine gets lower toward the bottom side, lower the brackets/Rt [1] and /Lt [2].

4. After performing the adjustment, make a test print and binding to check that the glue is applied to the book spine uniformly.

24.7 Cover paper folding plate nipping adjustment

(1) Usage

This adjusts the position of the cover paper folding plate/Lt to apply pressure to the cover paper.

Perform this adjustment when the cover paper is not folded at the right angle (when the book spine inclines).

(2) Procedure

a075f3c021ca

1. Turn the knob [1] to move the cover paper alignment plate/Fr [2] backward.
2. Loosen the screw [3] and adjust the actuator [6] position of the cover paper folding plate HP sensor /Lt (PS49) [5] by moving the actuator right and left referring to the engraved lines [4].

Note

- [7] shows the book exit direction;
 - a. When the book spine inclines as [8]: Move the actuator [6] to the left.
 - b. When the book spine inclines as [9]: Move the actuator [6] to the right.

3. After performing the adjustment, make a test print and binding to check that the book spine ends form right angle and no inside papers come off from the cover paper.

Note

- At the test print, print more than 50 sheets, or you cannot check the book spine.

24.8 Cover paper folding plate parallel adjustment**(1) Usage**

This adjusts the parallelism between the cover paper folding plate/Rt and /Lt.

Perform the adjustment when the book spine corners are not uniformly formed from the top and the bottom.

(2) Procedure

a075f3c022ca

1. Remove the cover paper tray. (Refer to [G.19.2.28 Cover paper tray](#))
2. Remove 4 screws [1] and remove the cover /Rt [2].

a075f3c023ca

3. Loosen 4 screws [1].
4. Put a hand from under the cover paper tray section and turn the knob [2] to move the cover paper folding plate /Rt [3] and /Lt [4] so that the gap between them becomes a few millimeters [5].
5. Slowly turn the knob [2] in reverse until the cover paper folding plate/Rt [3] and /Lt [4] contact each other without any gap at both front side [6] and rear side [7].

Note

- Make sure that the pressure drive plate/Rt [8] does not run on the pressure assist plate [9].
- Do not turn the knob [2] too much. Doing so brings the plates into pressure-applying state making the position adjustment impossible.

6. Tighten 4 screws [1].
7. After performing the adjustment, make a test print and binding to check that the book spine ends are forming right angle from the top and the bottom.
8. Reinstall the above parts following the removal steps in reverse.

24.9 Cover paper table up down belt adjustment**(1) Usage**

Perform the adjustment when the following conditions occur.
 The cover paper table up down drive system does not synchronize successfully.
 The front and rear cover paper table belts do not synchronize smoothly.

(2) Check point

Check that the pin [1] is placed on the center of the central sector of the gear [2].
 When the pin is out of the center, perform the following adjustment.

a075f3c030ca

(3) Procedure

a075f3c024cb

1. Remove the rear cover. (Refer to [G.19.2.5 Rear cover /Rt](#))
2. Remove the E-ring [1].
3. Move the gear [2] to the right [3] and remove the pin [4].
4. Remove the E-ring [5].
5. Move the gear [2] to the left [6] and install the E-ring [1].
6. Turn ON the main power switch (SW1) and the sub power switch (SW2) to let the system perform the initial operation.
7. Insert the pin [4], adjust the gear [2] so that it aligns with the gear inside, and slide the gear [2] to the right.
8. Install the E-ring [5] Install the rear cover
9. Install the rear cover.

24.10 Cover paper alignment plate adjustment**(1) Usage**

This adjusts the position of the cover paper alignment plate/Fr in the main scan direction and its perpendicularity against the main scan direction.

Perform the adjustment when the cover paper and the inside papers are vertically or relatively misaligned.

Note

- The misalignment of cover and inside paper can also be adjusted in "[I.24.2 Clamp main scan direction alignment adjustment](#)" and "[I.24.12 Cover paper table positioning](#)".

(2) Procedure

1. Loosen the screw [1] and [2].
2. Adjust the position and angle of the cover paper alignment plate / Fr [9] by moving the mounting brackets /Rt [5] and /Lt [6] to the front [7] and to the back [8] referring to the engraved lines [3] and [4].

Note

 - Do not move the mounting bracket /Lt [6] excessively, or the plate contacts with the gear [10].
 - [11] shows the book exit direction;
 - a. When the cover paper runs off the top edge of inside paper [12]: Move the mounting brackets /Rt [5] and /Lt [6] forward [7] by the same distance.
 - b. When the cover paper runs off the bottom edge of inside paper [13]: Move the mounting brackets /Rt [5] and /Lt [6] backward [8] by the same distance.
 - c. When 3 edges of cover paper misalign with the edges of inside paper [14]: Move the mounting bracket /Rt [5] backward [8] and move the mounting bracket /Lt [6] forward [7].
 - d. When 3 edges of cover paper misalign with the edges of inside paper [15]: Move the mounting bracket /Rt [5] forward [7] and move the mounting bracket /Lt [6] backward [8].
3. After performing the adjustment, make a test print and binding to check that the cover paper is neatly aligned with the inside papers.

24.11 Cover paper cutting skew adjustment**(1) Usage**

Perform the adjustment when the roller cutter trims the cover paper askew.

(2) Procedure

1. Remove the scraps box.
2. Remove 3 screws [1] and remove the metal frame [2].

- Loosen the screw [1] and adjust the position of the roller cutter assy [3] by moving it to the right [4] and the left [5] referring to the engraved lines [2].

Note

- When the length of the back cover is shorter than the length of the front cover at the bottom side:
Move the roller cutter assy [3] to the right side [4].
- When the length of the back cover is longer than the length of the front cover at the bottom side:
Move the roller cutter assy [3] to the left side [5].

- After performing the adjustment, make a test print and binding to check that the cover paper is trimmed correctly.
- Reinstall the above parts following the removal steps in reverse.

24.12 Cover paper table positioning**(1) Usage**

This adjusts the relative position between the clamp unit and the cover table unit in the main scan direction. Perform the adjustment when the cover paper is vertically misaligned with the inside papers.

Note

- The misalignment of cover and inside paper can also be adjusted in "[I.24.2 Clamp main scan direction alignment adjustment](#)" and "[I.24.10 Cover paper alignment plate adjustment](#)."

(2) Procedure

- Loosen 3 screws [1].
- Adjust the position of the positioning pin/Fr [3] by moving it forward [4] and backward [5] referring to the engraved lines [2].

Note

- [6] shows the book exit direction;
 - When the cover paper runs off the top edge of inside paper [7]: Move the positioning pin /Fr [3] to the back [5].
 - When the cover paper runs off the bottom edge of inside paper [8]: Move the positioning pin /Fr [3] to the front [4].

- After performing the adjustment, make a test print and binding to check that the cover paper is neatly aligned with the inside paper.

24.13 Cover paper tray pick-up adjustment**(1) Usage**

Perform the adjustment when no feed from the cover paper tray occurs frequently.

(2) Procedure

[2]

[1]

[3]

a075f3c001ca

[2]

a075f3c002ca

1. Pull out the cover paper tray.
 2. Remove all remaining cover papers from the cover paper tray.
 3. Loosen a screw [1].
 4. Push the stopper [3] in the direction of the arrow with the release lever [2] retracted, and secure the stopper [3] with the screw [1].
- Note**
- After performing the adjustment, loosen the screw [1] and retighten it after releasing the stopper [3].
5. Install the cover paper tray, and pull out the tray again after the cover paper lift plate has lifted to the upper limit, which can be judged by the operating sound of the cover paper lift motor.
 6. Remove the stopper screws, 1 each, attached on the right and left rails and pull the cover paper tray further out. (Refer to [G.19.2.28 Cover paper tray](#))

7. Remove 2 screws [1] to remove the paper feed cover [2].

a075f3c003ca

8. Pull the plunger [2] of the pick-up solenoid [1] and measure the gap between the pick-up roller [3] and the cover paper lift plate [4] with a thickness gauge.
Measured value A = 0.1mm to 1.5mm
If it is not within the standard value, follow step 9 and after.
9. Loosen a screw [5].

Note

- Before loosening the screw, be sure to mark off the position of the pick-up solenoid [1] by drawing a line [6].

10. With the plunger [2] pulled, adjust the position of the pick-up solenoid [1] so that the gap between the pick-up roller [3] and the cover paper lift plate [4] falls into the specified range.
11. Tighten the screw [5] to fix the pick-up solenoid [1].
12. Load cover paper on the cover paper tray and close the tray.
13. Make a test print and binding selecting the perfect binding as the binding method and the PB cover paper tray as the cover feeder. Check that the no feed error does not occur.
14. Reinstall the above parts following the removal steps in reverse.

24.14 Cover paper tray pick-up roller height adjustment**(1) Usage**

Perform this adjustment when no-feed, crimp of leading edge, or paper jam occurs frequently when feeding the cover papers from the cover paper tray, or when curled cover papers need to be used.

This adjusts the vertical position of the cover paper pick-up roller. Changing the roller position changes the vertical gap between the top paper surface on the tray and the bottom surface of the cover paper feed roller.

Note

- With this adjustment, cover paper pick-up ability changes accordingly. When the adjustment is completed, make sure to perform the cover paper feed pick-up amount adjustment to check the pick-up amount.

(2) Procedure

[2]

[1]

[3]

a075f3c004ca

[2]

a075f3c005ca

[3]

[4]

a075f3c006ca

1. Pull out the cover paper tray.
2. Remove all remaining cover papers from the cover paper tray.
3. Loosen a screw [1].
4. Push the stopper [3] in the direction of the arrow with the release lever [2] retracted, and secure the stopper [3] with the screw [1].

Note

- After performing the adjustment, loosen the screw [1] and retighten it after releasing the stopper [3].

5. Install the cover paper tray, and pull out the tray again after the cover paper lift plate has lifted to the upper limit, which can be judged by the operating sound of the cover paper lift motor.
6. Remove the stopper screws, 1 each, attached on the right and left rails and pull the cover paper tray further out. (Refer to [G.19.2.28 Cover paper tray](#))
7. Pull out the tray again. Remove 2 screws [1] to remove the paper feed cover [2].

8. Check that the actuator [1] of the pick-up roller assy is aligned with the center [3] of the cover paper tray upper limit sensor (PS74) [2].
9. Remove the pick-up roller section [4]. (Refer to [F.20.3.1 Removing/reinstalling the pick-up roller assy and the separation roller assy](#))

a075f3c007ca

10. Mark off the position of the cover paper tray upper limit sensor mounting plate [1] by drawing a line [2].
11. Remove 2 screws [3] and temporarily install the cover paper upper limit sensor mounting plate [1] with the screws through the elongated screw holes [4].
12. Make vertical adjustments of the cover paper upper limit sensor mounting plate [1] and fasten it with the screws [3].

Note

- Be sure to install the cover paper tray upper limit sensor mounting plate [1] so that it keeps in a horizontal position.

Reference:

- Raising the position of the cover paper tray upper limit sensor brings the pick-up roller [5] down (It increases the vertical gap [7] between the paper feed roller [6] and the pick-up roller [5].)
- Lowering the position of the cover paper tray upper limit sensor brings up the pick-up roller [5] (reduces the vertical gap [7] between the cover paper feed roller [6] and the pick-up roller [5]).
- When crimp of leading edge or paper jam occurs, or when curled cover paper (concave curl) need to be used, raise the cover paper tray upper limit sensor mounting plate.
- When feeding warped cover paper (convex curl), lower the cover paper tray upper limit sensor mounting plate.

13. Reinstall the pick-up roller assembly.

Note

- Be sure to install the cover paper tray upper limit sensor mounting plate [1] so that it keeps in a horizontal position.

14. Load cover paper on the cover paper tray and close the tray.
15. Make a test print and binding selecting the perfect binding as the binding method and PB cover paper tray as the cover feeder. Check that the errors do not occur. If the errors still occur, repeat steps 9 to 15.
16. Check the cover paper tray paper feed pick-up adjustment. (Refer to [I.24.13 Cover paper tray pick-up adjustment](#))
17. Reinstall the above parts following the removal steps in reverse.

24.15 Cover paper tray separation pressure adjustment

(1) Usage

Perform this adjustment when no-feed or multi-feed from the cover paper tray occurs frequently.

Note

- A no-feed error tends to occur in low temperature environment, while a multi-feed error does in high temperature environment. Perform this adjustment with this in mind.
- Do not make an excessive adjustment. Doing so may reverse the respective symptoms.

(2) Procedure

1. Pull out the cover paper tray.
2. Change the position of the spring adjustment lever [1]. The separation pressure is strengthened when the lever moves to the direction [2] and is weakened when the lever moves to the direction [3].
Weak: A double feed jam is improved.
Strong: A no feed jam is improved.
Reference:
 - The spring load changes in increments of about 10%.
3. Set the cover paper tray.
4. Make a test print and binding selecting the perfect binding as the binding method and PB cover paper tray as the cover feeder.
Check that no-feed errors or multi-feed errors do not occur.
5. If the errors still occur, repeat steps 1 to 4.

24.16 Cover paper tray Centering Adjustment**(1) Usage**

Perform this adjustment when the deviation between the cover paper and the inside papers is out of spec.
Standard value: $0 \pm 1\text{mm}$ or less (aligned edges), $0 \pm 1.5\text{mm}$ or less (trimmed edges)

(2) Procedure

1. Make a test print and binding selecting the perfect binding as the binding method and PB cover paper tray as the cover feeder.
Check how much the cover paper misaligns with the inside papers.
2. Pull out the cover paper tray.
3. Remove all remaining cover papers from the cover paper tray.
4. When the cover paper guides [1] are set at the small-size position, extend them.
5. Loosen 2 screws [2].
6. Move the cover paper guides [1] and adjust the center position based on the misalignment amount checked at step1, referring to the marking-off line [3].
7. Tighten 2 screws [2].
8. Load cover paper on the cover paper tray and close the tray.
9. Make a test print and binding selecting the perfect binding as the binding method and PB cover paper tray as the cover feeder.
Check that the misalignment amount falls into the specified range.
Standard value:
 $0 \pm 1\text{mm}$ or less (aligned edges)
 $0 \pm 1.5\text{mm}$ or less (trimmed edges)
10. If the value falls outside the range, repeat the steps 2 to 9.

24.17 Cover paper tray lift plate horizontal adjustment**(1) Usage**

Conduct this adjustment when the jam, no feed, or the folded paper occurs in the cover paper tray.

(2) Procedure[2] [1] [3]
a075f3c010ca[3]
a075f3c011ca

1. Pull out the cover paper tray.
2. Remove all remaining cover papers from the cover paper tray.
3. Loosen a screw [1].
4. Push the stopper [3] in the direction of the arrow with the release lever [2] retracted, and secure the stopper [3] with the screw [1].

Note

- After performing the adjustment, loosen the screw [1] and retighten it after releasing the stopper [3].

5. Install the cover paper tray, and pull out the tray again after the cover paper lift plate has lifted to the upper limit, which can be judged by the operating sound of the cover paper lift motor.

6. Check if the cover paper lift plate [3] is placed horizontally using the engraved lines on the near side [1] and the far side [2] of the tray. If the plate is not horizontal, perform step7 and the steps that follow.

a075f3c012ca

7. Remove 6 screws [1] of the cover paper tray front cover [3].
8. Disconnect the connector [2], and remove the cover paper tray front cover [3].

a075f3c013ca

9. Lift up the pick-up roller [1].
10. Move the cover paper guides [2] to the positions for the smallest paper size.
11. Remove the screw [3] and tighten it through the elongated screw hole [4] temporarily.
12. Loosen the screw [5] while supporting the pulley mounting plate [6] by hand, and correct the tilt of the cover paper lift plate [8] referring to the engraved lines [7].
13. Check that the cover paper lift plate [8] is placed horizontally, and secure the plate with the screw [5] and [9].

Note

- When tightening the screws [5] and [9], check that the wire [10] has not come off the pulley or not crossed.

14. Pull down the pick-up roller [1].
15. Load cover paper on the cover paper tray and close the tray.
16. Make a test and binding selecting the perfect binding as the binding method and PB cover paper tray as the cover feeder. Check that cover papers are fed normally without any jam.
17. Reinstall the above parts following the removal steps in reverse.

24.18 Height adjustment**(1) Usage**

Conduct this adjustment when the PB is not in a horizontal position or when the height of PB is not equal to the main body and the other options.

(2) Procedure

[6] [7] [5] [4]
a15xf3c007ca

1. Loosen the nut [2] of the caster /B [1] at 2 places.
2. Rotate the screw [3] at 2 places for adjusting the height of the PB left side.
3. Conduct the height adjustment by inserting the driver to the holes [6] and [7] on each of 4 ratchet section [5] of the casters /A [4] and moving it back and forth. It goes up with the hole [6] and goes down with the hole [7].

Note

- Be sure to make adjustments while considerate the height between the main body and other optional devices.
- Be sure not to go it up too much, otherwise the bolt comes off.
- When the caster /A [4] is not on the ground, fix the caster so that the ratchet does not spin out.
- Be sure to adjust so that every casters /A and /B are on the ground.

4. Secure the screw [3] of the caster /B [1] at 2 places and tighten the nut [2].

J REWRITING OF FIRMWARE

1. OUTLINE

1.1 Precautions on rewriting the firmware

(1) ISW execution procedures

When executing the ISW over the entire system, be sure to execute it in the order given below. (To minimize the occurrence of malfunction resulting from the mismatch of the firmware version)

Step	Type of programs
1 *1	DF(F), ZU-608(Z), FS(N), SD-510(K), GP-501(G), GP-502(M1, M2, M3), LS 1st tandem (S1), LS 2nd tandem (S2), LS 3rd tandem (S3), RU-509(R1), RU-510(R2), FD(H), SD-506(B), PB(J), Loadable device driver
2	IC Control (P)
3	Printer control (C)
4	Overall control (I)

*1 Be sure to conduct the low end first out of those set in the sequence¹.

Example) When the composition is made up of "LS-505 (1st tandem) + LS-505 (2nd tandem) + SD-506"

SD-506 (B)→LS-505 (S-2)→LS-505 (S-1)

Note

- When the overall control board is replaced, be sure to conduct first of all the ISW of the image control program. When the image control program is not contained in the overall control board, other programs cannot be written.
- Programs are not stored in the image processing board. So, when the board is replaced, the ISW is not required.
- When SSD of the IC controller is replaced, be sure to execute ISW for the controller program.

(2) DIPSW and toggle SW setting on the boards

Note

- When the FDCB, the SDCB, the LSCB or the PBCB is replaced, be sure to conduct the machine setting of the main body by the DIPSW (FD, SD or PB) on the control board (refer to [L.2.14.1 FD control board \(FDCB\)](#), [L.2.15.1 SD control board \(SDCB\)](#) or [L.2.16.1 PB control board \(PBCB\)](#)) or by the LS toggle SW (refer to [G.16.2.4 Caution when setting models using toggle SW](#)). After that setting, conduct the ISW.

(3) Connecting short connector when rewriting firmware

Be sure to connect the short connector to the post-processing option by following the table as follows.

PRESS 1250/1250P

	RU-509	GP-501	GP-502*2	RU-510	LS-505	FD-503	SD-506	PB-503	FS-532
When the option is connected to the upstream (PI-PFU/ RU-509/ RU-510 is connected right after the main body.)	Not required	Not required	Connect the short connector (2 wire bundles)*2	Not required	Not required	Not required	Not required	Not required	Not required

*1 When GP-502 connected right after the main body, connecting the short connector is not required.

*2 When the option connected to the upstream is PI-PFU, connecting the short connector is not required.

PRESS 1052

	RU-509	GP-501	GP-502	RU-510	LS-505	FD-503	SD-506	PB-503	FS-532
When the option is not connected to the upstream (right after the main body)	Not required	Not required	Not required	Not required	Connect the short connector which is connected to the main body to LS	Connect the short connector to CN-19 of the board	Connect the short connector to CN-19 of the board	Connect the short connector to CN-19 of the board	Not required
When the option is connected to the upstream (PI-PFU/ RU-509/ RU-510 is connected right after the main body.)	Not required	Not required	Connect the short connector (2 wire bundles)*1	Not required	Not required	Not required	Not required	Not required	Not required

*1 When the option connected to the upstream is PI-PFU, connecting the short connector is not required.

For PRO 951, all options not to be connected to the short connector.

1.2 Firmware data flow

The following shows the flow of the ISW data.

1.3 Main body setting for ISW

There are the following 2 ways for settings on the main body side.

(1) Type of setting

- Power ON mode
This mode is used when the firmware is not installed to the overall control board (OACB) or when it is damaged. In this condition, ISW of the OACB is possible when sub power switch (SW2) is turned ON.
- Service mode
This mode is used when the firmware of the OACB is installed properly.

(2) When in the version up of the program

Target board	Display when the power is turned ON	Mode
Overall control board	Normal	Service mode
Other boards	Normal	Service mode

(3) When writing new firmware (When replacing board and rewriting firmware failed)

Target board	Display when the power is turned ON	Mode
Overall control board	Power save LED blinks in orange	Power ON mode
	No display on touch panel	
Other boards	Error code display	Service mode

(1) For the overall control board (OACB), when something is wrong with the firmware or no firmware is written, the normal start-up cannot be made. In this condition, the power save LED blinks in orange when power switch is turned ON and placed in the firmware stand-by mode.

Note

- Firmware can only be written in Boot USB memory ISW.**
- (2) For other boards, when the firmware of the overall controller is normal and something is wrong with other firmware, a malfunction code is shown on the touch panel when the power is turned ON. In that case, enter the service mode and perform ISW normally.

1.4 Type

(1) USB Memory ISW

Directly connect the USB memory to the service port of the main body, and use the program stored in the USB memory to rewrite the firmware. For the USB memory ISW, the following methods are available depending on the start up method.

- USB memory ISW from service mode
Rewrite the firmware using the operation panel.
- Boot USB memory ISW when turning ON the power
Conduct when replacing the overall control board (OACB) or failed in rewriting a firmware.

(2) Internet ISW

Use the main body NIC to connect the main body to network environment, and use the FTP or the HTTP protocol to rewrite firmware via the program server on the Internet. For the Internet ISW, the following methods are available.

- Internet ISW using the Web Utilities
Rewrite the firmware by accessing the Web Utilities of the main body from the Web browser of the PC.
However, a network connected PC with the main body is required.
- Internet ISW using the operation panel
Rewrite the firmware using the operation panel.
- Internet ISW using the CS Remote Care

1.5 Error list

Detection function

- When the copier main body detects an abnormal condition after turning on the power, the copier does not display it on the main body touch panel, but inform you of it by lighting or flashing the LED (with the ISW placed in the standby condition). For the LED display, refer to the following table.

No.	Transaction	Power save LED status
1	CPU in initialization when the power is turned on	OFF
2	Flush memory in checking	OFF
3	When an error is detected while in memory check (ISW standby status)	Flashing in orange
4	Reading file from USB memory	Lighting in green
5	Erasing flash memory	Lighting in green
6	ISW processing (when the data is being received from the USB memory and the flush memory is being written)	Flashing in green
7	When an abnormality is detected while in data transmission	Flashing alternately in red and green
8	When an error is detected while in writing flush memory	Flashing in red
9	Memory check successfully completed: while in rebooting	OFF

(1) Main body error list

The following table shows error codes.

Error code	Description	Program applicable	Transaction
02	The internal work space cannot be secured.	P	1
04	The DRAM space cannot be secured.		
05	The DRAM space cannot be opened.		
06	Data transmission to the DRAM failed.		
21	The DRAM space on the controller side cannot be secured.		
41	The format of the input data is abnormal.	Common	2
42	The type name of input data is abnormal.		
43	The board name of input data is abnormal.		
64	Rewritten address error	F	2
81	Input device such as input time out is abnormal.	Common	3
C1	The erasing of the flush ROM failed.	I / T / W	4
C2	The writing of the flush ROM failed.		
C3	The ROM checksum is abnormal.		
C4	Output device such as output time out is abnormal.	Common	6
E1	Program SUM check error.	F	5
	Controller I/F writing error.	P	
	Erase error.	C/H/B/N/S/J/R /K/Z/M	
E2	Writing error.	C/H/B/N/S/J/R /K/Z/M	5
	Controller I/F verify error.	P	
E3	Blanc check error.	F	6
	Communication error.	C/H/B/N/S/J/R /K/Z/M	
E4	Switching the ISW mode of the FNS control board fails.	C/H/B/N/S/J/R /K/Z/M	8
44	CRC code check error	Common	9
100	Network connection error, USB memory connection error	Common	10
101	Error of the file which is downloaded from the network or the USB memory	Common	2
4xx	When the connection to the network is made with the communication protocol set by HTTP, a server error is returned from the server.	Common	11
5xx	When the connection to the network is made with the communication protocol set by FTP, a server error is returned from the server.	Common	11

Note

- For rewriting the IC firmware, the execution of the ISW is inhibited in case the initialization of the IC has not completed.
- When any one of the errors shown above occurs, an error code is not displayed, but the message "Now initializing Controller" is shown in the touch panel section.

(2) Troubleshooting procedure for the main body error

Troubleshooting No.	Troubleshooting procedure
1	The program is not running properly. Turn OFF/ON the main power switch (SW1) and the sub power switch (SW2) and execute ISW again. If the error still occurs after some repetitions, the trouble of the overall control board (OACB) is conceivable.
2	Check the ISW transfer data file and execute ISW again.

3	The flash ROM abnormality. If the same error still occurs continuously after executing ISW again, replace the overall control board (OACB).
4	The checksum result after writing the program and the checksum data displayed on the ISW transfer data file do not match. If the same error still occurs continuously after executing ISW again, it is conceivable that the ISW transfer data is not generated properly.
5	It detects an abnormality on the target ISW board. Check the target board of ISW.
6	Check the I/F between OACB and the printer control board (PRCB). Turn OFF/ON the SW1 and SW2 of the main body, and execute ISW again.
7	The communication between OACB, the printer control board (PRCB), and the FNS control board (FNSCB) is not conducted normally. Turn OFF/ON the SW1 and SW2 of the main body, and execute ISW again.
8	The CRC code result after transferring the program and the CRC code data displayed on the ISW transfer data file do not match. If the same error still occurs continuously after executing ISW again, replace the USB memory for the ISW and then execute ISW.
9	Check the network connection setting or the connecting status of the USB memory, and then execute ISW again.
10	Check the network setting of FTP/HTTP, and then execute ISW again.

2. ISWTTrns_G

2.1 Specifications

2.1.1 ISWTTrns_G (PC software)

(1) Operating environment of the software

- OS: Windows95/98/98SE/Me/NT4.0/2000/XP/Vista Home Basic/Home Premium/Business/Enterprise
- CPU: Pentium 75MHz or above
- Memory: 32MB or above
- Free space in hard disk: 100MB or more
- Others: PC provided with USB interface (TypeA)

The operation environment of the hardware is pursuant to the specification of each OS.

(2) Requirements for checking the check sum

- Personal computer (PC): 1
PC provided with USB interface
- ISWTTrns_G program
- Firmware

2.2 Installation of the ISWTTrns_G

Install the ISWTTrns_G program to the PC.

(1) Procedure

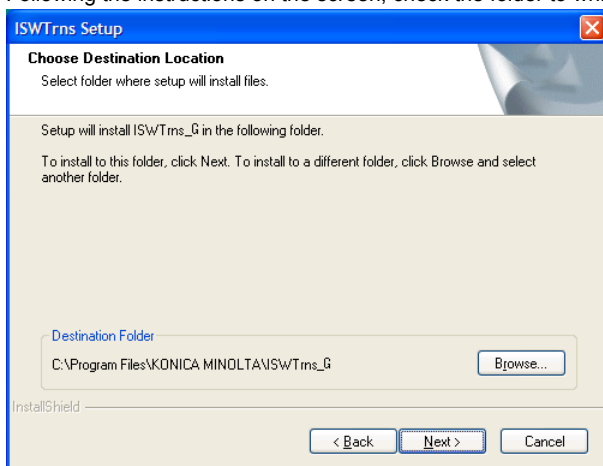

1. Start the PC.
2. Copy the setup files to the PC and double click the [Setup.exe] icon to start the install program.

Note

- When there remains the ISWTTrns_G.exe of the old version, uninstall the old version first, and then install the new version.

3. "ISWTTrns setup screen"

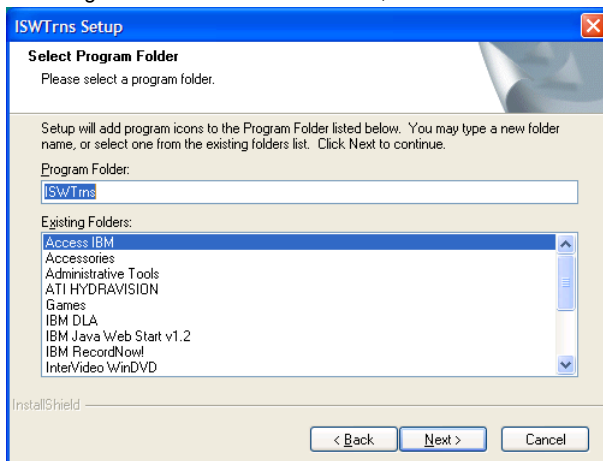

Following the instructions on the screen, check the folder to which an installation is made, and then click [Next].

Note

- "C:\Program Files\KONICA MINOLTA\ISWTTrns_G" has been set as a folder to be installed in default.
When changing the folder to which an installation is made, click [Reference] and specify one as you please.

4. Following the instructions on the screen, check the folder to which the ISWTTrns program is stored and then click [Next].

Note

- For default, "ISWTTrns" is set as a folder to which an installation is made.
When changing the folder to which an installation is made, enter a folder name directly, or select one from the existing folder displayed.

5. Following the instructions on the screen, click [Completed].
 6. The installation of the ISWTrns_G program is automatically completed.
 7. Select "ISWTrns_G" from the start menu or double click the "ISWTrns_G" icon on the desk top to start up the "ISWTrns program_G."
 8. "ISWTrns dialog screen"
- Click [OK] to set the storage folder of the firmware.

**Note**

- This screen is shown only when the program is started for the first time after installing the ISWTrns_G.

9. "Option screen"
- Click [Make Folder].

**Note**

- A folder (C:\Program Files\KONICA MINOLTA\ISWTrns_G) on which the ISWTrns_G program is installed has been set as a storage folder in default.
- When changing a storage folder, click [Browse] and specify the folder, or make an entry directly in the editor box in full path.
- Clicking [Make Folder] creates hierarchical folders with the storage folder set above as a route.

10. "Option screen"
- Click [OK].

Note

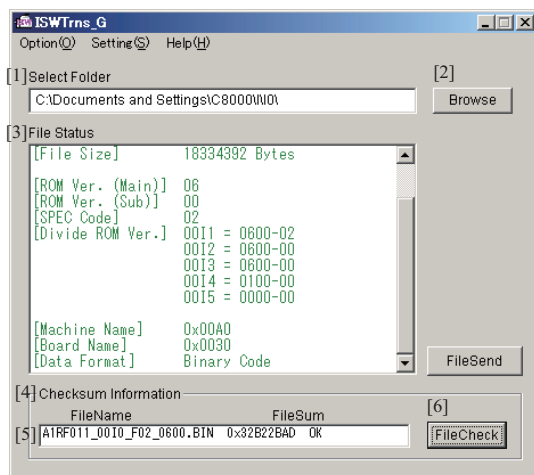

- This operation stores the data folder created in the step9 into the INI file of the ISWTrns program.

2.3 Usage of the ISWTrns_G

2.3.1 Firmware checksum check

(1) Details on the operation panel display

When the ISWTrns_G program starts up, the main screen of the ISWTrns_G is displayed. On the main screen, perform selecting of the file (firmware), information display and checksum. For detailed information of the functions, refer to the following.

[1]: Select Folder (File storage folder edit box)

A folder name is displayed in full path from the information of the data folder set and the INI file. When the firmware is in a folder other than the specified data folder, click [Browse] [2] to specify the file location or entering directly the file location.

[2]: [Browse]

This key is used when the firmware is in a folder other than the specified data folder. Display the folder selection screen to select the folder of [1].

[3]: File Status (File detail information)

View detailed information about the version file when select firmware.

[4]: Checksum Information frame

Display the firmware to be used based on the information selected in the frames [1], and click [File Check] [6] to display the checksum of the file and the consistency (OK, NG, ??) of the checksum.

[5]: File information display frame

Display the file version selected.

Click [File Check] at [6] to calculate the checksum of the entire displayed files. Compare the obtained value with the checksum value stored in the checksum file (*.sum) attached to the firmware to display the result.

[6]: [File Check]

With a file used in "Checksum Information" of [4] displayed, press this key to calculate the file checksum (checksum of the entire file) of the displayed file and show a result beside the file. Also, compare the result of the checksum with the checksum file attached to the firmware and display the obtained result in the following form.

"OK": accord

"NG": Not accord

"??": Checksum file (*.sum) not found

2.4 Error list

(1) ISWTrns_G error list

The ISWTrns_G displays messages when an error is shown or the operation is completed. The following table shows the contents of the message and the status of the ISWTrns_G.

Message	Status of the ISWTrns_G
The opening of the file the checksum of which is to be taken is not available.	The opening of the checksum file failed. The file is in use or damaged.
The opening of the file the checksum of which is to be taken cannot be read.	The reading of the checksum file failed. The memory is insufficient or the OS is in trouble.
The folder name is illegal.	The name of the input folder is illegal. Be sure to enter the whole path from the drive name such as "C:¥."
The default folder has not been set. Set the folder correctly.	The data folder setting has not been set to the ISWTrns.INI. Displays at the first startup only.
Some files cannot be copied.	1. The folder to be stored in does not exist. 2. When a file is copied into the folder in which a file of the same name is contained with "O/W (overwrite check box)" not checked. 3. When overwriting is made on an overwrite prohibited file. 4. Another application is using the file. OS trouble.
The transferred file is not found, or a file with an illegal name is found in the folder. Make sure of it.	The number of divisions of the transferred file written in the checksum file does not correspond with the number of files that actually exist. 1. When a file with an illegal name is in the data folder, or a file name that seems to be illegal is displayed in the folder list. 2. The number of divided files is insufficient. Check the insufficient number of files in the folder list and copy them again. 3. When the checksum file is damaged, copy it again to the folder.

(2) ISWTrns_G troubleshooting

When an error occurs while in the execution of the ISWTrns_G program, take the measures shown in the following table.

	Condition	Cause	Countermeasures
1	The ISWTrns_G does not start up.	The IswTrns_G.EXE file is damaged	Set it up again.
		The setup file itself is damaged.	Check the setup file and set it up again.
2	When an item in the combo box is selected, the file is not displayed.	The file is not stored in the relevant folder.	Check to see if the relevant file is stored in the folder displayed in the "Select Folder" text box. When a folder into which a file is stored is not found, use the "File copy" function.
		The Data Folder in the Option screen is set incorrectly.	Check the setting of the Data Folder. When a folder into which a file is stored is not found, use the "File copy" function.
		The file name is illegal (or has been changed.)	The file name must be used with no change made. When the file name is changed, the display or selection of the file becomes unavailable. When the file name is changed, return it to former state.
		The folder name is illegal (or has been changed.)	When the folder name created by the [Make Folder] button in the Option screen has been changed, it cannot be found. Return it to former state and check it again.
3	"NG" is displayed in the File Check.	The firmware using is damaged.	Copy the firmware and check it again. When "NG" still recurs, contact the supplier of the firmware.
4	"??" is displayed while in the File Check.	When the firmware was copied to the PC, the copying of the checksum file (*.sum) was forgotten.	Copy the checksum file to the folder same as the firmware at the same time. (When using the data copying function, a copy is made automatically.)

3. USB MEMORY ISW

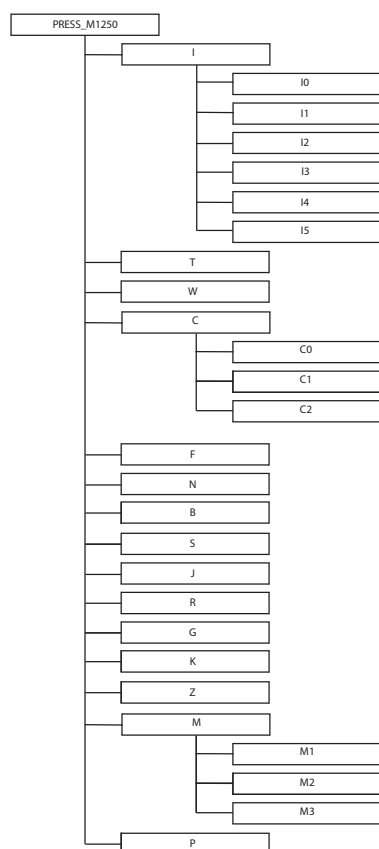

3.1 Usage of the USB memory ISW

(1) Board to be rewritten and firmware

Item	Specifications	
Board to be rewritten	Overall control board (OACB), Printer control board (PRCB), DF control board (DFCB), IC board (ICB), ZU control board (ZUCB), FNS control board (FNSCB), SD control board (SDCB), LS control board (LSCB), RU control board (RUCB), FD control board (FDCB), PB control board (PBCB), GP controller PCB	
Rewritable firmware	Image control	Collective (I0), I1 to I5, T, W
	Printer system	Collective (C0), C1, C2
	ADF	F
	IC controller	P
	Z-folding unit (ZU-608)	Z
	Stapler (FS-532)	N
	Saddle unit (SD-510)	K
	Multi puncher (GP-501)	G
	Ring binder (GP-502)	M1, M2, M3
	Stacker (LS-505)	S1 (1st tandem), S2 (2nd tandem), S3 (3rd tandem)
	RU (RU-509)	R1
	RU (RU-510)	R2
	Multi folder (FD-503)	H
	Saddle stitcher (SD-506)	B
	Perfect binder (PB-503)	J
	Loadable Device Driver	

(2) Procedure

1. Save the firmware to the USB memory in the following folder structure.

Note

- Create the PRESS_M1250 folder directly under the USB memory route.
- Several firmware can be saved to a folder. However 24 files is the maximum it can display on the touch panel. Also, 2 byte font cannot be displayed.
- Maximum 40 letters for a file name.
- The folder structure is common to 1250P/1052/951.

- The file name is the same for S1, S2, and S3. When S1 is selected on the rewriting screen, the file is written in the 1st tandem of LS. When S2 is selected on the rewriting screen, the file is written in the 2nd tandem of LS. When S3 is selected, the file is written in the 3rd tandem of LS.
 - Create the driver data of the loadable device directly under the USB memory route.
2. Connect the USB memory [1] to the main body connection port [2].
<In case of 1250/1250P/1052>

<In case of 951>

3. Enter the service mode.
4. "Service Mode Menu screen"
Press [10 ISW].
5. "ISW Menu screen"
Press [01 ISW].
6. "ISW mode screen"
Press [USB Memory ISW] and confirm that the message "Connection of a USB memory has been recognized." is displayed, then press the button that corresponds to the firmware to be rewritten.

7. Example: <Image Control> Collective (I0)
The file in the USB memory applicable folder is displayed. (Maximum 24 files)
Select the version of the file to be rewritten, and press [OK].

Note

- From the file name, the file availability is judged and the result is shown by text color.
White: File effective as ISW.
Yellow: Special ROM file.

Red: File other than ISW or file for different destination.

- Press [Limit] to display only the effective files. Press [File Name], [Date] or [Size (byte)] to sort the files by that order.

8. "External Memory Device ISW Mode" screen

Check the type and name of file to conduct ISW, and press [Start].

Note

- Press [File Select] to return to the file name selection screen.
- Press [ROM Selection] to return to the board type selection screen.

9. The following screen is displayed when ISW is completed.

10. Press [Continue] when conducting the ISW successively.

To end the ISW, pull out the USB memory from the connection port, then press [End].

By pressing [No], the machine restarts automatically.

11. Check the firmware version in the service mode to see if the ISW is completed successfully.

(3) Main body error list

When an error occurs while in the execution of the Internet ISW, an error code is displayed on the operation panel. (Refer to [J.1.5 Error list](#))

3.2 ISW Procedure of GP-502

3.2.1 Procedure of rewriting M1

1. Save the firmware to the USB memory in the following folder structure.

Note

- Create the **PRESS_M1250** folder directly under the USB memory route.
- Several firmware can be saved to a folder. However 24 files is the maximum it can display on the touch panel. Also, 2 byte font cannot be displayed.

- **Maximum 40 letters for a file name.**
- **The folder structure is common to 1250P/1052/951.**

- Turn ON the sub power switch (SW2) of the main body, and connect the USB memory [1] to the connecting port [2] on the main body.
<For 1250/1250P/1052>

<For 951>

- Enter the service mode.
- "Service Mode Menu screen"
Press [10 ISW].
- "ISW Menu screen"
Press [01 ISW].
- "ISW mode screen"
Press [USB Memory ISW], confirm that the message "Connection of a USB memory has been recognized." is displayed, and then press [M1] [1].

[1]

- The file in the USB memory applicable folder is displayed. (Maximum 24 files)
Select the version of the file to be rewritten, and press [OK].

Note

- **From the file name, the file availability is judged and the result is shown by text color.**
White: File effective as ISW.

Yellow: Special ROM file.

Red: File other than ISW or file for different destination.

- Press [Limit] to display only the effective files. Press [File Name], [Date] or [Size (byte)] to sort the files by that order.

8. "External Memory Device ISW Mode" screen

Check the type and name of file to conduct ISW, and press [Start].

Note

- Press [File Select] to return to the file name selection screen.
- Press [ROM Selection] to return to the board type selection screen.

9. ISW is executed.

Note

- Do not turn OFF the main power while ISW is being executed.
- Do not press any keys or buttons on the operation panel while ISW is being executed.

10. The following screen is displayed when ISW is completed.

11. Remove the USB memory from the connection port, and press [No].

By pressing [No], the machine restarts automatically.

Note

- Press [No] when conducting the ISW of M2 successively.

12. Check the firmware version in the service mode to see if the ISW is completed successfully.

3.2.2 Procedure of rewriting M2

1. After rebooting the main body, connect the USB memory [1] to the connecting port [2] on the main body.
<For 1250/1250P/1052>

<For 951>

2. Enter the service mode.
3. "Service Mode Menu screen"
Press [10 ISW].
4. "ISW Menu screen"
Press [01 ISW].
5. "ISW mode screen"
Press [USB Memory ISW], confirm that the message "Connection of a USB memory has been recognized." is displayed, and then press [M2] [1].

[1]

6. The file in the USB memory applicable folder is displayed. (Maximum 24 files)
Select the version of the file to be rewritten, and press [OK].

Note

- From the file name, the file availability is judged and the result is shown by text color.
White: File effective as ISW.
Yellow: Special ROM file.
Red: File other than ISW or file for different destination.
- Press [Limit] to display only the effective files. Press [File Name], [Date] or [Size (byte)] to sort the files by that order.

7. "External Memory Device ISW Mode" screen
Check the type and name of file to conduct ISW, and press [Start].

Note

- Press [File Select] to return to the file name selection screen.
- Press [ROM Selection] to return to the board type selection screen.

8. ISW is executed.

Note

- Do not turn OFF the main power while ISW is being executed.
- Do not press any keys or buttons on the operation panel while ISW is being executed.

9. The following screen is displayed when ISW is completed.

NOTE

- When the error code "E0" is displayed, turn OFF the main power. After solving the error, repeat the procedure from the step 1. (Refer to [J.1.5 Error list](#))

10. Remove the USB memory from the connection port, and press [No].
By pressing [No], the machine restarts automatically.

Note

- Press [No] when conducting the ISW of M3 successively.

11. After the main body is rebooted, the following screen is displayed on the operation panel of GP-502. This screen is displayed for 1 minute or 2 minutes.

**Note**

- Do not turn OFF the main power while the screen is displayed.
- Do not press any keys or buttons on the operation panel while the screen is displayed.
- If any keys or buttons on the operation panel is pressed, repeat the procedure from the step 1.

12. Confirm that the operation panel of GP-502 is changed to the following screen, and turn ON/OFF the sub power switch (SW2).

13. After rebooting the main body, check the firmware version in the service mode to see whether the ISW is completed successfully.

3.2.3 Procedure of rewriting M3

1. After the main body is rebooted, connect the USB memory [1] to the connecting port [2] on the main body.
<For 1250/1250P/1052>

<For 951>

2. Enter the service mode.
3. "Service Mode Menu screen"
Press [10 ISW].
4. "ISW Menu screen"
Press [01 ISW].
5. "ISW mode screen"
Press [USB Memory ISW], confirm that the message "Connection of a USB memory has been recognized." is displayed, and then press [M3] [1].

[1]

6. The file in the USB memory applicable folder is displayed. (Maximum 24 files)
Select the version of the file to be rewritten, and press [OK].

Note

- From the file name, the file availability is judged and the result is shown by text color.
White: File effective as ISW.
Yellow: Special ROM file.
Red: File other than ISW or file for different destination.
- Press [Limit] to display only the effective files. Press [File Name], [Date] or [Size (byte)] to sort the files by that order.

7. "External Memory Device ISW Mode" screen
Check the type and name of file to conduct ISW, and press [Start].

Note

- Press [File Select] to return to the file name selection screen.
- Press [ROM Selection] to return to the board type selection screen.

8. ISW is executed.

Note

- Do not turn OFF the main power while ISW is being executed.
- Do not press any keys or buttons on the operation panel while ISW is being executed.

9. The following screen is displayed when ISW is completed.

**NOTE**

- When the error code "E0" is displayed, turn OFF the main power. After solving the error, repeat the procedure from the step 1. (Refer to [J.1.5 Error list](#))

10. Remove the USB memory from the connection port, and press [No].

By pressing [No], the machine restarts automatically.

11. After the main body is rebooted, the following screen is displayed on the operation panel of GP-502. This screen is displayed for 1 minute or 2 minutes.

**Note**

- Do not turn OFF the main power while the screen is displayed.
- Do not press any keys or buttons on the operation panel while the screen is displayed.
- If any keys or buttons on the operation panel is pressed, repeat the procedure from the step 1.

12. Confirm that the operation panel of GP-502 is changed to the following screen, and turn ON/OFF the sub power switch (SW2).

13. After rebooting the main body, check the firmware version in the service mode to see whether the ISW is completed successfully.

3.3 Boot USB memory ISW

(1) Board to be rewritten and firmware

Item	Specifications	
Board to be rewritten	Overall control board (OACB)	
Rewritable firmware	Image control	Batch rewrite (I0)

(2) Procedure

1. Save the firmware to the USB memory in the following folder structure.

- Note**
- Create the PRESS_M1250 folder directly under the USB memory route.
 - The file name is recover.bin.

2. Start the main body.
3. "Start screen"
- The power save LED blinks in orange displaying "PLEASE WAIT STARTING SYSTEM" on the touch panel.
4. Connect the USB memory [1] to the main body service port [2] and ISW starts automatically.
- The condition of the process can be checked according to the status of the power save LED.
- Lighting in green: Reading file from USB memory/Deleting flash
 - Blinks in green: Writing

- Note**
- When the power save LED starts blinking in green, the USB memory can be pulled out from the service port.
- <In case of 1250/1250P/1052>

<In case of 951>

5. The main body automatically restarts when ISW finishes.
6. Check the firmware version in the service mode to see if the ISW is completed successfully.

4. INTERNET ISW

4.1 Outline

"Internet ISW" is a system to operate the ISW by the main body automatically receiving firmware from the program server, using Web browser, main body operation panel, or Internet mail (E-mail) to direct the ISW. ISW can be operated at the customer facility without carrying the program by using the Internet ISW from the main body operation panel or Web browser.

4.2 Operating environment

To use the Internet ISW function, the following conditions must to be met.

- The main body must be connected to the network environment that allows the download of firmware from the Internet by using ftp or http protocol.

In the following 9 cases, the "Internet ISW" does not operate on the main body.

- When the main power switch (SW1) is off
- When the sub power switch (SW2) is off
- The copier is in the auto shut-off mode.
- When the "Security Strengthen Set" is set to ON (The main body NIC other than the CS Remote Care cannot be used)
- During print operation, or various JOB (including reserve JOB) exists, or suspended JOB exists during main body idling.
- Using modes other than normal mode.
- Paper JAM has occurred.
- Image file exists in the image memory.
- Program type, board do not match.

4.3 Initialization

To make use of the Internet ISW, it is necessary to set in advance the network parameter, program server address, the fire wall address and so on, of the main body.

(1) Setting from the operation panel

To introduce the copier main body into the network, set the IP address of the copier from the operation panel.

[J.4.3.\(2\) Setting from the Web browser](#) When this setting has been already made, proceed to

(a) Procedure

1. Press [Utility/Counter] on the operation panel.
2. Press [06 Administrator Setting].
3. Press [04 Network Setting].
4. Press [01 Machine NIC Setting].
5. Press [01 TCP/IP Setting].
6. Enter "IP Address," "Subnet Mask," and "Gateway Address".
7. Turn OFF and ON the sub power switch (SW2) to restart the main body.

Note

- The system administrator normally assigns the IP address of the copier. For details, contact the system administrator.

(2) Setting from the Web browser

Enter the setting of the program server from the Web browser. At this time, in order to use the Web browser, make preparations of the PC that can be introduced into the network.

Note

- No "space" is allowed in all set items.
- When an incorrect setting is made on the Web browser, be sure to correct it following the error message. When no correction of input error is made, program download error occurs.

(a) Procedure

1. Start up the Web browser.
When the proxy is set on the Web browser, it becomes unavailable to access the main body Web.
For particulars, contact the network administrator. Be sure to avoid setting from 2 or more browsers at a time.
2. Specify the IP address of the main body that is entered thorough [J.4.3.\(1\) Setting from the operation panel](#).
Access the Web Utilities of the main body to display the "Main page screen".

Web Utilities

- [Remote Panel](#)
- [Remote Monitor](#)
- [Multi Monitor](#)

- [Machine Manager Setting](#)
- [Extension for maintenance](#)

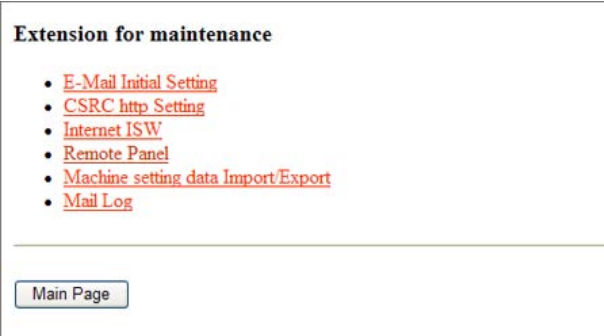

3. "Main page screen"
Click [Extension for maintenance].
4. Enter the user name and the CE password in the "Extension for maintenance" and then press [OK].
User name: ce (small letter, cannot be changed)

Password: Enter the CE password. (Default: "92729272")

5. "Extension for maintenance screen"
Click [Internet ISW].

6. "Internet ISW screen"
Click [Initial Setting].

7. "Proxy Server Setting screen"
Set the proxy server.
When using no proxy server (fire wall), proceed to the step 9.

Enable Proxy	When using no proxy: "Connect to the program server." When using ftp proxy: "Use ftp proxy." When using ftp proxy: "Use ftp proxy." Select from the above.
Proxy Server Type	When selecting "Use ftp proxy" in "Enable Proxy", select the Proxy Server Type from the followings. Type1: "User user@host name" Type2: "OPEN host name" Type 3: FW user => FW password => SITE host name Type 4: "FW user name => FW password => User user@host" Note Types 2, 3 and 4 are unsupported. For authentication of proxy server, refer to "J.4.7 Authentication of the proxy server in Internet ISW"
Proxy Server IP Address	When using the proxy server, set the IP address of the proxy server.
Port Number	When using the proxy server, set the number of the port that uses the proxy server.
User name on the Proxy Server	When selecting the type1 or type2 in "Type of proxy server" shown above, set the account of the proxy server.
Password for the Proxy Server	When selecting the type 1 or type 2 in "Type of proxy server" above set the password of the proxy server.

8. After completion of entry, click [Next] and then after checking the set items in the setting check screen, click [Next]. However, if there is an input error, follow the message shown in red and click [Back] to re-set the item.

9. "Program Server Setting screen"

Set the program server. (When using the proxy)

Program Server Setting

Program Server Address: ftp://211.15.51.157/EUR/C6500/ (Maximum: 100 Characters)

User name on the program server: user (Maximum: 20 Characters)

Password for the program server: ***** (Maximum: 20 Characters)

Receiving time out: 10 minute (Minimum: 1 minute, Maximum: 60 minutes)

[Next]

Program server address	Set the address of the server into which the program to download is stored. Select the protocol to be used from the pull-down menu on the left and enter the following address in the text box on the right. In the case of ftp, it is a relative path from the home directory.
User name on the Program Server	Enter the account name of the program server.
Password for the Program Server	Enter the password of the program server.
Receiving time out	Set the receiving time-out of the program. When the time is out, the download of the program forcibly comes to an end, and the system returns to the normal mode without conducting the ISW.

10. After completion of entry, click [Next]. Then after checking the set items in the setting check screen, click [Completed].

However, if there is an input error, follow the message shown in red and click [Back] to re-set the item.

11. Set the program server. (When not using the proxy)

Protocol	Select the protocol that receives the program.
Program Server IP Address	Set the IP address of the server into which the program to be down loaded is stored.
Target directory	In the case of http, set the path after the host domain. In the case of ftp, set the relative path from the home directory.
User name on the Program Server	Enter the account name of the program server.
Password for the Program Server	Enter the password of the program server.
Receiving time out	Set the receiving time-out of the program. When the time is out, the download of the firmware forcibly comes to an end, and the system returns to the normal mode without conducting the ISW.

12. After completion of entry, click [Next]. Then after checking the set items in the setting check screen, click [Complete]. However, if there is an input error, follow the message shown in red and click [Back] to re-set the item.

13. Conduct the Download test.

- In the down load test, "test.dat" is down loaded from the program server set in the initialization to check the settings. When the download test failed, recheck the set items following the error message.
- When the download test is successfully completed, the communication speed and the expected download time are displayed as following. Refer to this information to set the "Receiving time out".

Download test

No Problem was found while downloading

Estimated line speed 6501584(bps)

Receiving data size	Estimated receiving time
1M byte	0 minute 1 second
3M byte	0 minute 3 second
5M byte	0 minute 6 second
7M byte	0 minute 8 second

[Back]

- When the download test failed, the response error code from the server is display as following. Since it may be because of a setting error, recheck the initialization.

Download test

Can't download from program server
Response Error Code from server [530]

Please change the initial setting accordingly

[Initial Setting]

[Back]

4.4 Internet ISW using the Web Utilities

Using the Web Utilities of the main body allows, by just making a click from the browser, to download the programs from the program server automatically for rewriting.

(1) Procedure

1. Proceed to "Internet ISW" on the Web Utilities.
"Internet ISW screen"

The firmware version of the present board is displayed beside each of the board types.

ISW

Please select board type

Image Control	Collective	I1	A4EU0Y0-001-F00-5700	I2	A4EU0Y0-002-F00-5600	I3	A4EU001-003-F00-5600
Image T		T1	A4EU0Y0-004-F00-0000	T2	A4EU0Y0-005-F00-0000		
Web Browser		W1	A4EU0Y0-00T1-F00-0000				
Printer Control	Collective	C1	A4EU0Y0-00C1-F00-0400	C2	A4EU0Y0-00C2-F00-0200		
ADF		F1	A0HG0Y2-00F1-F00-0000				
IC Control		I2	A4EU001-00P1-F00-5400				
Stapler		N					
Staple Unit		K					
Multi Pricker		G					
Ring Binder		M1		M2		M3	
Stacker		S1		S2		S3	
RU		R1		R2	A4FC0Y0-00R2-F00-0200		
Main Folder		H					
Back Folder		B					
Perfect Binder		P1	A15X0Y0-00J1-G00-30				

File name: _____ (Maximum: 25 Characters)
[ISW]

2. Select one ISW intended board at the item of "ISW". When specifying a firmware file name to be download, enter it in the [File name] text box.

ISW

Please select board type

Image Control	Collective	I1	A4EU0Y0-001-F00-5700	I2	A4EU0Y0-002-F00-5600	I3	A4EU001-003-F00-5600
Image T		T1	A4EU0Y0-004-F00-0000	T2	A4EU0Y0-005-F00-0000

Stacker		S1		S2		S3	
RU		R1		R2	A4FC0Y0-00R2-F00-0200		
Main Folder		H					
Back Folder		B					
Perfect Binder		P1	A15X0Y0-00J1-G00-30				

File name: _____ (Maximum: 25 Characters)
[ISW]

When specifying no firmware name, the following files stored in the program server are rewritten.

I0	bootI0.bin
I1	bootI1.bin
I2	bootI2.bin
I3	bootI3.bin
I4	bootI4.bin
I5	bootI5.bin
T 1	bootT1.bin
W1	bootW1.bin
C0	bootC0.bin
C1	bootC1.bin
C2	bootC2.bin
F1	bootF1.bin
F2	bootF2.bin
H1	bootH1.bin
N1	bootN1.bin
B1	bootB1.bin
K1	bootK1.bin
S1	bootS1.bin
S2	bootS2.bin
J1	bootJ1.bin
R1	bootR1.bin
R2	bootR2.bin
G1	(Not used)
Z1	bootZ1.bin
M1	(Not used)
M2	(Not used)
M3	(Not used)
P 1	bootP1.bin

Note

- bootF1.bin is for FS-532 connected to 1250/1250P/1051 and bootF2.bin is for FS-532 connected to 951.
bootS1.bin is for LS (1st tandem) and bootS2.bin is for LS (2nd tandem).
bootR1.bin is for RU-509 and bootR2.bin is for RU-510.

3. After completion of entry, click the [ISW].
If there is an input error, follow the message shown in red and click [Back] to enter the item again.

4. Checking of the ISW conditions.

The power save LED lights in green during downloading the program. From the Web screen, check the current processing condition to see if there is any error.

- "ISW in communication"
- "ISW in rewriting" "Completed successfully":
- "Completed normally": Be sure to avoid pressing the "Read again" key of the browser to reboot after successful completion.
- "Aborted due to a communication error."
- "Aborted due to a communication time error."
- "Aborted due to a writing error."

5. When ISW is completed normally, the main body automatically restarts and completes ISW.

6. After restart of the main body, check the firmware version in "Internet ISW main screen" to see if it is being updated successfully.

4.5 Usage precautions

4.5.1 Notice to administrator

When conducting the Internet ISW, be sure to notify the administrator of it and get approval from administrator in advance.

Be sure to execute ISW with the main body not used. However, when the main body is in use (jobs present), the Internet ISW does not operate.

4.5.2 Power cut during writing

While in the ISW rewrite, the operation panel and the power switch (SW2) are locked. However, when the main power source is turned off due to power cut etc., the main body cannot start up.

However, this is a problem encountered while in the overall control board (OACB) rewrite. As for other errors while in the ISW, they can be rewritten by the Internet ISW again.

Should the main body be not able to start due to the reason above, go to the actual place and use Boot USB memory ISW to conduct the rewrite of the program.

4.6 Internet ISW using the operation panel

(1) Procedure

Example: When rewrite the overall control board (OACB) firmware (ALL).

1. Display "ISW mode screen".

2. Press the [Internet ISW] on the screen and then press the [Collective(I0)] of <Image Control>.

3. Press the [Start] and download the latest firmware to start the rewrite.

In a case in which the download of an old version firmware is required, press the [File Name Input] and enter the file name manually.

4. The following screen is displayed when ISW is completed.

5. Press [Continue] when conducting the ISW successively.
To end the ISW, press [End].
The main body automatically restarts when [End] is pressed.
6. Check the firmware version in the service mode to see if the ISW is completed successfully.

(2) Main body error list

When an error occurs while in the execution of the Internet ISW, an error code is displayed on the operation panel. (Refer to [J.1.5 Error list](#))

4.7 Authentication of the proxy server in Internet ISW

(1) Proxy server

Proxy server which is provided on the inside of the fire wall is the generic name of a mail server that serves the proxy of a client who receives an access demand (HTTP and FTP) from the client.

(2) Authentication of the proxy server

There are 4 types of authentication methods for the proxy server.
The Internet ISW is corresponding to these 4 types.

(3) Authentication type of the proxy server and the command list

(a) Type1: User user name@host name

When accessing the outside through the proxy, authentication to the proxy server is not required.
When accessing the outside through the proxy server, or when the entry of the user name and password of the proxy server is not required, this proxy authentication is likely to be used.
Command

Command	Parameter	Reply Code	Description
---------	-----------	------------	-------------

USER	User name@host name	331	Transmit the user name of the program server and the program server address
PASS	Password	230	Transmit the password for the user name above

(b) Type2: OPEN host name

This process is almost the same as the type1, except for the exchange of commands while in authentication.

When all the settings are made correctly and no communication is available with type 1 authentication, apply this type.

Command

Command	Parameter	Reply Code	Description
OPEN	Host name	ftp expanded function, defined for each server	Transmit the user name of the program server
USER	User name	331	Transmit the user name of the program server
PASS	Password	230	Transmit the password for the user name above

(c) Type 3: FW user => FW password => SITE host name

This is a type that requires the authentication to the proxy server itself when accessing the outside.

The information of the server you want to access, the user name and password of the proxy server (F/W) are necessary. In the case of the user name and the password of the proxy server are required when accessing the outside through the proxy server, this proxy authentication is likely to be used.

Command

Command	Parameter	Reply Code	Description
USER	FW user	331	Transmit the user name of the proxy server
PASS	FW password	230	Transmit the password for the user name above
SITE	Host name	ftp expanded function, defined for each server	Transmit the user name of the program server
USER	User name	331	Transmit the user name of the program server
PASS	Password	230	Transmit the password for the user name above

(d) Type 4: FW user => FW password => USER user@host

This process is almost the same as the type3, except for the exchange of commands while in authentication.

When all the settings are made correctly and no communication is available with type 3 authentication, apply this type.

Command

Command	Parameter	Reply Code	Description
USER	FW user name	331	Transmit the user name of the proxy server
PASS	FW password	230	Transmit the password for the user name above
USER	User name@host name	331	Transmit the user name of the program server and the program server address
PASS	Password	230	Transmit the password for the user name above

(4) Remark

For fwtk2.1 (for Unix) and Black Jumbo Dog (for Windows), the type1 authentication is used. For most of the proxy servers, the type 1 authentication is used. When the authentication type of the proxy server is not known, you are recommended to make settings in type1 authentication as a temporary measure.

K TROUBLESHOOTING

1. JAM INDICATION

1.1 Jam code list

Classification	JAM Code	Cause	Resulting operation	Correction
Tray1	J-1101	During operation: The paper feed sensor /1 (PS7) does not turn ON within a specified period of time after the paper feed clutch /1 (CL4) turns ON.	If there is a sheet of paper being printed when a jam occurs, the main body completes the paper exit before stopping operations.	Pull out tray /1 and remove jammed paper if any.
	J-1102	The pre-registration sensor /1 (PS17) does not turn ON within a specified period of time after the paper feed clutch /1 (CL4) turns ON.		Open tray /1 and the main body vertical conveyance door, and remove jammed paper if any.
	J-1103	During operation: The vertical conveyance sensor /1 (PS19) does not turn ON within a specified period of time after the pre-registration sensor (PS17) turns ON.		Open tray /1 and the main body vertical conveyance door, and remove jammed paper if any.
	J-1104	During operation: When the trailing edge of paper is passing through the vertical conveyance sensor /1 (PS19), the pre-registration sensor /1 (PS17) is turned ON by the succeeding paper.	After completion of the exit of the preceding paper, the main body stops operations.	Open tray /1 and the main body vertical conveyance door, and remove jammed paper if any.
	J-1151	When idling: The vertical conveyance sensor /1 (PS19) turns ON while in idling.	-	Open the main body vertical conveyance door and remove jammed paper if any.
	J-1152	When idling: The pre-registration sensor /1 (PS17) turns ON while in idling.		Pull out tray /1 and remove jammed paper if any.
Tray2	J-1201	During operation: The paper feed sensor /2 (PS11) does not turn ON within a specified period of time after the paper feed clutch /2 (CL6) turns ON.	If there is a sheet of paper being printed when a jam occurs, the main body completes the paper exit before stopping operations.	Pull out tray /2 and remove jammed paper if any.
	J-1202	During operation: The pre-registration sensor /2 (PS18) does not turn ON within a specified period of time after the paper feed clutch /2 (CL6) turns ON.		Open tray2 and the main body vertical conveyance door, and remove jammed paper if any.
	J-1203	During operation: The pre-registration sensor /3 (PS21) does not turn ON within a specified period of time after the paper feed clutch /2 (PS18) turns ON.		Open tray2 and the main body vertical conveyance door, and remove jammed paper if any.
	J-1204	During operation: When the trailing edge of paper is passing through the vertical conveyance sensor /3 (PS21), the pre-registration sensor /2 (PS18) is turned ON by the succeeding paper.	After completion of the exit of the preceding paper, the main body stops operations.	Open tray2 and the main body vertical conveyance door, and remove jammed paper if any.
	J-1251	When idling: The vertical conveyance sensor /3 (PS21) turns ON while in idling.	-	Open the main body vertical conveyance door and remove jammed paper if any.
	J-1252	When idling: The pre-registration sensor /2 (PS18) turns ON while in idling.		Pull out tray /2 and remove jammed paper if any.
Tray3 (PFU1)	J-1301	During operation: PF-703 The paper feed sensor /1 (PS2) does not turn ON within a specified period of time after the paper feed clutch /1 (CL7) turns ON. (PF-706) The paper feed sensor /1 (PS3) does not turn ON within a specified period of time after the paper feed clutch /1 (CL6) turns ON.	If there is a sheet of paper being printed when a jam occurs, the main body completes the paper exit before stopping operations.	Pull out tray /3 and remove jammed paper if any.
LU	J-1301	During operation: The pre-registration sensor (PS107) does not turn ON within a specified period of time after the paper feed clutch (CL101) turns ON.		Open the LU upper cover and remove jammed paper if any. Open the LU jam door and remove jammed paper if any.
Tray3 (PFU1)	J-1302	During operation: (PF-703) The pre-registration sensor /1 (PS14) does not turn ON within a specified period of time after the paper feed clutch /1 (CL7) turns ON. (PF-706) The pre-registration sensor /1 (PS14) does not turn ON within a specified period of time after the paper feed clutch /1 (CL6) turns ON.		Open tray /3, the PF front door and the vertical conveyance door /Up, and remove jammed paper if any.

Classification	JAM Code	Cause	Resulting operation	Correction
LU	J-1302	During operation: The LU exit sensor (PS106) does not turn ON within a specified period of time after the pre-registration clutch (CL102) turns ON.		Open the LU upper cover and remove jammed paper if any. Open the LU jam door and remove jammed paper if any.
Tray3 (PFU1)	J-1303	During operation: (PF-703/706) The vertical conveyance sensor /1 (PS15) does not turn ON within a specified period of time after the pre-registration sensor /1 (PS14) turns ON.		Open tray /3, the PF front door and the vertical conveyance door /Up, and remove jammed paper if any.
	J-1304	During operation: (PF-703/706) When the trailing edge of paper is passing through the vertical conveyance sensor /1 (PS15), the pre-registration sensor /1 (PS14) is turned ON by the succeeding paper.		Open tray /3, the PF front door and the vertical conveyance door /Up, and remove jammed paper if any.
LU	J-1304	During operation: When the trailing edge of paper is passing through the LU exit sensor (PS106), the pre-registration sensor (PS107) is turned ON by the succeeding paper.	If there is a sheet of paper being printed when a jam occurs, the main body completes the paper exit before stopping operations.	Open the LU upper cover and remove jammed paper if any. Open the LU jam door and remove jammed paper if any.
Tray3 (PFU1)	J-1305	During operation: PF-703 The paper suction sensor Fr/1 (PS25) and the paper suction sensor /Rr1(PS26) do not turn ON within a specified period of time from the rotation stabilization standby (3sec) after the paper suction fan /1 (FM13) and the paper suction fan /2 (FM14) turn ON.		Pull out tray /3 and remove jammed paper if any.
	J-1351	When idling: (PF-703/706) The pre-registration sensor /1 (PS14) turns ON while in idling.		Pull out tray /3 and remove jammed paper if any.
LU	J-1351	When idling: The LU exit sensor (PS106) turns ON while in idling.	If there is a sheet of paper being printed when a jam occurs, the main body completes the paper exit before stopping operations.	Open the LU upper cover and remove jammed paper if any. Open the LU jam door and remove jammed paper if any.
Tray3 (PFU1)	J-1352	When idling: (PF-703/706) The vertical conveyance sensor /1 (PS15) turns ON while in idling.		Open the PF front door and the vertical conveyance door /Up and remove jammed paper if any.
LU	J-1352	When idling: The pre-registration sensor (PS107) turns ON while in idling.		Open the LU upper cover and remove jammed paper if any. Open the LU jam door and remove jammed paper if any.
Tray4 (PFU1)	J-1401	During operation: PF-703 The paper feed sensor /2 (PS6) does not turn ON within a specified period of time after the paper feed clutch /2 (CL8) turns ON. (PF-706) The paper feed sensor /2 (PS7) does not turn ON within a specified period of time after the paper feed clutch /2 (CL9) turns ON.	If there is a sheet of paper being printed when a jam occurs, the main body completes the paper exit before stopping operations.	Pull out tray /4 and remove jammed paper if any.
	J-1402	During operation: PF-703 The pre-registration sensor /2 (PS18) does not turn ON within a specified period of time after the paper feed clutch /2 (CL8) turns ON. (PF-706) The pre-registration sensor /2 (PS18) does not turn ON within a specified period of time after the paper feed clutch /2 (CL9) turns ON.		Open tray /4, the PF front door and the horizontal conveyance jam release lever and remove jammed paper if any.
	J-1403	During operation: (PF-703/706) When the trailing edge of paper is passing through the loop sensor /2 (PS19), the pre-registration sensor /2 (PS18) is turned ON by the succeeding paper.		Open tray /4, the PF front door and the horizontal conveyance jam release lever and remove jammed paper if any.

Classification	JAM Code	Cause	Resulting operation	Correction
	J-1405	During operation: PF-703 The paper suction sensor /Fr3 (PS27) and the paper suction sensor /Rr2(PS28) do not turn ON within a specified period of time from the rotation stabilization standby (3sec) after the paper suction fan /3 (FM15) and the paper suction fan /4 (FM16) turn ON.		Pull out tray /4 and remove jammed paper if any.
	J-1451	When idling: (PF-703/706) The pre-registration sensor /2 (PS18) turns ON while in idling.	-	Pull out tray /4 and remove jammed paper if any.
Tray5 (PFU1)	J-1501	During operation: PF-703 The paper feed sensor /3 (PS10) does not turn ON within a specified period of time after the paper feed clutch /3 (CL9) turns ON. (PF-706) The paper feed sensor /3 (PS11) does not turn ON within a specified period of time after the paper feed clutch /3 (CL12) turns ON.	If there is a sheet of paper being printed when a jam occurs, the main body completes the paper exit before stopping operations.	Pull out tray /5 and remove jammed paper if any.
	J-1502	During operation: PF-703 The pre-registration sensor /3 (PS20) does not turn ON within a specified period of time after the paper feed clutch /3 (CL9) turns ON. (PF-706) The pre-registration sensor /3 (PS20) does not turn ON within a specified period of time after the paper feed clutch /3 (CL12) turns ON.		Open tray /5, the PF front door and the vertical conveyance door /Lw, and remove jammed paper if any.
	J-1503	During operation: PF-703 The vertical conveyance sensor /3 (PS21) does not turn ON within a specified period of time after the pre-registration sensor /3 (PS20) turns ON. (PF-706) The vertical conveyance sensor /2 (PS21) does not turn ON within a specified period of time after the pre-registration sensor /3 (PS20) turns ON.		Open tray /5, the PF front door and the vertical conveyance door /Lw, and remove jammed paper if any.
	J-1504	During operation: PF-703 When the trailing edge of paper is passing through the vertical conveyance sensor /3 (PS21), the pre-registration sensor /3 (PS20) is turned ON by the succeeding paper. (PF-706) When the trailing edge of paper is passing through the vertical conveyance sensor /2 (PS21), the pre-registration sensor /3 (PS20) is turned ON by the succeeding paper.	After completion of the exit of the preceding paper, the main body stops operations.	Open tray /5, the PF front door and the vertical conveyance door /Lw, and remove jammed paper if any.
	J-1505	During operation: (PF-703) The paper suction sensor /Fr3 (PS29) and the paper suction sensor /Rr3 (PS30) do not turn ON within a specified period of time from the rotation stabilization standby (3sec) after the paper suction fan /5 (FM17) and the paper suction fan /6 (FM18) turn ON.	If there is a sheet of paper being printed when a jam occurs, the main body completes the paper exit before stopping operations.	Pull out tray /5 and remove jammed paper if any.
	J-1551	When idling: (PF-703/706) The pre-registration sensor /3 (PS20) turns ON while in idling.	-	Pull out tray /5 and remove jammed paper if any.
	J-1552	When idling: PF-703 The vertical conveyance sensor /3 (PS21) turns ON while in idling. (PF-706) The vertical conveyance sensor /2 (PS21) turns ON while in idling.		Open the PF front door and the vertical conveyance door /Lw and remove jammed paper if any.

	J-3111	During operation: 1.0% or 0.5% of the skew is detected by the paper skew sensor /Fr (PS65), the paper skew sensor /Rr (PS66).(PRO 951 is unimplemented)	If there is a sheet of paper being printed when a jam occurs, the main body completes the paper exit before stopping operations.	Open the main body front doors / R and /L, pull out the duplex section and remove jammed paper if any.
	J-3112	During operation: Centering of 5mm or more is detected by the centering sensor (PS4)		Open the main body front doors / R and /L, pull out the duplex section and remove jammed paper if any.
	J-3201	During operation: The de-curler entrance solenoid (PS23) does not turn ON within a specified period of time after the fusing exit sensor (PS22) turns ON.		Open the main body front doors / R and /L, pull out the duplex section and remove jammed paper if any.
	J-3202	During operation: While in the straight paper exit, the paper exit sensor (PS3) does not turn ON within a specified period of time after the de-curler entrance solenoid (PS23) turns ON.		Open the main body front doors / R and /L, pull out the duplex section and remove jammed paper if any.
	J-3203	During operation: ADU accelerate sensor (PS49) does not turn ON within a specified period of time after the fusing exit sensor (PS22) turns ON.		Open the main body front doors / R and /L, pull out the duplex section and remove jammed paper if any.
	J-3204	During operation: The reverse sensor /1 (PS48) does not turn ON within a specified period of time after the ADU accelerate sensor (PS49) turns ON.		Open the main body front doors / R and /L, pull out the duplex section and remove jammed paper if any.
	J-3205	During operation: The PS48 does not turn ON again within a specified period of time after the reverse sensor /1 (PS48) turns ON.		Open the main body front doors / R and /L, pull out the duplex section and remove jammed paper if any.
	J-3206	During operation: The de-curler entrance solenoid (PS23) does not turn ON within a specified period of time after the reverse sensor /1 (PS48) turns ON.	The main body stops immediately.	Open the main body front doors / R and /L, pull out the duplex section and remove jammed paper if any.
	J-3207	During operation: While in the reverse paper exit, the paper exit sensor (PS3) does not turn ON within a specified period of time after the de-curler entrance solenoid (PS23) turns ON.		Open the main body front doors / R and /L, pull out the duplex section and remove jammed paper if any.
	J-3208	During operation: The PS3 does not turn OFF again within a specified period of time after the paper exit sensor (PS3) turns ON.		Open the main body front doors / R and /L, pull out the duplex section and remove jammed paper if any.
	J-3251	When idling: The fusing exit sensor (PS22) turns ON while in idling.		Open the main body front doors / R and /L, pull out the duplex section and remove jammed paper if any.
	J-3252	When idling: The paper exit sensor (PS3) turns ON while in idling.		Open the main body front doors / R and /L, pull out the duplex section and remove jammed paper if any.
	J-3253	When idling: The ADU accelerate sensor (PS49) turns ON while in idling.		Open the main body front doors / R and /L, pull out the duplex section and remove jammed paper if any.

Classification	JAM Code	Cause	Resulting operation	Correction
	J-3254	When idling: The ADU reverse paper exit sensor (PS50) turns ON while in idling.		Open the main body front doors / R and /L, pull out the duplex section and remove jammed paper if any.
	J-3255	When idling: The fusing jam sensor (PS38) turns ON while in idling.		Open the main body front doors / R and /L, pull out the duplex section and remove jammed paper if any.
	J-3256	When idling: The reverse sensor /1 (PS48) turns ON while in idling.		Open the main body front doors / R and /L, pull out the duplex section and remove jammed paper if any.
	J-3257	When idling: The reverse sensor /2 (PS47) turns ON while in idling.		Open the main body front doors / R and /L, pull out the duplex section and remove jammed paper if any.
	J-3258	When idling: The de-curler entrance sensor (PS23) turns ON while in idling.		Open the main body front doors / R and /L, pull out the duplex section and remove jammed paper if any.
External	J-5101	During operation: The front door/R, /L of the main body was opened while printing.		Close main body front doors /Rt and /Lt.
	J-5102	During operation: The waste toner BOX got into the unset status while in the print.		Set the waste toner box.
DF	J-6101	During operation: The DF open-close sensor (PS301) turns ON while in operation.	The DF stops immediately. If there is paper being transferred or having been transferred, the main body completes the paper exit before stopping operations.	Close the DF.
	J-6102	During operation: The cover open-close switch (MS301) turns ON while in operation.		Close the DF open-close cover.
	J-6201	During operation: The original registration sensor /Lt (PS306) does not turn OFF within a specified period of time after the pre-feed start.		Open the DF open-close cover and remove jammed paper if any.
	J-6202	During operation: The original conveyance sensor (PS308) does not turn ON within a specified period of time after the pre-feed start of the front side of the double-sided original (including the single-sided original).		Open the DF open-close cover and remove jammed paper if any.
	J-6203	During operation: The original conveyance sensor (PS308) does not turn ON within a specified period of time after the pre-feed start of the back side of the double-sided original.		Open the DF open-close cover and remove jammed paper if any.
	J-6204	During operation: While in the forward rotation of the original conveyance motor (M302), the original conveyance sensor (PS308) does not turn OFF within a specified period of time after it turns ON.		Open the DF open-close cover and remove jammed paper if any.
	J-6205	During operation: While in the reverse rotation of the original conveyance motor (M302), the original conveyance sensor (PS308) does not turn OFF within a specified period of time after it turns ON.		Open the DF open-close cover and remove jammed paper if any.
	J-6206	During operation: When entering a large-size double-sided original in the reverse section, the original reverse sensor (PS309) does not turn ON within a specified period of time after the original conveyance sensor (PS308) turns ON.		Open the DF open-close cover and remove jammed paper if any.
	J-6207	During operation: When exiting a large-size single-sided original, the original exit sensor /Lt (PS307) does not turn ON within a specified period of time after the original conveyance sensor (PS308) turns ON.		Open the DF open-close cover and remove jammed paper if any.
	J-6208	During operation: When exiting a large-size double-sided original, the original exit sensor /Lt (PS307) does not turn ON within a specified period of time after the original reverse sensor (PS309) turns ON.		Open the DF open-close cover and remove jammed paper if any.
	J-6209	During operation: When exiting a large-size single-sided original, the original exit sensor /Lt (PS307) does not turn OFF within a specified period of time after it turns ON.		Open the DF open-close cover and remove jammed paper if any.

Classification	JAM Code	Cause	Resulting operation	Correction
	J-6210	During operation: When exiting a large-size double-sided original, the original exit sensor /Lt (PS307) does not turn OFF within a specified period of time after it turns ON.		Open the DF open-close cover and remove jammed paper if any.
	J-6301	During operation: When outputting a large-size double-sided original from the reverse section, the original reverse sensor (PS309) does not turn ON.		Raise DF, open original glass guide, and remove jammed paper (if any) from DF.
	J-6302	During operation: When entering a large-size double-sided original into the reverse section, the original reverse sensor (PS309) does not turn OFF within a specified period of time after it turns ON.		Raise DF, open original glass guide, and remove jammed paper (if any) from DF.
	J-6303	During operation: When outputting a large-size double-sided original from the reverse section, the original reverse sensor (PS309) does not turn OFF within a specified period of time after it turns ON.		Raise DF, open original glass guide, and remove jammed paper (if any) from DF.
	J-6304	During operation: When exiting a small-size single-sided original, the original exit sensor /Rt (PS314) does not turn ON within a specified period of time after the original reverse sensor (PS309) turns ON.		Raise DF, open original glass guide, and remove jammed paper (if any) from DF.
	J-6305	During operation: When exiting a small-size double-sided original, the original exit sensor /Rt (PS314) does not turn OFF within a specified period of time after the original reverse-exit sensor (PS313) turns ON.		Raise DF, open original glass guide, and remove jammed paper (if any) from DF.
	J-6306	During operation: When exiting a small-size single-sided original, the original exit sensor /Rt (PS314) does not turn OFF within a specified period of time after it turns ON.		Raise DF, open original glass guide, and remove jammed paper (if any) from DF.
	J-6307	During operation: When exiting a small-size double-sided original, the original exit sensor /Rt (PS314) does not turn OFF within a specified period of time after it turns ON.		Raise DF, open original glass guide, and remove jammed paper (if any) from DF.
	J-6308	During operation: When entering a small-size double-sided original in the reverse section, the original reverse-exit sensor (PS313) does not turn ON within a specified period of time after the original conveyance sensor (PS308) turns ON.		Raise DF, open original glass guide, and remove jammed paper (if any) from DF.
	J-6309	During operation: When outputting a small-size double-sided original in the reverse section, the original reverse-exit sensor (PS313) does not turn ON within a specified period of time after the original conveyance sensor (PS308) turns ON.		Raise DF, open original glass guide, and remove jammed paper (if any) from DF.
	J-6310	During operation: When entering a small-size double-sided original into the reverse section, the original reverse-exit sensor (PS313) does not turn OFF within a specified period of time after it turns ON.		Raise DF, open original glass guide, and remove jammed paper (if any) from DF.
	J-6311	During operation: When outputting a small-size double-sided original into the reverse section, the original reverse-exit sensor (PS313) does not turn OFF within a specified period of time after it turns ON.		Raise DF, open original glass guide, and remove jammed paper (if any) from DF.
	J-6501	When idling: The original registration sensor /Lt (PS306) turns ON while in idling.		Open the DF open-close cover and remove jammed paper if any.
	J-6502	When idling: The original conveyance sensor (PS308) turns ON while in idling.		Open the DF open-close cover and remove jammed paper if any.
	J-6504	When idling: The original reverse sensor (PS309) turns ON while in idling.		Raise DF, open original glass guide, and remove jammed paper (if any) from DF.
	J-6508	When idling: The original exit sensor /Lt (PS307) turns ON while in idling.		Open the DF open-close cover and remove jammed paper if any.
	J-6510	When idling: The original reverse-exit sensor (PS313) turns ON while in idling.		Raise DF, open original glass guide, and remove jammed paper (if any) from DF.

Classification	JAM Code	Cause	Resulting operation	Correction
	J-6520	When idling: The original exit sensor /Rt (PS314) turns ON while in idling.		Raise DF, open original glass guide, and remove jammed paper (if any) from DF.
	J-6540	When idling: The reverse jam sensor (PS304) turns ON while in idling.		Raise DF, open original glass guide, and remove jammed paper (if any) from DF.
	J-6580	When idling: The original registration sensor /Rt (PS318) turns ON while in idling. (DF-615 only)		Open the DF open-close cover and remove jammed paper if any.
FS	J-7101	During operation: The FS front door open jam. The door switch (MS1) turns OFF while in printing.	The FS and the main body stop immediately.	Remove jammed paper if any from the FS, the SD and the main body.
RU	J-7102	During operation: (RU-510) The RU front door open jam. The interlock switch (MS1) turns OFF while in the print.	The RU and the main body stop immediately.	Remove jammed paper if any from the RU/main body.
LS (1st tandem)	J-7103	During operation: The LS front door open jam. The door switch (MS1) turns OFF while in printing.	The LS and the main body stop immediately.	Remove jammed paper if any from the LS/main body.
LS (2nd tandem)	J-7104	During operation: The LS front door open jam. The door switch (MS1) turns OFF while in printing.		Remove jammed paper if any from the LS/main body.
FD	J-7105	During operation: The FD front door open jam. The front door switch (MS1) turns OFF while in the print.	The FD and the main body stop immediately.	Remove jammed paper if any from the FD/main body.
SD-506	J-7107	During operation: The SD front door/Rt open jam or the SD front door/Lt open jam. During printing, either the SD front door switch /Rt (MS1) or /Lt (MS2) turns OFF.	The SD and the main body stop immediately.	Remove jammed paper if any from the SD/main body.
PB	J-7108	During operation: The PB front door open jam. During printing, the front door switch (SW2), booklet door switch (SW3), upper door switch (SW1), and relay conveyance section door switch (MS3) turn OFF.	The PB and the main body stop immediately.	Remove jammed paper if any from the PB/main body.
GP-501	J-7109	During operation: The GP front door open jam. The door switch turns OFF while in the print.	The GP and the main body stop immediately.	Remove jammed paper if any from the GP/main body.
RU	J-7110	During operation: (RU-509) The RU front door open jam. The door switch (SW1) turns OFF while in printing.	The RU and the main body stop immediately.	Remove jammed paper if any from the RU/main body.
GP-502	J-7111	During operation: The GP front door open jam. The line Interrupt Interlock switch turns OFF while in the print.	The GP/main body stop immediately.	Remove jammed paper if any from the GP/main body.
LS (3rd tandem)	J-7112	During operation: The LS front door open jam. The door switch (MS1) turns OFF while in printing.	The LS and the main body stop immediately.	Remove jammed paper if any from the LS/main body.
FS	J-7216	During operation: The FNS entrance sensor (PS1) does not turn ON within a specified period of time after the paper exit sensor of the previous option turns ON.	The FS and the main body stop immediately.	Remove jammed paper if any from the FS/main body.
	J-7217	During operation: The main tray paper exit sensor (PS10) does not turn ON within a specified period of time after the FNS entrance sensor (PS1) turns ON.		Remove jammed paper if any from the FS/main body.
	J-7218	During operation: The paper overlap sensor /1 (PS32) does not turn ON within a specified period of time after the FNS entrance sensor (PS1) turns ON.		Remove jammed paper if any from the FS/main body.
	J-7220	During operation: While in stapling a small-size paper, the main tray paper exit sensor (PS10) does not turn ON within a specified period of time after the paper exit operation starts.		Remove jammed paper if any from the FS/main body.
	J-7221	During operation: While in stapling a large-size paper, the main tray paper exit sensor (PS10) does not turn OFF within a specified period of time after the paper exit operation starts.		Remove jammed paper if any from the FS/main body.

Classification	JAM Code	Cause	Resulting operation	Correction
	J-7222	During operation: While in exiting paper in the sub tray, the sub tray exit sensor (PS8) does not turn ON within a specified period of time after the paper exit sensor of the previous option turns ON.		Remove jammed paper if any from the FS/main body.
	J-7223	During operation: While in exiting paper in the sub tray, PS1 does not turn OFF within a specified period of time after the sub tray exit sensor (PS8) turns ON.		Remove jammed paper if any from the FS/main body.
	J-7224	During operation: The stacker rear alignment sensor (PS44) does not turn ON within a specified period of time after the exit of paper bundle is completed. Or, PS44 turns OFF before a specified time since the small size paper alignment motor (M18) starts to excite when the standby position of exiting the paper bundle for the FD alignment plate is being moved.		Remove jammed paper if any from the FS/main body.
SD-510	J-7225	During operation: While in the tri-folding mode, the folding exit sensor (PS113) does not turn ON within a specified period of time after the folding is completed.	The SD and the main body stop immediately.	Remove jammed paper if any from the SD/main body.
	J-7226	During operation: PS113 does not turn OFF within a specified period of time after the folding exit sensor (PS113) turns ON.		Remove jammed paper if any from the SD/main body.
FS	J-7227	During operation: The paper overlap sensor /2 (PS33) does not turn ON within a specified period of time after the stacker entrance motor (M5) starts reverse rotation.	The FS and the main body stop immediately.	Remove jammed paper if any from the FS/main body.
	J-7228	During operation: PS32 does not turn OFF within a specified period of time after the paper overlap sensor /1 (PS32) turns ON.		Remove jammed paper if any from the FS/main body.
	J-7229	During operation: The main tray paper exit sensor (PS10) does not turn OFF within a specified period of time after the FNS entrance sensor (PS1) turns OFF.		Remove jammed paper if any from the FS/main body.
	J-7230	During operation: The main tray paper exit sensor (PS10) does not turn ON within a specified period of time after stapling a small-size paper starts.		Remove jammed paper if any from the FS/main body.
	J-7231	During operation: The paper overlap sensor /2 (PS33) does not turn OFF within a specified period of time after the stacker entrance motor (M5) starts forward rotation. Paper which is 253mm or more in the sub scan direction is not target.		Remove jammed paper if any from the FS/main body.
PI	J-7235	During operation: The paper passage sensor / Lw (PS206) does not turn ON within a specified period of time after the conveyance clutch /Lw (CL202) turns ON. Or, the paper passage sensor /Lw (PS206) does not turn ON within a specified period of time after the paper passage sensor /Up (PS201) turns ON.		Remove jammed paper if any from the FS/main body.
FS	J-7236	During operation: The paper overlap sensor /2 (PS33) does not turn ON within a specified period of time after the FNS entrance sensor (PS1) turns ON.		Remove jammed paper if any from the FS/main body.
SD-510	J-7237	During operation: The SD entrance sensor (PS102) does not turn ON within a specified period of time after the paper overlap sensor /2 (PS33) turns ON.	The SD and the main body stop immediately.	Remove jammed paper if any from the SD/main body.
ZU	J-7238	During operation: The leading/trailing/side edge sensors of the paper edge sensor board (PESB) do not turn ON within a specified period of time after the main body paper exit sensor (PS3) turns ON.	The ZU and the main body stop immediately.	Remove jammed paper if any from the ZU/main body.
	J-7239	During operation: The leading/trailing/side edge sensors of the paper edge sensor board (PESB) do not turn OFF within a specified period of time after they turn ON.		Remove jammed paper if any from the ZU/main body.

Classification	JAM Code	Cause	Resulting operation	Correction
	J-7240	During operation: The conveyance sensor (PS601) does not turn ON within a specified period of time after the leading/trailing/side edge sensors of the paper edge sensor board (PESB) turn ON.		Remove jammed paper if any from the ZU/main body.
	J-7241	During operation: The conveyance sensor (PS601) does not switch from ON to OFF within a specified period of time after the Z-fold mode starts the 2nd folding.		Remove jammed paper if any from the ZU/main body.
	J-7242	During operation: The conveyance sensor (PS601) does not switch from ON to OFF within a specified period of time after the Z-fold mode finishes the 2nd folding.		Remove jammed paper if any from the ZU/main body.
PK	J-7243	During operation: The paper size sensor (PS305) does not detect the paper edge even after a specified period of time has passed after the punch shift motor (M302) turns ON. Or, the punch home sensor /1 (PS301) or /2 (PS307) does not turn ON even after a specified period of time has passed after the punch motor (M301) turns ON.	The FS and the main body stop immediately.	Remove jammed paper if any from the FS/main body.
ZU	J-7244	During operation: The exit sensor (PS609) does not turn ON within a specified period of time after the leading/trailing/side edge sensors of the paper edge sensor board (PESB) turn ON.	The ZU and the main body stop immediately.	Remove jammed paper if any from the ZU/main body.
	J-7245	During operation: The exit sensor (PS609) does not turn ON within a specified period of time after the main body paper exit sensor (PS3) turns ON.		Remove jammed paper if any from the ZU/main body.
	J-7246	During operation: The exit sensor (PS609) does not turn OFF within a specified period of time after the exit sensor (PS609) turns ON.		Remove jammed paper if any from the ZU/main body.
	J-7247	During operation: The paper remains in the Z-fold unit within a specified period of time after the main body transmits the operation stop signal to the Z-fold unit.		Remove jammed paper if any from the ZU/main body.
SD-510	J-7248	During operation: The paper passage sensor / Up (PS201) does not turn ON within a specified period of time after the pick-up solenoid /Up (SD201) turns ON.	The SD and the main body stop immediately.	Remove jammed paper if any from the SD/main body.
PI	J-7249	During operation: The paper passage sensor / Up (PS201) does not turn ON within a specified period of time after the pick-up solenoid /Up (SD201) turns ON.	The FS and the main body stop immediately.	Remove jammed paper if any from the FS/main body.
	J-7250	During operation: The FNS entrance sensor (PS1) does not turn ON within a specified period of time after the paper passage sensor /Up (PS201) turns ON.		Open the PI upper door and remove jammed paper if any.
	J-7251	During operation: The FNS entrance sensor (PS1) does not turn ON within a specified period of time after the paper passage sensor /Lw (PS206) turns ON.		Open the PI upper door and remove jammed paper if any.
ZU	J-7260	During operation: The certain side edge sensor in the paper edge sensor board (PESB) does not turn ON within a specified period of time after the paper turns OFF leading/trailing/side edge sensors of the paper edge sensor board (PESB). Or, the punch home sensor (PS606) does not turn ON within a specified period of time after the punch clutch (CL601) turns ON.	The ZU and the main body stop immediately.	Remove jammed paper if any from the ZU/main body.
	J-7261	During operation: The saddle entrance sensor (PS102) does not turn ON within a specified period of time after the paper overlap sensor /2 (PS33) turns ON.		Remove jammed paper if any from the ZU/main body.
	J-7262	During operation: The exit sensor (PS609) does not turn ON within a specified period of time after the conveyance sensor (PS601) turns ON.		Remove jammed paper if any from the ZU/main body.

Classification	JAM Code	Cause	Resulting operation	Correction
	J-7264	During operation: The conveyance sensor (PS601) does not turn ON within a specified period of time after the leading/trailing/side edge sensors of the paper edge sensor board (PESB) turn ON.		Remove jammed paper if any from the ZU/main body.
SD-510	J-7265	During operation: While in the tri-folding mode, the 2nd folding sensor (PS112) does not turn ON within a specified period of time after 1st folding starts.	The SD and the main body stop immediately.	Remove jammed paper if any from the SD/main body.
	J-7266	During operation: The SD entrance sensor (PS102) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the SD/main body.
	J-7272	During operation: Stapler bucking, empty staple.		Remove jammed paper if any from the SD/main body.
FS	J-7281	During operation: The stapler home sensor (PS40) does not turn ON within a specified period of time after the stapler motor (M31) turns ON.	The FS and the main body stop immediately.	Remove jammed paper if any from the FS/main body after the FS front door is opened or closed.
	J-7290	During operation: FS or SD does not stop within a specified period of time after the operation stop signal is transmitted from the main body to the FS or SD.		Remove jammed paper if any from the FS, the SD and the main body.
	J-7301	When idling: The main tray paper exit sensor (PS10) turns ON while in idling.	-	Open the FS front door and the jam release lever, and remove jammed paper, if any.
	J-7302	When idling: The paper overlap sensor /1 (PS32) turns ON while in idling.		Open the FS front door and the jam release lever, and remove jammed paper, if any.
	J-7303	When idling: The stacker upper sensor (PS43) turns ON while in idling.		Open the FS front door and the jam release lever, and remove jammed paper, if any.
	J-7304	When idling: The paper overlap sensor /2 (PS33) turns ON while in idling.		Open the FS front door and the jam release lever, and remove jammed paper, if any.
	J-7305	When idling: The FNS entrance sensor (PS1) turns ON while in idling.		Open the FS front door and the jam release lever, and remove jammed paper, if any.
	J-7307	When idling: The sub tray exit sensor (PS8) turns ON while in idling.		Open the FS front door and the jam release lever, and remove jammed paper, if any.
	J-7308	When idling: The stacker empty sensor (PS28) turns ON while in idling.		Open the FS front door and the jam release lever, and remove jammed paper, if any.
SD-510	J-7309	When idling: The stacker empty sensor (PS101) turns ON while in idling.		Open the FS front door and the jam release lever, and remove jammed paper, if any.
	J-7310	When idling: The folding exit sensor (PS113) turns ON while in idling.		Open the FS front door and the jam release lever, and remove jammed paper, if any.
PI	J-7314	When idling: The paper passage sensor /Lw (PS206) turns ON while in idling.		Open the FS front door and the jam release lever, and remove jammed paper if any.
FS	J-7316	When idling: The paper overlap sensor /3 (PS5) turns ON while in idling.		Open the FS front door and the jam release lever, and remove jammed paper, if any.
PI	J-7317	When idling: The paper passage sensor /Up (PS201) turns ON while in idling.		Open the FS front door and the jam release lever, and remove jammed paper if any.
SD-510	J-7318	When idling: The SD entrance sensor (PS102) turns ON while in idling.		Open the FS front door and the jam release lever, and remove jammed paper, if any.
	J-7319	When idling: The 2nd folding sensor (PS112) turns ON while in idling.		Open the FS front door and the jam release lever, and remove jammed paper, if any.
GP-502	J-7320	When idling: The bypass direct entry sensor turns ON while in idling.	-	Remove jammed paper if any from the GP/main body.
	J-7321	When idling: The bypass direct exit sensor turns ON while in idling.		Remove jammed paper if any from the GP/main body.

Classification	JAM Code	Cause	Resulting operation	Correction
	J-7322	When idling: The tall vertical entry sensor turns ON while in idling.		Remove jammed paper if any from the GP/main body.
	J-7323	When idling: The punch sensor turns ON while in idling.		Remove jammed paper if any from the GP/main body.
	J-7324	When idling: The pullback sensor turns ON while in idling.		Remove jammed paper if any from the GP/main body.
	J-7325	When idling: The paper present sensor (below tray) turns ON while in idling.		Remove jammed paper if any from the GP/main body.
	J-7326	When idling: The jam sensor at the document drawer turns ON while in idling.		Remove jammed paper if any from the GP/main body.
ZU	J-7330	When idling: One of these sensors turn ON while in idling. Conveyance sensor (PS601) 1st folding stopper home sensor (PS603) 2nd folding stopper home sensor (PS604) Punch shift home sensor (PS605) - Exit sensor (PS609)	-	Open the ZU front door and the jam release lever, and remove jammed paper, if any.
RU	J-7340	When idling: (RU-510) Either of the entrance sensor (PS1), the entrance jam sensor (PS6), or the gate home sensor (PS7) turns ON while in idling.		Open the front door, and remove jammed paper, if any
	J-7341	When idling: (RU-510) Either of the stacker jam sensor (PS5) or the stack switch home sensor (PS8) turns ON while in idling.		Open the front door, and remove jammed paper, if any
	J-7342	When idling: (RU-510) The paper exit sensor (PS2) turns ON while in idling.		Open the front door, and remove jammed paper, if any
LS (3rd tandem)	J-7346	During operation: The entrance sensor (PS4) turns ON while in idling.		Open the LS front door, open then entrance conveyance jam release lever and remove jammed paper, if any.
	J-7347	When idling: The sub tray paper exit sensor (PS10) turns ON while in idling.		Open the LS sub tray cover, and remove jammed paper, if any.
	J-7348	When idling: Either of the conveyance sensor /1 (PS7), /2 (PS16), or /3 (PS17) turns ON while in idling.		Open the LS jam door, and remove jammed paper, if any
	J-7349	When idling: The coupling exit sensor (PS18) turns ON while in idling.		Open the LS front door, open then the coupling exit jam release lever and remove jammed paper, if any.
LS (1st tandem)	J-7350	During operation: The entrance sensor (PS4) turns ON while in idling.		Open the LS front door, open then entrance conveyance jam release lever and remove jammed paper, if any.
	J-7351	When idling: The sub tray paper exit sensor (PS10) turns ON while in idling.		Open the LS sub tray cover, and remove jammed paper, if any.
	J-7352	When idling: Either of the conveyance sensor /1 (PS7), /2 (PS16), or /3 (PS17) turns ON while in idling.		Open the LS jam door, and remove jammed paper, if any
	J-7353	When idling: The coupling exit sensor (PS18) turns ON while in idling.		Open the LS front door, open then the coupling exit jam release lever and remove jammed paper, if any.
LS (2nd tandem)	J-7354	During operation: The entrance sensor (PS4) turns ON while in idling.		Open the LS front door, open then entrance conveyance jam release lever and remove jammed paper, if any.
	J-7355	When idling: The sub tray paper exit sensor (PS10) turns ON while in idling.		Open the LS sub tray cover, and remove jammed paper, if any.
	J-7356	When idling: Either of the conveyance sensor /1 (PS7), /2 (PS16), or /3 (PS17) turns ON while in idling.		Open the LS jam door, and remove jammed paper, if any
	J-7357	When idling: The coupling exit sensor (PS18) turns ON while in idling.		Open the LS front door, open then the coupling exit jam release lever and remove jammed paper, if any.

Classification	JAM Code	Cause	Resulting operation	Correction
FD	J-7358	When idling: Either of the FD entrance sensor (PS1), the punch conveyance sensor (PS5), or the punch registration sensor (PS6) turns ON while in idling.		Open the FD front door, open then the entrance conveyance jam release levers /1 and /2 and the punch conveyance jam release levers /1 and /2, and then remove jammed paper, if any.
	J-7359	When idling: Either of the intermediate conveyance sensor (PS13), the sub tray paper exit sensor (PS16), or the main tray paper exit sensor (PS18) turns ON while in idling.		Open the FD front door and the intermediate conveyance jam lever, and remove the jammed paper, if any.
	J-7360	When idling: Either of the 1st folding conveyance sensor (PS51), the 2nd folding conveyance sensor (PS53), the 3rd folding conveyance sensor (PS54), the S size conveyance sensor (PS58), the folding entrance sensor (PS52), or the folding exit sensor (PS2) turns ON while in idling.		Open the FD front door, pull out the folding conveyance section, open the folding conveyance jam release levers /1 to /5, and remove jammed paper, if any.
	J-7361	When idling: Either of the PI conveyance sensor /Up (PS31), the PI conveyance sensor /Lw (PS37), or the PI exit sensor (PS4) turns ON while in idling.		Open the FD upper door and remove jammed paper, if any. When jammed paper gets in the PI exit, open the entrance conveyance jam release lever /1 and remove the jammed paper.
RU	J-7365	When idling: (RU-509) The entrance sensor (PS1) turns ON while in idling.		Open the front door, and remove jammed paper, if any
	J-7366	When idling: (RU-509) Either of the de-curler entrance sensor (PS2) or the humidification section entrance sensor (PS7) turns ON while in idling.		Open the front door, and remove jammed paper, if any
	J-7367	When idling: (RU-509) Either of the color density detection timing sensor (PS3), paper exit conveyance sensor (PS4) or paper exit sensor (PS12) turns ON while in idling.		Open the front door, and remove jammed paper, if any
SD-506	J-7368	When idling: The entrance sensor (PS1) turns ON while in idling.		Open the SD front door /Rt and remove jammed paper, if any.
	J-7369	When idling: Either of the horizontal conveyance sensor /1 (PS2), the horizontal conveyance sensor /2 (PS3), or the sub tray exit sensor (PS11) turns ON while in idling.		Open the SD front door /Rt and remove jammed paper, if any.
	J-7370	When idling: The horizontal conveyance exit sensor (PS4) turns ON while in idling.		Open the SD front door /Lt and remove jammed paper, if any.
	J-7371	When idling: Either of the right angle conveyance sensor /1 (PS5) or the right angle conveyance sensor /2 (PS6) turns ON while in idling.		Open the SD front door /Rt and remove jammed paper, if any.
	J-7372	When idling: Either of the folding sensor /1 (PS7), the folding passage sensor (PS8), the tri-folding exit sensor (PS9), or the folding sensor /2 (PS44) turns ON while in idling.		Open the SD front door /Lt and remove jammed paper, if any.
	J-7373	When idling: The saddle stitching paper sensor (PS13) turns ON while in idling.		Open the SD front door /Lt and remove jammed paper, if any.
	J-7374	When idling: Either of the bundle sensor /1 (PS14), /2 (PS15), /4 (PS54), or the bundle exit sensor /2 (PS57) turns ON while in idling.		Open the SD front door /Lt and remove jammed paper, if any.
PB	J-7380	When idling: Either of the entrance sensor (PS1), the SC entrance sensor (PS2), the cover paper entrance sensor (PS3), or the sub tray paper exit sensor (PS4) turns ON while in idling.		Open the PB front door or the upper door, and remove jammed paper, if any.
	J-7381	When idling: The SC paper detection sensor (PS16) turns ON while in idling.		Open the PB upper door, and remove jammed paper, if any.
	J-7382	When idling: The clamp paper sensor (PS28) turns ON while in idling.		Open the PB front door, pull out the clamp section, and remove jammed paper, if any.

Classification	JAM Code	Cause	Resulting operation	Correction
	J-7383	When idling: Either of the cover paper switchback sensor (PS44), the cover paper sensor /Rt (PS45), or the cover paper sensor /Lt (PS46) turns ON while in idling.		Open the PB front door, and remove jammed paper, if any.
	J-7384	When idling: The book end fence sensor (PS61) turns ON while in idling.		Open the PB stacker door, and remove jammed paper, if any.
	J-7385	When idling: The cover paper conveyance sensors /1 (PS75), /2 (PS76), /3 (PS77), /4 (PS78), and /5 (PS79) turn ON while in idling.		Pull out the paper feed tray, and remove jammed paper, if any.
	J-7386	When idling: The relay conveyance entrance sensor (PS93), the relay conveyance intermediate sensor (PS91) and the relay conveyance exit sensor (PS94) turn ON during idling.		Open the PB relay conveyance door and remove jammed paper if any.
GP-501	J-7390	When idling: The enter sensor (S1) turns ON while in idling.		Open the GP front door, the bypass panel cover, and remove the jammed paper, if any.
	J-7391	When idling: The stepper 1 speed sensor (S2) turns ON while in idling.		Open the GP front door, the entrance aligner panel, and remove the jammed paper, if any.
	J-7392	When idling: The bypass sensor (S8) turns ON while in idling.		Open the GP front door, the bypass panel cover, and remove the jammed paper, if any.
	J-7393	When idling: The exit sensor (S7) turns ON while in idling.		Open the GP front door, the bypass panel cover, and remove the jammed paper, if any.
	J-7394	When idling: The punch flag sensor (S9) turns ON while in idling.		Open the GP front door, the entrance aligner panel, the bottom U-channel, and remove the jammed paper, if any.
	J-7395	When idling: The u-channel sensor (S4) turns ON while in idling.		Open the GP front door, the bottom U-channel, and remove the jammed paper, if any.
	J-7396	When idling: The backstop sensor (S5) turns ON while in idling.		Open the GP front door, the bottom U-channel, and remove the jammed paper, if any.
	J-7397	When idling: The stepper 2 speed sensor (S6) turns ON while in idling.		Open the GP front door, the exit aligner panel, and remove the jammed paper, if any.
LS (1st tandem)	J-7401	During operation: The entrance sensor (PS4) does not turn ON within a specified period of time after the main body paper exit sensor (PS3) turns ON.	The LS and the main body stop immediately.	Remove jammed paper if any from the LS/main body.
	J-7402	During operation: The entrance sensor (PS4) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the LS/main body.
	J-7403	During operation: The sub tray exit sensor (PS10) does not turn ON within a specified period of time after the entrance sensor (PS4) turns ON.		Remove jammed paper if any from the LS/main body.
	J-7404	During operation: The sub tray paper exit sensor (PS10) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the LS/main body.
	J-7405	During operation: The conveyance sensor /1 (PS7) does not turn ON within a specified period of time after the entrance sensor (PS4) turns ON.		Remove jammed paper if any from the LS/main body.
	J-7406	During operation: The conveyance sensor /1 (PS7) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the LS/main body.
	J-7407	During operation: The conveyance sensor /2 (PS16) does not turn ON within a specified period of time after the conveyance sensor /1 (PS7) turns ON.		Remove jammed paper if any from the LS/main body.
	J-7408	During operation: The conveyance sensor /2 (PS16) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the LS/main body.

Classification	JAM Code	Cause	Resulting operation	Correction
	J-7409	During operation: The conveyance sensor /3 (PS17) does not turn ON within a specified period of time after the conveyance sensor /2 (PS16) turns ON.		Remove jammed paper if any from the LS/main body.
	J-7410	During operation: The conveyance sensor /3 (PS17) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the LS/main body.
	J-7411	During operation: The coupling exit sensor (PS18) does not turn ON within a specified period of time after the conveyance sensor /3 (PS17) turns ON.		Remove jammed paper if any from the LS/main body.
	J-7412	During operation: The coupling exit sensor (PS18) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the LS/main body.
LS (2nd tandem)	J-7431	During operation: The entrance sensor (PS4) does not turn ON within a specified period of time after the main body paper exit sensor (PS3) turns ON.		Remove jammed paper if any from the LS/main body.
	J-7432	During operation: The entrance sensor (PS4) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the LS/main body.
	J-7433	During operation: The sub tray exit sensor (PS10) does not turn ON within a specified period of time after the entrance sensor (PS4) turns ON.		Remove jammed paper if any from the LS/main body.
	J-7434	During operation: The sub tray paper exit sensor (PS10) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the LS/main body.
	J-7435	During operation: The conveyance sensor /1 (PS7) does not turn ON within a specified period of time after the entrance sensor (PS4) turns ON.		Remove jammed paper if any from the LS/main body.
	J-7436	During operation: The conveyance sensor /1 (PS7) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the LS/main body.
	J-7437	During operation: The conveyance sensor /2 (PS16) does not turn ON within a specified period of time after the conveyance sensor /1 (PS7) turns ON.		Remove jammed paper if any from the LS/main body.
	J-7438	During operation: The conveyance sensor /2 (PS16) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the LS/main body.
	J-7439	During operation: The conveyance sensor /3 (PS17) does not turn ON within a specified period of time after the conveyance sensor /2 (PS16) turns ON.		Remove jammed paper if any from the LS/main body.
	J-7440	During operation: The conveyance sensor /3 (PS17) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the LS/main body.
	J-7441	During operation: The coupling exit sensor (PS18) does not turn ON within a specified period of time after the conveyance sensor /3 (PS17) turns ON.		Remove jammed paper if any from the LS/main body.
	J-7442	During operation: The coupling exit sensor (PS18) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the LS/main body.
LS (3rd tandem)	J-7461	During operation: The entrance sensor (PS4) does not turn ON within a specified period of time after the main body paper exit sensor (PS3) turns ON.		Remove jammed paper if any from the LS/main body.
	J-7462	During operation: The entrance sensor (PS4) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the LS/main body.
	J-7463	During operation: The sub tray exit sensor (PS10) does not turn ON within a specified period of time after the entrance sensor (PS4) turns ON.		Remove jammed paper if any from the LS/main body.

Classification	JAM Code	Cause	Resulting operation	Correction
	J-7464	During operation: The sub tray paper exit sensor (PS10) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the LS/main body.
	J-7465	During operation: The conveyance sensor /1 (PS7) does not turn ON within a specified period of time after the entrance sensor (PS4) turns ON.		Remove jammed paper if any from the LS/main body.
	J-7466	During operation: The conveyance sensor /1 (PS7) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the LS/main body.
	J-7467	During operation: The conveyance sensor /2 (PS16) does not turn ON within a specified period of time after the conveyance sensor /1 (PS7) turns ON.		Remove jammed paper if any from the LS/main body.
	J-7468	During operation: The conveyance sensor /2 (PS16) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the LS/main body.
	J-7469	During operation: The conveyance sensor /3 (PS17) does not turn ON within a specified period of time after the conveyance sensor /2 (PS16) turns ON.		Remove jammed paper if any from the LS/main body.

	J-7471	During operation: The coupling exit sensor (PS18) does not turn ON within a specified period of time after the conveyance sensor /3 (PS17) turns ON.		Remove jammed paper if any from the LS/main body.
	J-7472	During operation: The coupling exit sensor (PS18) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the LS/main body.
FD	J-7501	During operation: The FD entrance sensor (PS1) does not turn ON within a specified period of time after the main body paper exit sensor (PS3) turns ON.	The FD and the main body stop immediately.	Remove jammed paper if any from the FD/main body.
	J-7502	During operation: The intermediate conveyance sensor (PS13) does not turn ON within a specified period of time after the FD entrance sensor (PS1) turns ON.		Remove jammed paper if any from the FD/main body.
	J-7503	During operation: The main tray exit sensor (PS18) does not turn ON within a specified period of time after the intermediate conveyance sensor (PS13) turns ON.		Remove jammed paper if any from the FD/main body.
	J-7504	During operation: The main tray exit sensor (PS18) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the FD/main body.
	J-7505	During operation: The sub tray paper exit sensor (PS16) does not turn ON within a specified period of time after the intermediate conveyance sensor (PS13) turns ON.		Remove jammed paper if any from the FD/main body.
	J-7506	During operation: The sub tray paper exit sensor (PS16) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the FD/main body.
	J-7507	During operation: The punch conveyance sensor (PS5) does not turn ON within a specified period of time after the FD entrance sensor (PS1) turns ON.		Remove jammed paper if any from the FD/main body.
	J-7508	During operation: The 3rd folding conveyance sensor (PS54) does not turn ON within a specified period of time after the punch conveyance sensor (PS5) turns ON.		Remove jammed paper if any from the FD/main body.
	J-7509	During operation: The punch registration sensor (PS6) does not turn ON within a specified period of time after the punch conveyance sensor (PS5) turns ON.		Remove jammed paper if any from the FD/main body.
	J-7510	During operation: The 1st folding conveyance sensor (PS51) does not turn ON within a specified period of time after the punch registration sensor (PS6) turns ON.		Remove jammed paper if any from the FD/main body.

Classification	JAM Code	Cause	Resulting operation	Correction
	J-7511	During operation: The 3rd folding conveyance sensor (PS54) does not turn ON within a specified period of time after the 1st folding conveyance sensor (PS51) turns ON.		Remove jammed paper if any from the FD/main body.
	J-7512	During operation: The intermediate conveyance sensor (PS13) does not turn ON within a specified period of time after the 3rd folding conveyance sensor (PS54) turns ON.		Remove jammed paper if any from the FD/main body.
	J-7513	During operation: While in the folding operation, the 2nd folding conveyance sensor (PS53) does not turn ON within a specified period of time after the 1st folding motor (M4) starts to accelerate.		Remove jammed paper if any from the FD/main body.
	J-7514	During operation: While in the folding operation, the 3rd folding conveyance sensor (PS54) does not turn ON within a specified period of time after the 1st folding motor (M4) starts to accelerate.		Remove jammed paper if any from the FD/main body.
	J-7515	During operation: While in the folding operation, the 3rd folding conveyance sensor (PS54) does not turn ON within a specified period of time after the 2nd folding motor (M5) starts to accelerate.		Remove jammed paper if any from the FD/main body.
	J-7516	During operation: While in the folding operation, the intermediate conveyance sensor (PS13) does not turn ON within a specified period of time after the 3rd folding motor (M6) starts to accelerate.		Remove jammed paper if any from the FD/main body.
	J-7517	During operation: While in the folding operation, the 3rd folding conveyance sensor (PS54) does not turn ON within a specified period of time after the 2nd folding conveyance sensor (PS53) turns ON.		Remove jammed paper if any from the FD/main body.
	J-7518	During operation: While in the folding operation, the intermediate conveyance sensor (PS13) does not turn ON within a specified period of time after the 3rd folding conveyance sensor (PS54) turns ON.		Remove jammed paper if any from the FD/main body.
	J-7519	During operation: The PI conveyance sensor / Up (PS31) does not turn ON within a specified period of time after the PI pick-up solenoid /Up (SD13) turns ON.		Remove jammed paper if any from the FD/main body.
	J-7520	During operation: The PI exit sensor (PS4) does not turn ON within a specified period of time after the PI conveyance sensor /Up (PS31) turns ON.		Remove jammed paper if any from the FD/main body.
	J-7521	During operation: The PI conveyance sensor / Lw (PS37) does not turn ON within a specified period of time after the PI pick-up solenoid /Lw (SD14) turns ON.		Remove jammed paper if any from the FD/main body.
	J-7522	During operation: The PI exit sensor (PS4) does not turn ON within a specified period of time after the PI conveyance sensor /Lw (PS37) turns ON.		Remove jammed paper if any from the FD/main body.
	J-7523	During operation: The FD entrance sensor (PS1) does not turn ON within a specified period of time after the PI exit sensor (PS4) turns ON.		Remove jammed paper if any from the FD/main body.
	J-7524	During operation: The PI multi feed is detected.		Remove jammed paper if any from the FD/main body.
RU	J-7530	During operation: (RU-510) The entrance sensor (PS1) does not turn ON within a specified period of time after the main body paper exit sensor (PS3) turns ON.	The RU and the main body stop immediately.	Remove jammed paper if any from the RU/main body.
	J-7531	During operation: (RU-510) While in the straight pass, the paper exit sensor (PS2) does not turn ON within a specified period of time after the entrance sensor (PS1) turns ON.		Remove jammed paper if any from the RU/main body.

Classification	JAM Code	Cause	Resulting operation	Correction
	J-7532	During operation: (RU-510) The entrance sensor (PS1) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the RU/main body.
	J-7533	During operation: (RU-510) While in the reverse pass, the paper exit sensor (PS2) does not turn ON within a specified period of time after the entrance sensor (PS1) turns ON.		Remove jammed paper if any from the RU/main body.
	J-7535	During operation: (RU-510) The paper exit sensor (PS2) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the RU/main body.
	J-7550	During operation: (RU-509) The entrance sensor (PS1) does not turn ON within a specified period of time.		Remove jammed paper if any from the RU/main body.
	J-7551	During operation: (RU-509) The de-curler entrance sensor (PS7) does not turn ON within a specified period of time.		Remove jammed paper if any from the RU/main body.
	J-7552	During operation: (RU-509) The de-curler entrance sensor (PS2) does not turn ON within a specified period of time in the bypass path conveyance.		Remove jammed paper if any from the RU/main body.
	J-7553	During operation: (RU-509) The de-curler entrance sensor (PS2) does not turn ON within a specified period of time in the lower path conveyance.		Remove jammed paper if any from the RU/main body.
	J-7554	During operation: (RU-509) The color density detection timing sensor (PS3) does not turn ON within a specified period of time.		Remove jammed paper if any from the RU/main body.
	J-7555	During operation: (RU-509) The paper exit sensor (PS12) does not turn ON within a specified period of time.		Remove jammed paper if any from the RU/main body.
	J-7556	During operation: (RU-509) The paper exit sensor (PS12) does not turn OFF within a specified period of time.		Remove jammed paper if any from the RU/main body.
SD-506	J-7561	During operation: The entrance sensor (PS1) does not turn ON within a specified period of time after the main body paper exit sensor (PS3) turns ON.	The SD and the main body stop immediately.	Remove jammed paper if any from the SD/main body.
	J-7562	During operation: The horizontal conveyance sensor /1 (PS2) does not turn ON within a specified period of time after the entrance sensor (PS1) turns ON.		Remove jammed paper if any from the SD/main body.
	J-7563	During operation: The horizontal conveyance sensor /2 (PS3) does not turn ON within a specified period of time after the horizontal conveyance sensor /1 (PS2) turns ON.		Remove jammed paper if any from the SD/main body.
	J-7564	During operation: The horizontal conveyance exit sensor (PS4) does not turn ON within a specified period of time after the horizontal conveyance sensor /2 (PS3) turns ON.		Remove jammed paper if any from the SD/main body.
	J-7565	During operation: The horizontal conveyance exit sensor (PS4) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the SD/main body.
	J-7566	During operation: The sub tray paper exit sensor (PS11) does not turn ON within a specified period of time after the horizontal conveyance sensor /1 (PS2) turns ON.		Remove jammed paper if any from the SD/main body.

Classification	JAM Code	Cause	Resulting operation	Correction
	J-7567	During operation: The sub tray paper exit sensor (PS11) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the SD/main body.
	J-7568	During operation: The right angle conveyance sensor /2 (PS6) does not turn ON within a specified period of time after the right angle conveyance motor (M6) turns ON.		Remove jammed paper if any from the SD/main body.
	J-7569	During operation: The folding sensor /1 (PS7) does not turn ON within a specified period of time after the folding entrance motor (M3) turns ON.		Remove jammed paper if any from the SD/main body.
	J-7570	During operation: The saddle stitching paper sensor (PS13) does not turn ON within a specified period of time after the folding sub scan alignment exit motor (M8) turns ON.		Remove jammed paper if any from the SD/main body.
	J-7571	During operation: The bundle sensor /1 (PS14) does not turn ON within a specified period of time after the bundle arm rotation motor (M22) turns ON.		Remove jammed paper if any from the SD/main body.
	J-7572	During operation: The bundle sensor /2 (PS15) does not turn ON within a specified period of time after the bundle clip motor (M11) turns ON.		Remove jammed paper if any from the SD/main body.
	J-7573	During operation: The bundle sensor /4 (PS54) does not turn ON within a specified period of time after the bundle sensor /2 (PS15) turns ON.		Remove jammed paper if any from the SD/main body.
	J-7574	During operation: The entrance sensor (PS1) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the SD/main body.
	J-7575	During operation: The right angle conveyance sensor /2 (PS6) does not turn OFF within a specified period of time after it turns ON. Or the folding entrance sensor (PS60) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the SD/main body.
	J-7576	During operation: The folding sensor /2 (PS44) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the SD/main body.
	J-7577	During operation: The bundle sensor /1 (PS14) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the SD/main body.
	J-7578	During operation: The bundle sensor /2 (PS15) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the SD/main body.
	J-7579	During operation: The folding passage sensor (PS8) does not turn ON within a specified period of time after the folding transfer motor (M4) turns ON.		Remove jammed paper if any from the SD/main body.
	J-7580	During operation: The tri-folding exit sensor (PS9) does not turn ON within a specified period of time after the folding transfer motor (M4) turns ON.		Remove jammed paper if any from the SD/main body.
	J-7581	During operation: The folding sub scan alignment exit motor (M8) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the SD/main body.
	J-7582	During operation: The folding passage sensor (PS8) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the SD/main body.
	J-7583	During operation: The tri-folding paper exit sensor (PS9) does not turn OFF within a specified period of time after it turns ON.		Remove jammed paper if any from the SD/main body.
	J-7584	During operation: The trimming registration sensor (PS55) does not turn ON within a specified period of time after the bundle press movement motor (M17) turns ON.		Remove jammed paper if any from the SD/main body.
	J-7585	During operation: The trimming registration sensor (PS55) does not turn OFF within a specified period of time after the bundle registration motor (M12) turns ON.		Remove jammed paper if any from the SD/main body.

	J-9401	During operation: After the start from the 2nd stopping position, the ADU deceleration sensor (PS42) does not turn ON within a specified period of time.	If there is a sheet of paper being printed when a jam occurs, the main body completes the paper exit before stopping operations.	Open the main body front doors / R and /L, pull out the duplex section and remove jammed paper if any.
	J-9451	When idling: ADU exit sensor (PS43) turns ON while in idling.	-	Open the main body front doors / R and /L, pull out the duplex section and remove jammed paper if any.

1.394 J-7601_7612 (GP-502)

2. MALFUNCTION CODE

2.1 Trouble reset method

Turn OFF/ON the power switch (SW2) of the main body when releasing an abnormal condition.

2.2 Function to detach defective sections

When the abnormality occurs on the part for which the faulty part isolation function is available, the defective units can be detached temporarily to use other control unit manually.

While detached, an error detection is not carried out on these detached units.

There are 2 methods of setting for limited use.

(1) User operation

When a malfunction code occurs, press the HELP key following the message on the operation panel and then turn the sub power switch (SW2) OFF and ON. This operation allows you to use it temporarily until the SW2 is OFF and ON (including an OFF/ON operation by the weekly timer) next time.

(2) DIPSW setting

Turning the sub power switch (SW2) OFF and ON after setting the specified software DIPSW bit allows you to make a limited use of it until the bit setting is released next time (it requires the OFF/ON operation of the SW2).

2.3 Malfunction code list

⚠ WARNING

- When any malfunction of C1540 to 1562; PB glue tank temperature abnormality or C-2214 to 2217, 3501, 3906; fusing temperature abnormality occurs, be sure to repair defective parts then set the software DIPSW3-1 of service mode to 0. If DIPSW3-1 is set to 0 before defective parts are fixed, it may cause fire.

	CN1	-	C-4725	LPH drive board (LPHB) connection abnormality.

Relay board /U (RBU)	CN5	-	-	At the triple service port section on the arm section of the operation panel, all service ports does not operates.
	CN7	-	-	At the triple service port section on the arm section of the operation panel, the upper port operates while the middle and lower ports does not operates.

2.5 Solution 1 (C-0001_0300)

2.5.1 C-0001

Code

C-0001

Classification

Main body: Drive abnormality

Cause

Main body drive serial input abnormality 1.

Within a specified period of time after the power ON, a serial data is not received between the printer control board (PRCB) and the main body drive board.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay) .

Estimated abnormal parts

- Printer control board (PRCB)

Correction

Turn OFF/ON the power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please turn on power again" is displayed on the touch panel.

Solution

1. After turning OFF the sub power switch, turn OFF the main power switch and unplug the power plug. Restart the main body after 10 seconds.
2. Check the connection status of PRCB connector, and repair it if any abnormality.
3. Replace PRCB.

Faulty part isolation DIPSW

Control while detached

2.5.2 C-0002

Code

C-0002

Classification

Main body: Drive abnormality

Cause

Main body drive serial input abnormality 2.

Within a specified period of time after the power ON, a serial data is not received between the printer control board (PRCB) and the main body drive board.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay) .

Estimated abnormal parts

- Printer control board (PRCB)

Correction

Turn OFF/ON the power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please turn on power again" is displayed on the touch panel.

Solution

1. After turning OFF the sub power switch, turn OFF the main power switch and unplug the power plug. Restart the main body after 10 seconds.
2. Check the connection status of PRCB connector, and repair it if any abnormality.
3. Replace PRCB.

Faulty part isolation DIPSW

Control while detached

2.5.3 C-0003

Code

C-0003

Classification

Main body: Drive abnormality

Cause

Main body drive serial input abnormality 3.

Within a specified period of time after the power ON, a serial data is not received between the printer control board (PRCB) and the main body drive board.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay) .

Estimated abnormal parts

- Printer control board (PRCB)

Correction

Turn OFF/ON the power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please turn on power again" is displayed on the touch panel.

Solution

1. After turning OFF the sub power switch, turn OFF the main power switch and unplug the power plug. Restart the main body after 10 seconds.
2. Check the connection status of PRCB connector, and repair it if any abnormality.
3. Replace PRCB.

Code

C-0004

Classification

Main body: Drive abnormality

Cause

Main body drive serial input abnormality4.

Within a specified period of time after the power ON, a serial data is not received between the printer control board (PRCB) and the main body drive board.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay) .

Estimated abnormal parts

- Printer control board (PRCB)

Correction

Turn OFF/ON the power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please turn on power again" is displayed on the touch panel.

Solution

1. After turning OFF the sub power switch, turn OFF the main power switch and unplug the power plug. Restart the main body after 10 seconds.
2. Check the connection status of PRCB connector, and repair it if any abnormality.
3. Replace PRCB.

Classification

Main body: Communication error

Cause

Drive communication reception error detection abnormality 3.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay) .

Estimated abnormal parts

- Printer control board (PRCB)
- ADU drive board (ADUDB)

Correction

Turn OFF/ON the power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please turn on power again" is displayed on the touch panel.

Solution

1. After turning OFF the sub power switch, turn OFF the main power switch and unplug the power plug. Restart the main body after 10 seconds.
2. Check the connector connection and the wiring between PRCB and ADUDB, and repair it if any abnormality
3. Check the connector connection on PRCB and ADUDB, and repair it if any abnormality
4. Replace ADUDB
5. Replace PRCB.

Control while detached

2.5.18 C-0101

Code

C-0101

Classification

Main body: Drive abnormality

Cause

Paper feed motor (M4) speed abnormality.

An error detection signal is detected twice in succession within a specified period of time after M4 was turned ON.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay) .

Estimated abnormal parts

- Paper feed motor (M4)
- Printer control board (PRCB)

Correction

Turn OFF/ON the power switch (SW2) of the main body when releasing an abnormal condition.

Note

- "Please call service" is displayed.

Solution

1. Check the connector connection and the wiring between PRCB and the motor, and repair it if any abnormality.
2. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram:Main body (3/4): 24-A, 4-D)
3. Replace M4.
4. Replace PRCB.

2.5.29 C-0113**Code**

C-0113

Classification

Main body: Power abnormality

Cause

Abnormality 1 of the SD/CL_24V power for the printer control board (PRCB) tray.

At the start, the error detection signals of the PRCB tray solenoid/clutch ICP blowout and 24V cut off are detected.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay) .

Estimated abnormal parts

- DC power supply /2 (DCPS/2)
- Printer control board (PRCB)

Correction

Turn OFF/ON the power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring related to DC24V between PRCB and DCPS /2, and repair it if any abnormality
2. Replace DCPS /2
3. Replace PRCB.

Faulty part isolation DIPSW**Control while detached****2.5.30 C-0114****Code**

C-0114

Classification

Main body: Power abnormality

Cause

Abnormality 2 of the SD/CL_24V power for the printer control board (PRCB) tray.

When the error detection signal of the PRCB tray solenoid/clutch ICP blowout is detected but no 24V cut off is detected at the start.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay).

Estimated abnormal parts

- Paper feed clutch /1 (CL4)
- Separation clutch /1 (CL5)
- Paper feed clutch /2 (CL6)
- Separation clutch /2 (CL7)
- Pick-up solenoid /1 (SD3)
- Pick-up solenoid /2 (SD4)
- Printer control board (PRCB)

Correction

Turn OFF/ON the power switch (SW2) of the main body when releasing an abnormal condition.

Note

- "Please call service" is displayed on the touch panel.

Solution

1. Check the connector connection and the wiring related to DC24V between PRCB and clutch/solenoid, and repair it if any abnormality
2. Check the drive and the coupling of the clutch and the solenoid, repair it if any abnormality, and then replace PRCB (Wiring diagram: Main body (3/4): 16-A, 22-A, Main body (3/4): 17-A)
3. Replace PRCB.
4. Replace the clutch, the solenoid and PRCB at a time

Classification

Main body: Power abnormality

Cause

Abnormality 2 of the SD/CL_24V power for the printer control board (PRCB) tray.

When the error detection signal of the PRCB tray solenoid/clutch ICP blowout is detected but no 24V cut off is detected at the start.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay).

Estimated abnormal parts

- Pre-registration clutch /1 (CL1)
- Vertical conveyance clutch (CL2)
- Pre-registration clutch /2 (CL3)
- Erase lamp (EL)
- Tray lock solenoid /1 (SD1)
- Tray lock solenoid /2 (SD2)
- Drum claw solenoid (SD10)
- Printer control board (PRCB)

Correction

Turn OFF/ON the power switch (SW2) of the main body when releasing an abnormal condition.

Note

- "Please call service" is displayed on the touch panel.

Solution

1. Check the connector connection and the wiring related to DC24V between PRCB and clutch/solenoid/EL, and repair it if any abnormality
2. Check the drive and the coupling of the clutch and the solenoid, repair it if any abnormality, and then replace PRCB (Wiring diagram: Main body (1/4): 23-B)
3. Replace PRCB.
4. Replace the clutch, the solenoid, EL and PRCB at a time

DIPSW18-1

Control while detached

Paper feed in tray /2 is unavailable (The operation panel is displayed in hatching)

2.5.56 C-0207**Code**

C-0207

Classification

Main body: Tray2

Cause

Tray /2 up abnormality 2.

When the upper limit sensor /2 (PS10) is OFF, PS10 does not turn ON within 20 seconds after the tray lift-up motor /2 (M34) turns ON for lifting operation. At this time, an error detection signal is not detected.

Measures to take when alert occurs

Error code is not displayed on the operation panel, but displayed only on the data collection, the list output and CSRC. Since the lifting operation of the tray is not completed, "Set paper in the tray x" is displayed on the operation panel.

Estimated abnormal parts

- Upper limit sensor /2 (PS10)
- Tray lift-up motor /2 (M34)
- Printer control board (PRCB)
- DC power supply /2 (DCPS/2)

Correction

Turn OFF/ON the power switch (SW2) of the main body when releasing an abnormal condition.

Note

- "Please call service" is displayed on the touch panel.

Solution

1. Check the paper loaded condition and the rear end restriction plate condition of the tray2, and repair it if any abnormality
2. Check the connector connection and the wiring between PRCB and motor/sensor, and repair it if any abnormality
3. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram: Main body (3/4): 21-A)
4. Check I/O and the operation of the sensor, and repair/replace it if any abnormality. (Wiring diagram: Main body (2/4): 18-A)
5. Replace PS10.
6. Replace M34
7. Replace PRCB.
8. Replace DCPS /2

Classification

PF: Tray3

Cause

1st tandem PF-703/706 upper tray up abnormality.

PF-703: When the upper limit sensor /1 (PS5) is OFF, PS5 does not turn ON within 20 seconds after the paper lift motor /1 (M7) turns ON for lifting operation. Or, the paper suction sensor /Fr1 and /Rr1 (PS25 and PS26) turn ON before PS5 turns ON while in tray lifting.

PF-706: When the upper limit sensor /1 (PS2) is OFF, PS2 does not turn ON within 20 seconds after the paper lift motor /1 (M42) turns ON for the lifting operation.

Measures to take when alert occurs

Error code is not displayed on the operation panel, but displayed only on the data collection, the list output and CSRC. Since the lifting operation of the tray is not completed, "Set paper in the tray x" is displayed on the operation panel.

Estimated abnormal parts

- Upper limit sensor /1 (PS5: PF-703)
- Upper limit sensor /1 (PS2: PF-706)
- Paper lift motor /1 (M7: PF-703)
- Paper lift motor /1 (M42: PF-706)
- PF drive board (PFUDB: PF-703/706)

Correction

Turn OFF/ON the power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the paper loaded condition and the rear end restriction plate misaligned of the upper tray, and repair it if any abnormality
2. Check the connector connection and the wiring between PFUDB and motor/sensor, and repair it if any abnormality
3. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality (Wiring diagram: PF-703: 6-F, PF-706: 5-C)
4. Check I/O and the operation of the sensor, and repair/replace it if any abnormality (Wiring diagram: PF-703: 3-F, PF-706: 3-C)
5. Replace PS5: PF-703 or PS2: PF-706
6. Replace M7: PF-703 or M42: PF-706
7. Replace PFUDB.

5. Upper limit sensor /1 (PS5: PF-703)
6. Replace PFUDB.

Faulty part isolation DIPSW**Control while detached****2.5.71 C-0251****Code**

C-0251

Classification

PI-PFU: PI Tray1

Cause

The locking of the upper tray paper lift motor /1 (M7) is detected.
When M7 is ON, an error detection signal of the M7 is detected.

Measures to take when alert occurs

Error code is not displayed on the operation panel, but displayed only on the data collection, the list output and CSRC. Since the lifting operation of the tray is not completed, "Set paper in the tray x" is displayed on the operation panel.

Estimated abnormal parts

- Paper lift motor /1 (M7: PF-703)
- PF drive board (PFUDB: PF-703)

Correction

Turn OFF/ON the power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring between PFUDB and the motor, and repair it if any abnormality
2. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality (Wiring diagram: PF-703: 6-F)
3. Replace M7: PF-703
4. Replace PFUDB.

Faulty part isolation DIPSW**Control while detached****2.5.72 C-0252****Code**

C-0252

Classification

PI-PFU: PI Tray2

Cause

PI-PFU (PF-703) middle tray up abnormality.

When the upper limit sensor /2 (PS9) is OFF, PS9 does not turn ON within 20 seconds after the paper lift motor /2 (M8) turns ON for lifting operation. Or, the paper suction sensor /Fr2 and /Rr2 (PS27 and PS28) turn ON before PS9 turns ON while in tray lifting.

Measures to take when alert occurs

Error code is not displayed on the operation panel, but displayed only on the data collection, the list output and CSRC. Since the lifting operation of the tray is not completed, "Set paper in the tray x" is displayed on the operation panel.

Estimated abnormal parts

- Upper limit sensor /2 (PS9: PF-703)
- Paper lift motor /2 (M8: PF-703)
- PF drive board (PFUDB: PF-703)

Correction

Turn OFF/ON the power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the paper loaded condition and the rear end restriction plate misaligned of the middle tray, and repair it if any abnormality
2. Check the connector connection and the wiring between PFUDB and motor/sensor, and repair it if any abnormality
3. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality (Wiring diagram: PF-703: 12-F)
4. Check I/O and the operation of the sensor, and repair/replace it if any abnormality. (Wiring diagram: PF-703: 9-F)
5. Replace PS9: PF-703
6. Replace M8: PF-703
7. Replace PFUDB.

C-0286

Classification

PI-PFU: PI Tray3

Cause

PI-PFU (PF-703) shutter motor /3 (M12) operation time abnormality 2.

The M12EM error detection signal is detected twice in succession within a specified period of time after M12 was turned ON. At this time, an error detection signal (blowout of ICP) is detected.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay) .

Estimated abnormal parts

- Shutter motor /3 (M12: PF-703)
- PF drive board (PFUDB: PF-703)

Correction

Turn OFF/ON the power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring between PFUDB and the motor, and repair it if any abnormality
2. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality (Wiring diagram: PF-703: 19-L)
3. Replace M12 and PFUDB at a time.

Classification

PF : fan abnormality

Cause

1st tandem PF-703/706 paper feed assist fan /Rr3 (FM10: PF-703, FM6: PF-706) power abnormality.

The FM10 EM and FM6 EM error detection signals are detected twice in succession within a specified period of time after FM10 and FM6 were turned ON. At this time, an error detection signal (blowout of ICP) is detected.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay).

Estimated abnormal parts

- Paper feed assist fan /Rr3 (FM10: PF-703)
- Paper feed assist fan /Rr3 (FM6: PF-706)
- PF drive board (PFUDB)

Correction

Turn OFF/ON the power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring between PFUDB and the fan, and repair it if any abnormality.
2. Rotate the fan by I/O or hand, and repair it if any abnormality. (Wiring diagram: PF-703: 19-F, PF-706: 9-C)
3. Replace FM10 and PFUDB at a time: PF-703

Cause

PI-PFU (PF-703) paper feed assist fan /Fr1 (FM1) rotation abnormality.

The FM1EM error detection signal is detected twice in succession within a specified period of time after FM1 was turned ON. However, an error detection signal (blowout of ICP) is not detected.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay) .

Estimated abnormal parts

- Paper feed assist fan /Fr1 (FM1: PF-703/706)
- PF drive board (PFUDB)

Correction

Turn OFF/ON the power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring between PFUDB and FM1, and repair it if any abnormality.
2. Rotate the fan by I/O or hand, and repair it if any abnormality. (Wiring diagram: PF-703: 6-F, PF-706: 4-C)
3. Replace FM1.
4. Replace PFUDB.

Classification

PI-PFU: Power abnormality

Cause

Abnormality of the 24V power for the PF drive board (PFUDB) of PI-PFU (PF-703).
While in printing, an error detection signal (24V power DOWN) of the PFUDB is detected.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay) .

Estimated abnormal parts

- Abnormality of the 24V power for the PF drive board (PFUDB) of PI-PFU (PF-703).
While in printing, an error detection signal (24V power DOWN) of the PFUDB is detected.

Correction

Turn OFF/ON the power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring on PFUDB, and repair it if any abnormality.
2. Replace PFUDB.

Cause

2nd tandem PF-703 paper leading edge separation fan /Fr1 (FM3) power abnormality.

The FM3EM error detection signal is detected twice in succession within a specified period of time after FM3 was turned ON. At this time, an error detection signal (blowout of ICP) is detected.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay) .

Estimated abnormal parts

- Paper leading edge separation fan /Fr1 (FM3: PF-703)
- PF drive board (PFUDB: PF-703)

Correction

Turn OFF/ON the power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring between PFUDB and the fan, and repair it if any abnormality.
2. Rotate the fan or I/O by hand, and repair it if any abnormality. (Wiring diagram: PF-703: 6-F)
3. Replace FM3 and PFUDB.

- PF drive board (PFUDB: PF-703)

Correction

Turn OFF/ON the power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring between PFUDB and the fan, and repair it if any abnormality.
2. Rotate the fan or I/O by hand, and repair it if any abnormality. (Wiring diagram: PF-703: 6-F)
3. Replace FM3.
4. Replace PFUDB.

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring between PFUDB and the fan heater, and repair it if any abnormality.
2. Rotate the fan by I/O or hand, and repair it if any abnormality. (Wiring diagram: PF-703: 10-C)
3. Replace the fan heater (FM24).
4. Replace PFUDB.

Classification

PF: PF power source abnormality

Cause

1st tandem PF-703 dehumidifier fan /Lt2 (FM25) rotation abnormality.

The FM25EM error detection signal is detected twice in succession within a specified period of time after FM25 was turned ON. However, an error detection signal (blowout of ICP) is not detected.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay) .

Estimated abnormal parts

- Dehumidifier fan /Lt2 (FM25: HT-505)
- PF drive board (PFUDB: PF-703)

Correction

Turn OFF/ON the power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring between PFUDB and the fan heater, and repair it if any abnormality.
2. Rotate the fan by I/O or hand, and repair it if any abnormality. (Wiring diagram: PF-703: 11-C)
3. Replace the fan heater (FM25).
4. Replace PFUDB.

The main body and option stop immediately to turn OFF the RL1 (the main relay) .

Estimated abnormal parts

- Lower tray fan heater (HT-505)
- AC drive board /2 (ACDB/2: HT-505)
- PF drive board (PFUDB: PF-703)

Correction

Turn OFF/ON the power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connection between ACDB/2 and the noise filter of PF-703.
2. Check the connector connection and the wiring between ACDB /2 and the fan heater, and repair it if any abnormality.
3. Check the connector connection and the wiring between PFUDB and the fan heater, and repair it if any abnormality.
4. Check the connector connection and the wiring between PFUDB and ACDB /2, and repair it if any abnormality.
5. Check the temperature and the installation of the fan heater, and repair it if any abnormality.
6. Replace the fan heater.
7. Replace ACDB/2.
8. Replace PFUDB.

Classification

PF: Heater temperature rise abnormality

Cause

1st tandem PF-703 dehumidification heater /1 (HTR1) temperature rise abnormality.

The temperature sensor /5 (TEMS/5) detects the heater temperature lower than 40°C a specified period of time after the heater is turned ON.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay) .

Estimated abnormal parts

- Upper tray fan heater (HT-505)
- AC drive board /2 (ACDB/2: HT-505)
- PF drive board (PFUDB: PF-703)

Correction

Turn OFF/ON the power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connection between ACDB/2 and the noise filter of PF-703.
2. Check the connector connection and the wiring between ACDB /2 and the fan heater, and repair it if any abnormality.
3. Check the connector connection and the wiring between PFUDB and the fan heater, and repair it if any abnormality.
4. Check the connector connection and the wiring between PFUDB and ACDB /2, and repair it if any abnormality.
5. Check the temperature and the installation of the fan heater, and repair it if any abnormality.
6. Replace the fan heater.
7. Replace ACDB/2.
8. Replace PFUDB.

Classification

PF: Heater low temperature abnormality

Cause

PI-PFU (PF-703) dehumidification heater /1 (HTR1) low temperature software abnormality.

The temperature sensor /5 (TEMS/5) detects the heater temperature lower than 0°C a specified period of time after the heater is turned ON.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay) .

Estimated abnormal parts

- Upper tray fan heater (HT-505)
- AC drive board /2 (ACDB/2: HT-505)
- PF drive board (PFUDB: PF-703)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connection between ACDB/2 and the noise filter of PF-703.
2. Check the connector connection and the wiring between ACDB /2 and the fan heater, and repair it if any abnormality.
3. Check the connector connection and the wiring between PFUDB and the fan heater, and repair it if any abnormality.
4. Check the connector connection and the wiring between PFUDB and ACDB /2, and repair it if any abnormality.
5. Check the temperature and the installation of the fan heater, and repair it if any abnormality.
6. Replace the fan heater.
7. Replace ACDB/2.
8. Replace PFUDB.

FS: FS-510 abnormality

Cause

The 1st folding knife home sensor (PS110) does not turn ON within a specified period of time after the 1st folding knife motor (M107) turns ON.

Measures to take when alert occurs

The main body and the SD stop immediately to turn OFF the main relay (RL1).

Estimated abnormal parts

- FNS control board (FNSCB)
- SD control board (SDCB)
- 1st folding knife motor (M107)
- 1st folding knife home sensor (PS110)

Correction

Turn OFF/ON the sub power switch of the main body.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the half-fold/fold&staple/tri-fold section, and repair it if any abnormality
2. Check the connector connection and the wiring between FNSCB and SDCB, and repair it if any abnormality.
3. Check the connector connection and the wiring between SDCB and motor/sensor, and repair it if any abnormality.
4. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram: SD-510: 8-B)
5. Check I/O and the operation of the sensor, and repair/replace it if any abnormality. (Wiring diagram: SD-510: 9-B)
6. Replace PS110.
7. Replace M107.
8. Replace SDCB.
9. Replace FNSCB.

C-1124

Classification

PI: PI abnormality

Cause

The tray upper limit sensor /Lw (PS209) or the tray lower limit sensor /Lw (PS210) does not turn ON within a specified period of time after the tray lift motor /Lw (M202) turns ON.

Measures to take when alert occurs

The main body and the FS stop immediately to turn OFF the main relay (RL1).

Estimated abnormal parts

- FNS control board (FNSCB)
- PI drive board (PIDB)
- Tray lift motor /Lw (M202)
- Tray upper limit sensor /Lw (PS209)

- Tray lower limit sensor /Lw (PS210)

Correction

Turn OFF/ON the sub power switch of the main body.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the PI lower tray section, and clean/repair it if any abnormality.
2. Check the connector connection and the wiring between PIDB and motor/sensor, and repair it if any abnormality.
3. Check the connector connection and the wiring between FNSCB and PIDB, and repair it if any abnormality.
4. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram:PI: 5-B)
5. Check I/O and the operation of the sensor, and repair/replace it if any abnormality. (Wiring diagram: PI: 6-B)
6. Replace M202.
7. Replace PS209.
8. Replace PS210.
9. Replace PIDB.
10. Replace FNSCB.

PI: PI abnormality

Cause

The tray upper limit sensor /Up (PS205) or the tray lower limit sensor /Up (PS204) does not turn ON within a specified period of time after the tray up down motor /Up (M201) turns ON.

Measures to take when alert occurs

The main body and the FS stop immediately to turn OFF the main relay (RL1).

Estimated abnormal parts

- FNS control board (FNSCB)
- PI drive board (PIDB)
- Tray up down motor /Up (M201)
- Tray upper limit sensor /Up (PS205)
- Tray lower limit sensor /Up (PS204)

Correction

Turn OFF/ON the sub power switch of the main body.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the PI lower tray section, and clean/repair it if any abnormality.
2. Check the connector connection and the wiring between PIDB and motor/sensor, and repair it if any abnormality.
3. Check the connector connection and the wiring between FNSCB and PIDB, and repair it if any abnormality.
4. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram: PI: 4-B)
5. Check I/O and the operation of the sensor, and repair/replace it if any abnormality. (Wiring diagram: PI: 4-B)
6. Replace M201.
7. Replace PS204.
8. Replace PS205.
9. Replace PIDB.

Classification

PK: PK abnormality

Cause

The punch shift home sensor (PS303) does not turn ON within a specified period of time after the punch shift motor (M302) turns ON.

Measures to take when alert occurs

The main body and the FS stop immediately to turn OFF the main relay (RL1).

Estimated abnormal parts

- FNS control board (FNSCB)
- Punch drive board (PDB)
- Punch shift motor (M302)
- Punch shift home sensor (PS303)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the punch kit, and clean/repair it if any abnormality.
2. Check the connector connection and the wiring between PDB and motor/sensor, and repair it if any abnormality.
3. Check the connector connection and the wiring between FNCSB and PDB and repair it if any abnormality.
4. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram: PK:7-B)
5. Check I/O and the operation of the sensor, and repair/replace it if any abnormality.
6. Replace M302.
7. Replace PS303.
8. Replace PDB.

ZU: ZU-608 abnormality

Cause

1st folding stopper home sensor (PS603) does not turned ON within a specified period of time after the 1st folding stopper motor (M602) starts the home position search operation.

Measures to take when alert occurs

The main body and the ZU stop immediately to turn OFF the main relay (RL1).

Estimated abnormal parts

- ZU control board (ZUCB)
- 1st folding stopper motor (M602)
- 1st folding stopper home sensor (PS603)

Correction

Turn OFF/ON the sub power switch of the main body.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring between ZUCB and motor/sensor, and repair it if any abnormality.
2. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram: ZU-608: 2-B)
3. Check I/O and the operation of the sensor, and repair/replace it if any abnormality. (Wiring diagram: ZU-608: 3-B)

2.8.41 C-1170**Code**

C-1170

Classification

FS: FS-532 abnormality

Cause

The exit paper press home sensor (PS37) does not turn ON within a specified period of time after the exit paper press motor (M26) turns ON.

Measures to take when alert occurs

The main body and the FS stop immediately to turn OFF the main relay (RL1).

Estimated abnormal parts

- FNS control board (FNSCB)
- Exit paper press motor (M26)
- Exit paper press home sensor (PS37)

Correction

Turn OFF/ON the sub power switch of the main body.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring between FNSCB and motor/sensor, and repair it if any abnormality.
2. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram: FS-532: 3-F)
3. Check I/O and the operation of the sensor, and repair/replace it if any abnormality. (Wiring diagram: FS-532: 7-B)
4. Replace PS37.
5. Replace M26.
6. Replace FNSCB.

Classification

FS: FS-532 abnormality

Cause

The small size paper alignment home sensor (PS26) does not turn ON within a specified period of time after the small size paper alignment motor (M18) turns ON.

Measures to take when alert occurs

The main body and the FS stop immediately to turn OFF the main relay (RL1).

Estimated abnormal parts

- FNS control board (FNSCB)
- Small size paper alignment motor (M18)
- Small size paper alignment home sensor (PS26)

Correction

Turn OFF/ON the sub power switch of the main body.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring between FNSCB and motor/sensor, and repair it if any abnormality.
2. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram: FS-532: 5-F)
3. Check I/O and the operation of the sensor, and repair/replace it if any abnormality. (Wiring diagram: FS-532: 11-B)
4. Replace PS26.
5. Replace M18.
6. Replace FNSCB.

LS (2nd tandem): LS abnormality

Cause

The stacker tray upper limit switch (MS2) is ON when the stacker tray up down motor (M1) is in the up operation.

Measures to take when alert occurs

The main body and the LS stop immediately to turn OFF the main relay (RL1).

Estimated abnormal parts

- Stacker tray up down motor (M1)
- Stacker tray upper limit switch (MS2)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the stacker tray up down section, and clean/repair it if any abnormality.
2. Check the connector connection and the wiring between LSCB and motor/switch, and repair it if any abnormality.
3. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram:LS-505:5-A)
4. Check the operation of the switch, and repair/replace it if any abnormality. (Wiring diagram: LS-505: 7-A)
5. Replace MS2.
6. Replace M1.
7. Replace LSCB.

Classification

LS (2nd tandem): LS abnormality

Cause

The stacker tray lower limit switch (MS3) is ON when the stacker tray up down motor (M1) is in the down operation.

Measures to take when alert occurs

The main body and the LS stop immediately to turn OFF the main relay (RL1).

Estimated abnormal parts

- Stacker tray up down motor (M1)
- Stacker tray lower limit switch (MS3)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the stacker tray up down section, and clean/repair it if any abnormality.
2. Check the connector connection and the wiring between LSCB and motor/switch, and repair it if any abnormality.
3. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram:LS-505:5-A)
4. Check the operation of the switch, and repair/replace it if any abnormality. (Wiring diagram: LS-505: 7-A)
5. Replace MS3.
6. Replace M1.
7. Replace LSCB.

Classification

FD: FD abnormality

Cause

The 1st folding cam home sensor (PS55) does not turn ON within a specified period of time after the 1st folding release motor (M14) turns ON.

Measures to take when alert occurs

The main body and the FD stop immediately to turn OFF the main relay (RL1).

Estimated abnormal parts

- 1st folding release motor (M14)
- Folding drive board (FDB)
- 1st folding cam home sensor (PS55)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the 1st folding section, and clean/repair it if any abnormality.
2. Check the connector connection and the wiring between FDB and motor/sensor, and repair it if any abnormality.
3. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram: FD-503: 1-B)
4. Check I/O and the operation of the sensor, and repair/replace it if any abnormality. (Wiring diagram: FD-503: 2-B)
5. Replace PS55.
6. Replace M14.
7. Replace FDB.

Code

C-1245

Classification

SD: SD-506 abnormality

Cause

The bundle arm home sensor (PS32) does not turn ON within a specified period of time after the bundle arm motor (M10) starts the home position search operation. Or, even after a specified period of time after M10 starts the operation, it does not stop.

Measures to take when alert occurs

The main body and the SD stop immediately to turn OFF the main relay (RL1).

Estimated abnormal parts

- Bundle arm motor (M10)
- Bundle arm home sensor (PS32)
- SD control board (SDCB)
- SD drive board (SDDB)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the bundle arm section, and clean/repair it if any abnormality.
2. Check the connector connection and the wiring between SDDB and motor/sensor, and repair it if any abnormality.
3. Check the connector connection and the wiring between SDDB and SDCB, and repair it if any abnormality.
4. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram: SD-506: 19-D)
5. Check I/O and the operation of the sensor, and repair/replace it if any abnormality. (Wiring diagram: SD-506: 17-D)
6. Replace PS32.
7. Replace M10.
8. Replace SDDB.
9. Replace SDCB.

Classification

SD: SD-506 abnormality

Cause

The bundle clip upper limit sensor (PS33) does not turn ON within a specified period of time after the bundle clip motor (M11) starts the home position search operation. Or, even after a specified period of time after M11 starts the operation, it does not stop.

Measures to take when alert occurs

The main body and the SD stop immediately to turn OFF the main relay (RL1).

Estimated abnormal parts

- Bundle clip motor (M11)
- Bundle clip upper limit sensor (PS33)
- Bundle clip lower limit sensor (PS30)
- SD control board (SDCB)
- SD drive board (SDDB)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the bundle clip section, and clean/repair it if any abnormality.
2. Check the connector connection and the wiring between SDDB and motor/sensor, and repair it if any abnormality.
3. Check the connector connection and the wiring between SDDB and SDCB, and repair it if any abnormality.
4. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram:SD-506:16-D)
5. Check I/O and the operation of the sensor, and repair/replace it if any abnormality. (Wiring diagram:SD-506:19-D)

2.11.22 C-1262**Code**

C-1262

Classification

SD: SD-506 abnormality

Cause

The stapler home sensor /Lt (HS3) or the clincher start sensor /Lt (HS4) does not turn ON even after a specified period of time after the stapler motor /Lt (M30) starts the operation.

Measures to take when alert occurs

The main body and the SD stop immediately to turn OFF the main relay (RL1).

Estimated abnormal parts

- Stapler assembly /Lt
- SD control board (SDCB)
- SD drive board (SDDB)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the stapler unit /Rt, and clean/repair it if any abnormality.
2. Check the connector connection and the wiring between SDDB and the stapler unit /Rt, and repair it if any abnormality.
3. Replacing the stapler assy /Rt
4. Replace SDDB.
5. Replace SDCB.

Classification

SD: SD-506 abnormality

Cause

It does not stop even after a specified period of time after the trimmer blade motor (M31) starts the operation.

Measures to take when alert occurs

The main body and the SD stop immediately to turn OFF the main relay (RL1).

Estimated abnormal parts

- Trimmer blade motor (M31)
- Trimmer blade home sensor (PS50)
- Trimmer blade upper limit sensor (PS51)
- SD control board (SDCB)
- SD drive board (SDDB)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the trimmer blade, and clean/repair it if any abnormality.
2. Check the connector connection and the wiring between SDDB and motor/sensor, and repair it if any abnormality.
3. Check the connector connection and the wiring between SDDB and SDCB, and repair it if any abnormality.
4. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram:SD-506:22-R)
5. Check I/O and the operation of the sensor, and repair/replace it if any abnormality. (Wiring diagram: SD-506: 23-R)
6. Replace PS50 or PS51.
7. Replace M31.
8. Replace SDDB.
9. Replace SDCB.

C-1301

Classification

LS (1st tandem): LS abnormality

Cause

An error detection signal is detected continuously for a specified period of time while the paper cooling fan motor /Fr (FM1) is ON.

Measures to take when alert occurs

The main body and the LS stop immediately to turn OFF the main relay (RL1).

Estimated abnormal parts

- Paper cooling fan motor /Fr (FM1)
- LS control board (LSCB)

Correction**Note**

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring between LSCB and the fan, and repair it if any abnormality.
2. Rotate the fan or I/O by hand, and repair it if any abnormality. (Wiring diagram: LS-505: 4-A)
3. Replace FM1.
4. Replace LSCB.

- RU control board (RUCB)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring between RUDB and the fan, and repair it if any abnormality.
2. Check the connector connection and the wiring between RUDB and RUCB, and repair it if any abnormality.
3. Rotate the fan or I/O by hand, and repair it if any abnormality. (Wiring diagram: RU-509: 19-O)
4. Replace FM7.
5. Replace RUDB.
6. Replace RUCB

Classification

RU: RU-509 abnormality

Cause

An error detection signal of FM8 is detected continuously for a specified period of time while the humidification section paper fan /3 (FM8) is ON.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay) .

Estimated abnormal parts

- Humidification section paper fan /3 (FM8)
- RU control board (RUCB)
- RU control board (RUCB)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring between RUDB and the fan, and repair it if any abnormality.
2. Check the connector connection and the wiring between RUDB and RUCB, and repair it if any abnormality.
3. Rotate the fan or I/O by hand, and repair it if any abnormality. (Wiring diagram: RU-509: 19-O)
4. Replace FM8.

PB: PB abnormality

Cause

The switchback roller release operation has not been completed within a specified period of time after the SC switchback release motor (M13) turns ON.

Measures to take when alert occurs

The main body and the PB stop immediately to turn OFF the main relay (RL1).

Estimated abnormal parts

- PB control board (PBCB)
- PB drive board (PBDB)
- SC switchback release motor (M13)

Correction

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the SC switchback release section, and clean/repair it if any abnormality.
2. Check the connector connection and the wiring between PBDB/PBDB1 and the motor, and repair it if any abnormality.
3. Check the connector connection and the wiring between PBDB/PBDB1 and PBCB, and repair it if any abnormality.
4. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram: PB-503: 6-D)
5. Replace M13.
6. Replace PBDB1.
7. Replace PBCB.

Classification

PB: PB abnormality

Cause

The SC alignment has not been completed within a specified period of time after SC alignment motor (M15) turns ON.

Measures to take when alert occurs

The main body and the PB stop immediately to turn OFF the main relay (RL1).

Estimated abnormal parts

- PB control board (PBCB)
- PB drive board (PBDB)
- SC alignment motor (M15)

Correction

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the SC alignment section, and clean/repair it if any abnormality.
2. Check the connector connection and the wiring between PBDB/PBDB1 and the motor, and repair it if any abnormality.
3. Check the connector connection and the wiring between PBDB/PBDB1 and PBCB, and repair it if any abnormality.
4. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram: PB-503:5-D)
5. Replace M15.
6. Replace PBDB1.
7. Replace PBCB.

The main body and the PB stop immediately to turn OFF the main relay (RL1).

Estimated abnormal parts

- PB control board (PBCB)
- PB drive board (PBDB)
- Booklet conveyance belt motor (M61)

Correction**Note**

- The message "Please call service" is displayed on the panel.

Solution

1. Check the booklet conveyance section, and clean/repair it if any abnormality.
2. Check the connector connection and the wiring between PBDB/PBDB1 and the motor, and repair it if any abnormality.
3. Check the connector connection and the wiring between PBDB/PBDB1 and PBCB, and repair it if any abnormality.
4. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram:PB-503: 15-D)
5. Replace M61.
6. Replace PBDB1.
7. Replace PBCB.

C-1554

Classification

PB: PB abnormality

Cause

The glue tank temperature sensor /Lw (TH4) detects an abnormal high temperature (hardware). TH4 detects an abnormal high temperature of the glue tank.

Measures to take when alert occurs

The main body and the PB stop immediately to turn OFF the main relay (RL1).

Estimated abnormal parts

- AC drive board (ACDB)
- Glue tank heater (H1)
- Glue apply roller heater (H2)
- PB control board (PBCB)
- PB drive board (PBDB)
- Glue apply roller motor (M32)
- Glue tank temperature sensor /Lw (TH4)

Correction

Be sure to change the software DIPSW3-1 from 1 to 0 and turn OFF/ON the sub power switch (SW2) of the main body after fixing the defective parts.

WARNING

- If DipSW3-1 is set to 0 before defective parts are fixed, it causes fire.

Solution

1. Check the glue tank heater, and clean/repair it if any abnormality.
2. Check the connector connection and the wiring between PBCB and the temperature sensor, and repair it if any abnormality.
3. Check the connector connection and the wiring between ACDB and the heater, and repair it if any abnormality.
4. Check the installation conditions of the heater and the temperature sensor, and repair/replace it if any abnormality. (Wiring diagram: PB-503: 27-Q, 10-U)
5. Replace TH4.

6. Replace H1.
7. Replace ACDB.
8. Replace PBCB.

C-2101

Classification

Main body: Wire cleaning abnormality

Cause

Charger cleaning motor (M23) operation time abnormality.

- When the charger cleaning home sensor (PS26) is OFF with the main power switch (SW1) ON, PS26 does not turn ON within 20 seconds after the M23 turns ON for home position research operation (return operation). At this time, an error detection signal (blowout of ICP) is not detected.
- PS26 does not turn OFF within 5 seconds after the reverse operation (return operation) is started. At this time, an error detection signal (blowout of ICP) is not detected.
- The charge cleaning limit sensor (PS27) does not turn ON within a specified period of time after the reverse operation (return operation) is started for detection of PS26 being OFF. Or, PS26 does not turn ON within a specified period of time after PS27 turns ON. At this time, an error detection signal (blowout of ICP) is not detected.
- When PS26 and PS27 are ON at the start of cleaning operation

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay).

Estimated abnormal parts

- Charger cleaning limit sensor (PS26)
- Charger cleaning limit sensor (PS27)
- Charger cleaning motor (M23)
- Web motor (M24)
- Printer control board (PRCB)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring between PRCB and motor/sensor, and repair it if any abnormality.
2. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram: Main body (3/4): 16-I, 3-A)
3. Check I/O and the operation of the sensor, and repair/replace it if any abnormality. (Wiring diagram: Main body (3/4): 16-I, 17-I)
4. Replace PS26 or PS27.
5. Replace M23 or M24.

- PS26 does not turn OFF within 5 seconds after the reverse operation (return operation) is started. And at this time, an error detection signal (blowout of ICP) is detected.
- The charge cleaning limit sensor (PS27) does not turn ON within a specified period of time after the reverse operation (return operation) is started for detection of PS26 being OFF. Or, PS26 does not turn ON within a specified period of time after PS26 turns ON. At this time, an error detection signal (blowout of ICP) is detected.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay).

Estimated abnormal parts

- Charger cleaning motor (M23)
- Web motor (M24)
- Printer control board (PRCB)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring between PRCB and the motor, and repair it if any abnormality
2. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram: Main body (3/4): 16-I, Main body (2/4): 3-A)
3. Replace M23, M24 and PRCB.

Faulty part isolation DIPSW**Control while detached****2.17.3 C-2103****Code**

C-2103

Classification

Main body: Wire cleaning abnormality

Cause

Charger cleaning motor (M23) drive abnormality.

A motor lock signal is detected while moving from the charger cleaning limit sensor (PS27) side to the charge cleaning home sensor (PS26) side, and after a retry operation, a fifth motor lock signal is detected.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay).

Estimated abnormal parts

- Charger cleaning motor (M23)
- Printer control board (PRCB)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring between PRCB and the motor, and repair it if any abnormality.
2. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram: Main body (3/4): 16-I)
3. Replace M23.
4. Replace PRCB.

Faulty part isolation DIPSW**Control while detached****2.17.4 C-2201****Code**

Classification

Main body: Motor abnormality

Cause

Toner bottle motor (M6) speed abnormality.

An error detection signal is detected twice in succession within a specified period of time after M6 was turned ON.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay).

Estimated abnormal parts

- Toner bottle motor (M6)
- Printer control board (PRCB)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the toner bottle installation section, and clean/repair it if any abnormality.
2. Check the connector connection and the wiring between PRCB and the motor, and repair it if any abnormality.
3. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram:Main body (3/4): 7-D, 9-P)
4. Replace M6.
5. Replace PRCB.

Main body: Motor abnormality

Cause

The transfer belt motor (M30) rotation abnormality.

The M30EM error detection signal is detected twice in succession within a specified period of time after M30 was turned ON. However, an error detection signal (blowout of ICP) is not detected.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay).

Estimated abnormal parts

- Transfer belt motor (M30)
- ADU drive board (ADUDB)
- Printer control board (PRCB)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the transfer belt, and clean/repair it if any abnormality.
2. Check the connector connection and the wiring between PRCB and the motor, and repair it if any abnormality.
3. Check the connector connection and the wiring between ADUDB and the motor, and repair it if any abnormality.
4. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram:Main body (2/4): 6-P)
5. Replace M30.
6. Replace PRCB.
7. Replace ADUDB.

Classification

Main body: Motor abnormality

Cause

Waste toner box swing motor (M19) drive abnormality.

The waste toner box swing sensor (PS15) ON or OFF is not detected twice in succession within a specified period of time after M19 turns ON.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay).

Estimated abnormal parts

- Waste toner box swing sensor (PS15)
- Waste toner box swing motor (M19)
- Printer control board (PRCB)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the waste toner box swing section, and clean/repair it if any abnormality.
2. Check the connector connection and the wiring between PRCB and motor/sensor, and repair it if any abnormality.
3. Check I/O and the operation of the sensor, and repair/replace it if any abnormality. (Wiring diagram: Main body (3/4): 7-P)
4. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram: Main body (3/4): 11-P)
5. Replace PS15.
6. Replace M19.
7. Replace PRCB.

Classification

Main body: Motor abnormality

Cause

De-curler motor (M32) rotation abnormality.

The M32EM error detection signal is detected twice in succession within a specified period of time after M32 was turned ON, and the main door detection is Close.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay).

Estimated abnormal parts

- De-curler motor (M32)
- ADU drive board (ADUDB)
- Printer control board (PRCB)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the de-curler section, and clean/repair it if any abnormality.
2. Check the connector connection and the wiring between PRCB and the motor, and repair it if any abnormality.
3. Check the connector connection and the wiring between ADUDB and the motor, and repair it if any abnormality.
4. Check the I/O drive of the motor and the coupling of the gear, and repair/replace it if any abnormality. (Wiring diagram: Main body (2/4): 4-P)

Main body: High voltage power source abnormality

Cause

A charge leak is detected.

After a charge EM signal abnormality is detected while in the charge ON, up to 5 charge ON/OFF operations occur in succession while in 10 prints.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay).

Estimated abnormal parts

- Charging corona
- High voltage unit /1 (HV1)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Clean the power feed section for the charger.
2. Check the charger (charging wire and the grid), and clean/repair it if there is any dirt or abnormality.
3. Check the connector connection and the wiring between HV1 and the charger, and repair it if any abnormality. (Wiring diagram: Main body (3/4): 22-K).
4. Replace HV1.

Faulty part isolation DIPSW

Control while detached

2.18.16 C-2702

Code

C-2702

Classification

Main body: High voltage power source abnormality

Cause

A transfer leak is detected.

After a transfer EM signal abnormality is detected while in the charge ON, up to 5 transfer ON/OFF operations occur in succession while in 10 prints.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay).

Estimated abnormal parts

- Transfer roller
- High voltage unit /2 (HV2)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the transfer roller section, and clean/repair it if there is sensor dirt or any abnormality.
2. Clean the power feed section for the transfer roller.
3. Check the transfer roller pressure section, and clean/repair it if there is sensor dirt or any abnormality.
4. Check the connector connection and the wiring between HV2 and the power feed section, and repair/replace it if any abnormality. (Wiring diagram: Main body (2/4): 3-N)
5. Replace HV2.

Faulty part isolation DIPSW

Control while detached

2.18.17 C-2704

Code

C-2704

Classification

Main body: High voltage power source abnormality

Cause

24V high voltage power abnormality.

An error detection signal (blowout of ICP) of 24V high voltage power is detected. At this time, the main door detection and the PFU door detection are Close.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay) .

Estimated abnormal parts

- High voltage unit /2 (HV2)
- ADU drive board (ADUDB)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring between ADUDB and HV2, and repair/replace it if any abnormality.
2. Replace ADUDB and HV2 at a time.

Faulty part isolation DIPSW

Control while detached

2.18.18 C-2705**Code**

C-2705

Classification

Main body: High voltage power source abnormality

Cause

PCC leak is detected.

After a PCC EM signal abnormality is detected while in the PCC ON, up to 5 transfer ON/OFF operations occur in succession while in 10 prints.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay).

Estimated abnormal parts

- PCC unit
- High voltage unit /3 (HV3)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the discharging wire of the PCC unit and replace it if the wire is cut
2. Check the installation condition of the PCC unit and install it again if any abnormality.
3. Check the connector connection and the wiring between HV3 and the power feed section, and repair/replace it if any abnormality.
(Wiring diagram: Main body (3/4): 21-K)
4. Replace HV3.

Faulty part isolation DIPSW**Control while detached****2.18.19 C-2801****Code**

C-2801

Classification

Main body: Process abnormality

Cause

IDC sensor (TCB) dirt correction abnormality.

While in the maximum density correction (Dmax), the IDC sensor (TCB) dirt correction abnormality is detected 10 times in succession.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay).

Estimated abnormal parts

- Toner control board (TCB)
- Printer control board (PRCB)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check TCB, and clean it with alcohol if there is IDC sensor dirt or any abnormality. (Wiring diagram: Main body (3/4): 18-I)
Be sure to clean TCB with alcohol, otherwise replacement of TCB is required.
2. Check the developing section, and clean/repair it if there is sensor dirt or any abnormality.
3. Check the connector connection and the wiring between PRCB and TCB, and repair it if any abnormality.
4. Replace TCB.
5. Replace PRCB.

C-2802

Classification

Main body: Process abnormality

Cause

The maximum density correction (Dmax) is not completed.

While in Dmax, the number of rotations of the developing sleeve gets to the maximum.

Measures to take when alert occurs

Error code is not displayed on the operation panel, but displayed only on the data collection, the list output and CSRC.

Estimated abnormal parts

- Developing motor (M3)
- Toner control board (TCB)
- Printer control board (PRCB)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check TCB, and clean it with alcohol if there is IDC sensor dirt or any abnormality. (Wiring diagram: Main body (3/4): 18-I)
Be sure to clean TCB with alcohol, otherwise replacement of TCB is required.
2. Check the connector connection and the wiring between PRCB and TCB, and repair it if any abnormality.
3. Check the I/O drive of the motor and the coupling of the gear, and clean/repair/replace it if any abnormality. (Wiring diagram: Main body (3/4): 16-P)
4. Replace TCB.
5. Replace M3.
6. Replace PRCB.

Error code is not displayed on the operation panel, but displayed only on the data collection, the list output and CSRC.

Estimated abnormal parts

- Developer
- High voltage unit /1 (HV1)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Clean the power feed section for the developing sleeve.
2. Check the developer, and clean/repair it if there is any adhesion or abnormality.
3. Check the connector connection and the wiring between HV1 and the developing sleeve, and repair it if any abnormality. (Wiring diagram: Main body (3/4): 22-K).
4. Replace HV1.

Faulty part isolation DIPSW**Control while detached****2.18.30 C-2816****Code**

C-2816

Classification

Main body: Process abnormality

Cause

Drum charger capacity deterioration.

When the charger grid/developing bias is in excess of the limit of correction, lower the developing potential/fogging margin potential in steps of 50V. As a result, less than 50V of the difference with the target charger potential is detected 10 times in succession.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay).

Estimated abnormal parts

- Drum potential sensor (DPS)
- Drum potential sensor board (DPSB)
- Charging corona
- High voltage unit /1 (HV1)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Clean the power feed section for the charger.
2. Check the DPS, and clean/replace it if any abnormality or dirt on sensor (Wiring diagram: Main body (3/4): 19-J)
3. Check the charger (charging wire and the grid), and clean/repair it if there is any dirt or abnormality.
4. Check the drum, and clean/repair it if there is any dirt or abnormality.
5. Check the connector connection and the wiring between HV1 and the charger, and repair it if any abnormality. (Wiring diagram: Main body (3/4): 22-K).
6. Replace DPS.
7. Replace DPSB.
8. Replace the drum.
9. Replace HV1.

C-3501

Classification

Main body: Fusing high temperature abnormality

Cause

Thermistor /1 (TH1) high temperature abnormality (software).

TH1 detects a temperature of 244°C or above 10 times in a period of 0.5second.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay).

Estimated abnormal parts

- Fusing temperature sensor /1 (TH1)
- Fusing heater lamp /1 (L1)
- Fusing heater lamp /2 (L2)
- Printer control board (PRCB)
- AC drive board (ACDB)

Correction

Be sure to change the software DIPSW3-1 from 1 to 0 and turn OFF/ON the sub power switch (SW2) of the main body after fixing the defective parts.

Note

- If DIPSW3-1 is set to 0 before defective parts are fixed, it may cause fire.

Solution

1. Check the fusing heater lamp /1 and /2 (L1 and L2), and clean/repair them if any abnormality. (Wiring diagram: Main body (1/4): 2-A, Main body (1/4): 3-A)
2. Check the connector connection and the wiring between PRCB and TH1, and repair it if any abnormality.
3. Check the connector connection and the wiring between ACDB and L1/L2, and repair it if any abnormality.
4. Check TH1 to see the installed position or distance to the fusing roller /Up, and adjust/replace it if any abnormality. (Wiring diagram: Main body (3/4): 11-I (S1/S2), 11-F (S3)).
5. Replace TH1.
6. Replace L1 and L2.
7. Replace PRCB.
8. Replace ACDB.

C-3503

Classification

Main body: Fusing high temperature abnormality

Cause

Thermistor /1 (TH1) high temperature abnormality (hardware).
 TH1 detects the fusing abnormality detection 1.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay).

Estimated abnormal parts

- Fusing temperature sensor /1 (TH1)
- Fusing heater lamp /1 (L1)
- Fusing heater lamp /2 (L2)
- Printer control board (PRCB)
- AC drive board (ACDB)

Correction

Be sure to change the software DIPSW3-1 from 1 to 0 and turn OFF/ON the sub power switch (SW2) of the main body after fixing the defective parts.

Note

- If DIPSW3-1 is set to 0 before defective parts are fixed, it may cause fire.

Solution

1. Check the fusing heater lamp /1 and /2 (L1 and L2), and clean/repair them if any abnormality. (Wiring diagram: Main body (1/4): 2-A, 3-A)
2. Check the connector connection and the wiring between PRCB and TH1, and repair it if any abnormality.
3. Check the connector connection and the wiring between ACDB and L1/L2, and repair it if any abnormality.
4. Check TH1 to see the installed position or distance to the fusing roller /Up, and adjust/replace it if any abnormality. (Wiring diagram: Main body (3/4): 11-I (S1/S2), 11-F (S3)).
5. Replace TH1.

6. Replace L1 and L2.
7. Replace PRCB.
8. Replace ACDB.

C-4301

Classification

Main body: Fan abnormality

Cause

Image processing cooling fan (FM12) rotation abnormality + 24V power abnormality.

The abnormal status is detected twice in succession after FM12 was turned ON. At this time, an error detection signal (24V cut off) is detected.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay).

Estimated abnormal parts

- DC power supply /2 (DCPS/2)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring between ACDB and DCPS /2, and repair it if any abnormality.
2. Replace DCPS /2

Faulty part isolation DIPSW**Control while detached****2.19.2 C-4303****Code**

C-4303

Classification

Main body: Fan abnormality

Cause

Image processing cooling fan (FM12) rotation abnormality 1.

The FM12 EM error detection signal is detected twice in succession within a specified period of time after FM12 was turned ON. However, error detection signal (24V cut off) is not detected.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay).

Estimated abnormal parts

- Image processing cooling fan (FM12)
- Printer control board (PRCB)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring between PRCB and the fan, and repair it if any abnormality.
2. Rotate the fan or I/O by hand, and repair it if any abnormality. (Wiring diagram: Main body (2/4): 8-A)
3. Replace FM12.
4. Replace PRCB.

Memory time out.

- The expansion processing from the memory to the page memory does not terminate.
- The compression processing from the page memory to the memory does not terminate.
- The development from the memory to the page memory does not terminate.
- The transmission of the compressed data from memory to memory does not terminated.

Measures to take when alert occurs

If there is a sheet of paper being printed, the main body completes the paper exit before stopping operations and turning OFF the RL1 (the main relay).

Estimated abnormal parts

- Overall control board (OACB)
- Printer control board (PRCB)
- Image processing board (IPB)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please turn on power again" is displayed on the touch panel.

Solution

1. Check the connector connection and the wiring on IPB and OACB, and repair it if any abnormality.

2. Check the connector connection and the wiring on PRCB, and repair it if any abnormality.
3. Check the connector connection and the wiring between IPB and OACB/between OACB and PRCB, and repair it if any abnormality.
4. Rewrite the firmware for image control.
5. Replace IPB.
6. Replace OACB.
7. Replace PRCB.

2.19.15 C-4720

Code

C-4720

Classification

Main body: Image processing abnormality

Cause

Shift amount abnormality while in the repeat.

When the shift amount (used for cutting margin, etc.) while in the repeat is negative (-).

Measures to take when alert occurs

Error code is not displayed on the operation panel, but displayed only on the data collection, the list output and CSRC.

Estimated abnormal parts

- Image processing board (IPB)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring on IPB, and repair it if any abnormality.
2. Rewrite the firmware for image control.
3. Replace IPB.

2.19.17 C-4722

Code

C-4722

Classification

Main body: Image processing abnormality

Cause

The creation of the PWM gamma curve failed.

A PWM gamma curve is not created properly.

Measures to take when alert occurs

Error code is not displayed on the operation panel, but displayed only on the data collection, the list output and CSRC.

Estimated abnormal parts

- Toner control board (TCB)
- Printer control board (PRCB)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check TCB, and clean it with alcohol if there is IDC sensor dirt or any abnormality.
* Be sure to clean TCB with alcohol, otherwise replacement of TCB is required.
2. Check the developing section, and clean/repair it if there is sensor dirt or any abnormality.
3. Check the connector connection and the wiring between PRCB and TCB, and repair it if any abnormality.
4. Replace TCB.
5. Replace PRCB.

Main body: Fan abnormality

Cause

Toner bottle cooling fan (FM35) rotation abnormality + 24V power abnormality.

The FM35EM error detection signal is detected twice in succession within a specified period of time after FM35 was turned ON. At this time, an error detection signal (24V cut off) is detected.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay).

Estimated abnormal parts

- DC power supply /2 (DCPS/2)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring between ACDB and DCPS /2, and repair it if any abnormality.
2. Replace DCPS /2

Classification

Main body: Fan abnormality

Cause

Toner bottle cooling fan (FM35) rotation abnormality 1.

The FM35EM error detection signal is detected twice in succession within a specified period of time after FM35 was turned ON. At this time, an error detection signal (24V cut off) is not detected.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay).

Estimated abnormal parts

- Toner bottle cooling fan (FM35)
- Printer control board (PRCB)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring between PRCB and the fan, and repair it if any abnormality.
2. Rotate the fan or I/O by hand, and repair it if any abnormality. (Wiring diagram: Main body (2/4): 15-A)
3. Replace FM35.
4. Replace PRCB.

2.20.5 C-8301**Code**

C-8301

Classification

DF: DF abnormality

Cause

Cooling fan /Lt (FM301) and /Rt (FM302) abnormality

Measures to take when alert occurs

If there is a sheet of paper being printed, the main body completes the paper exit before stopping operations and turning OFF the RL1 (the main relay).

Estimated abnormal parts

- Cooling fan /Lt (FM301: DF-615/616)
- Cooling fan /Rt (FM302: DF-615/616)
- DF control board (DFCB: DF-615/616)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the connector connection and the wiring between DFCB and the fan, and repair it if any abnormality.
2. Rotate the fan by I/O or hand, and repair it if any abnormality. (Wiring diagram: RU-615/616: 7-F, 8-B)
3. Replace FM301 or FM302.
4. Replace DFCB

ISW time out error.

No normal header is transmitted within a specified period of time after ISW is started.

Measures to take when alert occurs

The main body and option stop immediately to turn OFF the RL1 (the main relay).

Estimated abnormal parts

- Image processing board (IPB)
- Overall control board (OACB)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please call service" is displayed on the panel.

Solution

1. Check the I/F connector connection and the wiring for ISW on IPB, and repair it if any abnormality.
2. Check the connector connection and the wiring between IPB and OACB, and repair it if any abnormality. (Wiring diagram: Main body (4/4): 9-G, Main body (1/4): 11-N)
3. Reinstalling firmware
4. Replace OACB.

Header readout address abnormality.

Measures to take when alert occurs

If there is a sheet of paper being printed, the main body completes the paper exit before stopping operations and turning OFF the RL1 (the main relay).

Estimated abnormal parts

- Overall control board (OACB)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please turn on power again" is displayed on the touch panel.

Solution

1. After turning OFF the sub power switch, turn OFF the main power switch and unplug the power plug. Restart the main body after 10 seconds.
2. Reinstall the firmware related to the overall control.
3. Replace OACB.

Faulty part isolation DIPSW**Control while detached****2.22.18 C-E007****Code**

C-E007

Classification

HDD: Communication error

Cause

DRAM memory abnormality.

An error is detected in the DRAM memory check at the start.

Measures to take when alert occurs

If there is a sheet of paper being printed, the main body completes the paper exit before stopping operations and turning OFF the RL1 (the main relay).

Estimated abnormal parts

- Overall control board (OACB)

Correction

Turn OFF/ON the sub power switch (SW2) of the main body when releasing an abnormal condition.

Note

- The message "Please turn on power again" is displayed on the touch panel.

Solution

1. After turning OFF the sub power switch, turn OFF the main power switch and unplug the power plug. Restart the main body after 10 seconds.
2. Reinstall the firmware related to the overall control.
3. Replace OACB.

Faulty part isolation DIPSW**Control while detached**

3. TROUBLES THAT DO NOT DISPLAY THE MALFUNCTION CODE

3.1 The power of main body does not turn ON

3.1.1 Turn ON the main power switch but the power LED of the operation panel does not light up in red.

Target parts for trouble				
Noise filter /2 (NF2) Main power switch (SW1) Circuit breaker (CBR)		DC power supply /1 (DCPS/1) Overall control board (OACB)		
Procedure	Check item	Location (Electrical parts)	Result	Action
1	Disconnect the plug from the outlet. Ask the administrator on the user side to check the state of the power of the outlet, and the power has no trouble. * Be sure not to overuse the power of the outlet including the other connected machines.	Main body (1/4):1-K	NO	Ask the administrator on the user side for the repair.
2	Wiring from the plug to CBR is connected properly.	Main body (1/4):1-K	NO	Repair the wiring.
3	Wiring from CBR to DCPS/1 is connected properly.	Main body (1/4):2-K	NO	Repair the wiring.
4	After checking that the plug is not connected to the outlet, scale the resistance value on both edge of the plug and it is 0Ω.	Main body (1/4):1-K	YES	Check the cause of the short on the wiring from the plug to the DC power supply board, and repair it.
5	The switch of CBR is OFF.	-	YES	Go on to step 6.
			NO	Go on to step 7.
6	Turn ON the switch of CBR.	-	NO	Replace CBR
7	Connect the plug to the outlet and find that any irregular sound from the machine or the error on the board does not occur.	-	NO	Remove the plug from the outlet, check the cause of the error, and repair it.
8	The fuse of DCPS/1 has the conduction.	-	NO	Replace DCPS/1
9	The voltage of CN77-1 and CN77-2 of DCPS/1 is DC36V.	Main body (1/4):20-K	NO	Replace DCPS/1
10	The voltage of CN74-1 to CN74-18 of DCPS/1 is 24VDC.	Main body (1/4):17-K	NO	Replace DCPS/1
11	The voltage of CN73-2 and CN73-3 of DCPS/1 is 12VDC.	Main body (1/4):16-K	NO	Replace DCPS/1
12	The voltage of CN72-1 and CN72-2 of DCPS/1 is 5VDC.	Main body (1/4):15-K	NO	Replace DCPS/1
13	Wiring from DCPS/1 to OACB is connected properly.	-	NO	Repair the wiring.
14	Wiring from OACB to the operation panel is connected properly.	Main body (4/4): 1-H, 2-H, 3-H, 4-H, 5-H	YES	Replace OACB
			NO	Repair the wiring inside the operation panel. Replace the board inside the operation panel.

3.1.2 Turn ON the main power switch and the sub power switch, but the touch panel does not display anything.

- The power save LED is lighting/blinking, but the main power LED does not light in green (but lights in red).

Target parts for trouble				
Main power switch (SW1)		Overall control board (OACB)		
Procedure	Check item	Location (Electrical parts)	Result	Action
1	The power save LED blinks in green.	-	YES	Processing ISW Do not turn OFF the main power.
2	The power save LED blinks in orange.	-	YES	Reinstall the firmware because of the firmware writing error of the OACB.
			NO	Check "Turn ON the main power switch but the power LED of the operation panel does not light up in red".

3.1.3 Turn ON the sub power switch but the power LED does not switch from red to green.

Target parts for trouble	
Sub power switch (SW2)	Overall control board (OACB)

Procedure	Check item	Location (Electrical parts)	Result	Action
1	The power LED is lighting in red.	-	NO	Refer to the main power switch related trouble
2	The terminal voltage of the red wiring of SW2 changes from DC5V to DC0V by turning ON SW-2 from OFF.	Main Body (4/4): 16-C	YES	Replace OACB
			NO	Repair the wiring between OACB and SW2.

3.2 The power is not supplied to DF-615/616.

Target parts for trouble				
DC power supply /2 (DCPS/2: main body)		DF control board (DFCB: DF)		
Procedure	Check item	Location (Electrical parts)	Result	Action
1	The voltage of CN1-3 of DFCB is 24VDC.	DF: 4-A	YES	Trouble in DF Confirmation of DFCB connector Replace DFCB
2	The voltage of CN21-1 of DCPS/2 is 24VDC.	Main body (1/4):17-A	YES	Repair the wiring from DCPS/2 to DF.
			NO	Replace DCPS/2

3.3 The power is not supplied to the paper feed option.

3.3.1 PF-703/706

Target parts for trouble				
DC power supply /1 (DCPS/1: main body)		PF drive board (PFUDB: PF)		
DC power supply /2 (DCPS/2: main body)		-		
Procedure	Check item	Location (Electrical parts)	Result	Action
1	The front door of PF is open.	-	YES	Close the front door.
2	Using the tandem PF.	-	YES	Go on to step 3.
			NO	Go on to step 9.
3	The PF connecting terminal of the 1st tandem has voltage outputs for DC36V, DC24V, DC12V and DC5V.	PF: 2-G	YES	Go on to step 9.
			NO	Go on to step 4.
4	The PF connecting terminal of the main body has voltage outputs for DC24V, DC12V, and DC5V.	Main body (1/4): 20-D	YES	Go on to step 5.
			NO	Go on to step 7.
5	The PF connecting terminal of the main body has voltage output for DC36V.	Main body (1/4): 20-D	YES	Go on to step 8.
			NO	Go on to step 6.
6	The wiring from DCPS /1 to the PF connecting terminal is connected properly.	Main body (1/4):16-K	YES	Repair the wiring.
			NO	Replace DCPS1
7	The wiring from DCPS /2 to the PF connecting terminal is connected properly.	Main body (1/4): 15-A, 18-A	YES	Repair the wiring.
			NO	Replace DCPS2
8	The wiring from the main body connecting terminal in the 1st PF-703 to the PF connecting terminal in the 2nd PF is connected properly.	PF: 2-B	NO	Repair the wiring.
			NO	Repair the wiring.
9	The wiring from PF connecting terminal to PFUDB is connected properly.	PF: 3-I	YES	Repair the wiring.
			NO	Replace PFUDB

3.3.2 LU-409/410

Target parts for trouble				
DC power supply /2 (DCPS/2: main body)		LU drive board (LUDB: LU)		
Procedure	Check item	Location (Electrical parts)	Result	Action
1	The front door of LU is open.	-	YES	Close the front door.
2	The LU connecting terminal of the Main Body has voltage outputs for 24VDC and 5VDC.	LU: 2-G	YES	Go on to step 5.
			NO	Go on to step 3.
3	The LU connecting terminal of the main body has voltage outputs for 24VDC and 5VDC.	Main body (1/4): 20-D	YES	Go on to step 5.
			NO	Go on to step 4.
4	The wiring from DCPS /2 to the LU connecting terminal is connected properly.	Main body (1/4): 15-A, 18-A	YES	Repair the wiring.
			NO	Replace DCPS2

5	The wiring from LU connecting terminal to LUDB is connected properly.	LU: 3-I	YES	Repair the wiring.
			NO	Replace LUDB.

3.4 The power is not supplied to the finishing option.

3.4.1 PF-703 + FA-501

Target parts for trouble				
DC power supply /1 (DCPS/1: main body)		PF drive board (PFUDB: PF)		
DC power supply /2 (DCPS/2: main body)		-		
Procedure	Check item	Location (Electrical parts)	Result	Action
1	The front door of PF is open.	-	YES	Close the front door.
2	The PI-PFU connecting terminal of the main body has voltage outputs for DC24V, DC12V, and DC5V.	Main body (1/4): 20-B	YES	Go on to step 3.
			NO	Go on to step 4.
3	The PI-PFU connecting terminal of the main body has voltage outputs for DC36V.	Main body (1/4): 20-B	YES	Go on to step 5.
			NO	Go on to step 6.
4	The wiring from DCPS /1 to the PI-PFU connecting terminal is connected properly.	Main body (1/4): 16-K	YES	Repair the wiring.
			NO	Replace DCPS1
5	The wiring from DCPS /2 to the PI-PFU connecting terminal is connected properly.	Main body (1/4): 17-A, 18-A	YES	Repair the wiring.
			NO	Replace DCPS2
6	The wiring from the main body connecting terminal to PFUDB is connected properly.	PF: 16-A	YES	Repair the wiring.
			NO	Replace PFUDB

3.4.2 RU-509

Target parts for trouble				
DC power supply (DCPS: RU-509)		RU control board (RUCB: RU-509)		
Step	Check item	Wiring diagram location	Result	Action
1	The front door of RU-509 is open.	-	YES	Close the front door.
2	The voltage of CN1-5 of RUCB is 5V DC.	RU: 4-D	YES	Trouble in RU Confirmation of RUCB connector Replace RUCB
3	Wiring from the main body to RU is connected properly.	-	NO	Repair the wiring.
4	The wiring from RU-509 AC power supply to DCPS and the wiring switchover have no trouble.	-	NO	Repair the AC power supply wiring.
5	The switch of CBR is OFF.	-	YES	Go on to step 6.
			NO	Go on to step 7.
6	Turn ON CBR.	-	NO	Replace CBR
7	The fuse of DCPS has the conduction.	-	NO	Replace DCPS
8	Connect the plug of the main body to the outlet and ensure that any irregular sound inside RU or the error on the board does not occur.	-	NO	Remove the plug from the outlet, check the cause of the error, and repair it.
9	The voltage between CN1-1 and CN1-2 of RUCB is DC24V.	RU: 4-D	YES	Replace RUCB.
			NO	Replace DCPS

3.4.3 RU-510

Target parts for trouble				
DC power supply /2 (DCPS/2: main body)		RU control board (RUCB: RU)		
Procedure	Check item	Location (Electrical parts)	Result	Action
1	The front door of RU is open.	-	YES	Close the front door.
2	The voltages of CN1-4 and CN1-5 of RUCB are 5V DC.	RU: 7-F	YES	Trouble in RU Confirmation of RUCB connector Replace RUCB
3	Wiring from the main body to RU is connected properly.	-	NO	Repair the wiring.

3.4.4 FS-532

Target parts for trouble				
DC power supply /2 (DCPS/2: main body)		FNS control board (FNSCB: FS)		

Procedure	Check item	Location (Electrical parts)	Result	Action
1	The front door of FS is open.	-	YES	Close the front door.
2	The voltage of CN2-1 and CN2-4 of FNSCB is 24VDC.	FS: 7-E	YES	Trouble in FS Confirmation of FNSCB connector Replace FNSCB.
3	Wiring from the main body to FS is connected properly.	-	NO	Repair the wiring.
4	The voltage of CN21-2 of DCPS2 is DC24V and the voltage of CN14-2 to 4 of DCPS2 is DC5V.	Main body (1/4): 17-A, 18-A	YES	Repair the wiring from DCPS2 to the finishing option connecting terminal.
			NO	Replace DCPS2

3.4.5 LS-505

Target parts for trouble				
DC power supply (DCPS: LS)		LS control board (LSCB: LS)		
Procedure	Check item	Wiring diagram location	Result	Action
1	The voltage between CN26-2 and CN26-3 of LSCB is DC5V.	LS: 8-F	NO	Repair the wiring between the main body and LS.
2	The wiring from the main body AC power supply to LS DCPS and the wiring switchover have no trouble.	LS: 9-F	NO	Repair the AC power supply wiring.
3	The switch of CBR is OFF.	-	YES	Go on to step 4.
			NO	Go on to step 5.
4	Turn ON CBR.	-	NO	Replace CBR
5	The fuse of DCPS has the conduction.	-	NO	Replace DCPS
6	Connect the plug of the main body to the outlet and ensure that any irregular sound inside LS or the error on the board does not occur.	-	NO	Remove the plug from the outlet, check the cause of the error, and repair it.
7	The voltage of CN27-1 and 2 of LSCB is DC24V.	LS: 8-F	YES	Replace LSCB
			NO	Replace DCPS
8	The voltage among the relay board, CN2-1 and CN2-2 is DC5V.	LS-9:-H	NO	Repair the wiring between the board and the relay.

3.4.6 FD-503

Target parts for trouble				
Circuit breaker /1 (CBR1: FD) Circuit breaker /2 (CBR2: FD)		DC power supply (DCPS: FD) FD control board (FDCB: FD)		
Procedure	Check item	Wiring diagram location	Result	Action
1	The front door of FD is open.	-	YES	Close the front door.
2	The voltage between CN20-1 and CN20-3 of FDCB is DC5V.	FD: 5-G	NO	Repair the wiring between the main body and FD.
3	The wiring from the main body AC power supply to FD DCPS and the wiring switchover have no trouble.	FD: 1-H	NO	Repair the AC power supply wiring.
4	The switches of CBR1 and CBR2 are OFF.	FD: 2-H	YES	Go on to step 5.
			NO	Go on to step 6.
5	Turn ON the switches of CBR1 and CBR2 from OFF.	-	NO	Replace CBR1 or CBR2
6	The fuse of DCPS has the conduction.	-	NO	Replace DCPS
7	Connect the plug of the main body to the outlet and find that any irregular sound inside FD or the error on the board does not occur.	-	NO	Remove the plug from the outlet, check the cause of the error, and repair it.
8	The voltage of CN205-1 and 2 or 3 and 4 of FDCB are 24VDC.	FD: 7-F	YES	Replace FDCB
			NO	Replace DCPS

3.4.7 SD-506

Target parts for trouble	
Circuit breaker /1 (CBR1: SD) Circuit breaker /2 (CBR2: SD)	DC power supply /1 (DCPS1: SD) DC power supply /2 (DCPS2: SD) DC power supply /3 (DCPS3: SD) SD control board (SDCB: SD)

SD drive board (SDDB: SD)				
Procedure	Check item	Wiring diagram location	Result	Action
1	The front door of SD is open.	-	YES	Close the front door.
2	The voltage between CN20-1 and CN20-3 of SDCB is DC5V.	SD: 5-D	NO	Repair the wiring between the main body and SD.
3	The wiring from the main body AC power supply to SD DCPS and the wiring switchover have no trouble.	SD: 12-T	NO	Repair the AC power supply wiring.
4	The switches of CBR1 and CBR2 are OFF.	SD: 13-T	YES	Go on to step 5.
			NO	Go on to step 6.
5	Turn ON the switches of CBR1 and CBR2 from OFF.	-	NO	Replace CBR1 or CBR2
6	The fuses of DCPS1, DCPS2 and DCPS3 have the conduction.	-	NO	Replace the DC power supply without conduction of the fuse.
7	Connect the plug of the main body to the outlet and ensure that any irregular sound inside SD or the error on the board does not occur.	-	NO	Remove the plug from the outlet, check the cause of the error, and repair it.
8	The voltage of CN101-1 to CN101-3 of SDDB is DC24V.	SD: 19-M	NO	Replace DCPS1
9	The voltage of CN162-1 to CN162-3 of SDDB is DC24V.	SD: 20-M	NO	Replace DCPS2
10	The voltage of CN163-1 to CN163-3 of SDDB is DC24V.	SD: 21-M	YES	Replace SDDB
			NO	Replace DCPS3

3.4.8 PB-503

Target parts for trouble				
Circuit breaker (CBR: PB-503) DC power supply /1 (DCPU/1: PB-503) DC power supply /2 (DCPU/2: PB-503) DC power supply /3 (DCPU/3: PB-503)		PB drive board /1 (PBDB1: PB-503) PB drive board /2 (PBDB2: PB-503) PB drive board /3 (PBDB3: PB-503) PB control board (PBCB: PB-503) AC drive board (ACDB: PB-503)		
Step	Check item	Wiring diagram location	Result	Action
1	The front door of PB is open.	-	YES	Close the front door.
2	The voltage between CN1-1 and CN1-3 of PBCB is DC5V.	PB:25-N	NO	Repair the wiring between the main body and PB.
3	Wiring from the plug of PB to CBR is connected properly.	PB:24-B	NO	Repair the AC power supply wiring.
4	The switch of CBR is OFF.	PB:25-B	YES	Go on to step 5.
			NO	Go on to step 6.
5	Turn ON CBR.	-	NO	Replace CBR
6	The fuses of DCPU/1, DCPU/2 and DCPU/3 have the conduction.	-	NO	Replace the DC power supply without conduction of the fuse.
7	The wiring from PBDB1 to DCPU/1, DCPU/2 and DCPU/3 has no trouble.	PB:24-F	NO	Repair the wiring.
8	There is power output of DC 24V for CN45-2 and 3 of PB ACDB.	PB:28-M	NO	Check the wiring. Replace ACDB (PB).
9	Connect the plug of the main body to the outlet and find that any irregular sound inside the main body or the error on the board does not occur.	-	NO	Remove the plug from the outlet, check the cause of the error, and repair it.
10	The voltage of CN51-1 and CN51-2 of PBDB1 is DC24V.	PB: 25-J	NO	Repair the wiring from DCPU /1 to PBDB1. Replace DCPU/1
11	The voltage of CN51-1 to CN52-3 of PBDB1 is DC24V.	PB:24-J	NO	Repair the wiring from DCPU /2 to PBDB1. Replace DCPU 2
12	The voltage of CN50-1 and CN50-2 of PBDB1 is DC5V.	PB:26-J	YES	Replace PBDB1
			NO	Repair the wiring from DCPU /3 to PBDB1. Replace DCPU/3

3.4.9 GP-501

Target parts for trouble				
Line filter (GP) Power supply (GP)		Punch controller PCB (GP)		
Step	Check item	Wiring diagram location	Result	Action

1	The front door of GP is open.	GP: 5-F	YES	Close the front door.
2	The voltage between P39-4 and P39-5 of punch controller PCB is DC5V.	GP: 8-E	NO	Repair the wiring between the main body and GP.
3	Disconnect the plug of GP from the outlet. The voltage of the outlet is the power supply voltage. * Be sure not to overuse the power of the outlet including the other connected machines.	-	NO	Ask the administrator on the user side to check the state of the power of the outlet.
4	Wiring from the punch controller PCB to power supply is connected properly.	GP: 4-E	NO	Repair the wiring.
5	After checking that the plug of GP is not connected to the outlet, scale the resistance value on the both edge of the plug and it is 0.	GP: 3-E	YES	Check the cause of the short on the wiring from the plug to punch controller PCB.
6	Connect the plug of GP to the outlet and find that any irregular sound or the error on the board does not occur.	-	NO	Remove the plug from the outlet, check the cause of the error, and repair it.
7	The fuse of power supply has the conduction.	-	NO	Replace power supply.
8	The voltage of P14-1 and P14-3 of punch controller PCB is DC24V.	GP: 5-E	YES	Replace punch controller PCB.
			NO	Replace power supply.

4. IMAGE TROUBLE

4.1 Initial check point

4.1.1 Initial check items

- Judge whether the cause of the image trouble is from the scanner system, the printer system, or the controller system.
- For the troubles of stripe and band, conduct the test print with the half tone image to judge whether it is the scanner system or the printer system.
- For the other image troubles, judge it from the copy from the original glass and the print from PC.

Scanner system

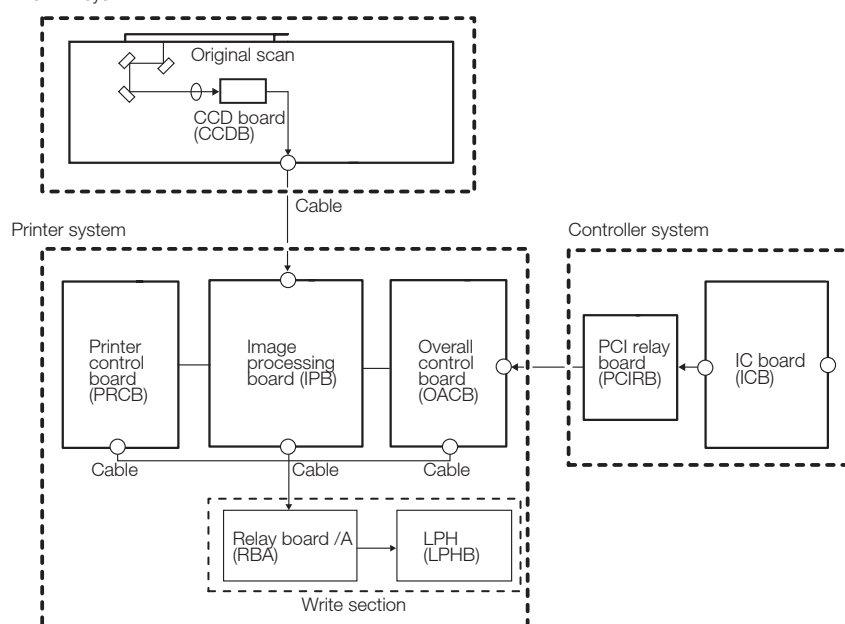

IMAGE TROUBLE	Action	Judgment	Cause	Next step
Stripe, band	Select [Service Mode] → [Test Mode] → [Test Pattern Output Mode] and enter "1" to print out the half tone with the density setting "60". Then the stripe or the band occurs.	YES	Printer system	Printer system procedure
		NO	Scanner system	Scanner system procedure
Others	The image trouble occurs only on the copy from the original glass.	YES	Scanner system	Scanner system procedure
	The same image trouble occurs on the copy from the original glass and the print from PC.	YES	Printer system	Printer system procedure
		NO	Controller system	Controller system procedure

4.2 Printer system procedure

4.2.1 OUTLINE

When it is judged as the printer system trouble from the initial check items, conduct the image stabilization after checking the printer check items.

Note

- The following sample images on each procedures are when printing in A3.

4.2.2 Check the printer

- Check the damage or the dirt on each section parts.

Procedure	Section	Check item	Result	Action
1	Paper	The paper setting of the machine and the paper to be printed are the same type.	NO	Check the paper type setting of the machine, and fix it.
2	Roller *1	There is dirt on rollers.	YES	Cleaning
3	Write section	The surface of LPH has dirt.	YES	Cleaning
4	Photo conductor section	Drum has dirt on its outward.	YES	Cleaning
5		Drum has the damage or the stripe on the upper side.	YES	Check the touching of the drum claw, Clean Replacing of the drum
6	Developing section	The developing bias contacting terminal surely touches.	NO	Clean the contacting terminal, Check the terminal position
7	Charging section	Charging wire or charging control plate has dirt.	YES	Cleaning

8	Transferring section	Transfer belt has dirt.	YES	Cleaning
9	Cleaning section	Cleaning blade surely touches to the drum.	NO	Check, clean, or replace the cleaning blade
10	Conveyance section, duplex section	Dirt or the foreign material is on the paper conveyance path.	YES	Cleaning
11	Fusing section	Fusing roller has dirt.	YES	Cleaning Check the cleaning web
12	Paper exit section	The paper exit roller and the de-curler roller have dirt.	YES	Cleaning

*1 The roller is likely to be dirty when printing on all-image area. When using thick paper, the roller is especially likely to be dirty by the toner which is adhered on the trimming side of the paper. When custom size paper is in use, it is printed on all-image area.

4.2.3 Image Stabilization

- Conduct the image stabilization to check whether the trouble is solved.

Procedure	Section	Check item	Result	Action
1	Service mode →Process adjustment→Drum Peculiarity Adjustment→Automatic Drum Potential	Conduct the auto charging potential adjustment and the problem is solved.	NO	Go on to the next step.
2	Service mode →Process adjustment→Drum Peculiarity Adjustment→Auto Maximum Density Adj.	Conduct the auto maximum density adjustment and the problem is solved.	NO	Go on to the next step.
3	Service mode →Process adjustment→Drum Peculiarity Adjustment→Auto Dot Diameter Adj.	Conduct the auto dot diameter adjustment and the problem is solved.	NO	Go on to the next step.
4	Service mode →Process adjustment→Drum Peculiarity Adjustment→Cartridge set mode	Conduct the cartridge set mode and the problem is solved.	NO	Go on to the next step.

4.2.4 Printer system: White lines in sub scan direction, White bands in sub scan direction, Black lines in sub scan direction, Black bands in sub scan direction

(1) Typical faulty images

White lines in sub scan direction

White bands in sub scan direction

Black lines in sub scan direction

Black bands in sub scan direction

(2) Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	Paper	It occurs on the particular paper.	YES	Check the setting of the paper type.
2	User mode →MACHINE	"Charge Manual Cleaning" solves the trouble.	YES	Conduct "Charge Manual Cleaning".

	→Adjustment →Charge Manual Cleaning			
3	Write section	The dirt adheres to the surface of LPH.	YES	Clean LPH
4	Charging section	Charger wire and charger control plate have foreign objects.	YES	Cleaning Replace the charger wire.
5	Cleaning section	Some parts on the cleaning blade are left to wipe.	YES	Cleaning Replace the cleaning blade
6	Photo conductor section	Drum separation claws have dirt.	YES	Cleaning Check the drum separation claws action
7	Fusing section	Fusing separation claws have dirt.	YES	Cleaning Check the fusing separation claws action
8	Check the printer	Check the transferring section, the developing section and the conveyance section.	NO	Clean, Replace
9	Connector, wiring	There is no problem on the image processing board, the overall control board, the write section, and the connector/wiring of the printer control board.	NO	Reconnect the connector Replace the wiring
10	Image Stabilization	The image stabilization solves the trouble.	NO	Go on to the next step.
11	Service mode → Machine Adjustment → LPH Adjustment	Conduct the gap adjustment between LPH chips, conduct the black lines adjustment, and the problem is solved.	NO	Go on to the next step.
12		The problem has been eliminated through the checks of steps up to 11.	NO	Replace LPH → Check or replace the charging section → Replacing of the drum → Check or replace the transferring section → Check or replace the developing section → Replace the image processing board

4.2.5 Printer system: White lines in main scan direction, White bands in main scan direction, Black lines in main scan direction, Black bands in main scan direction

(1) Typical faulty images

White lines in main scan direction

White bands in main scan direction

Black lines in main scan direction

Black bands in main scan direction

(2) Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	Paper	It occurs on the particular paper.	YES	Check the setting of the paper type, and fix it.
2	Check the printer	Check mainly on the charging section, transferring section, photo conductor section, developing section, and fusing section.	NO	Clean, Replace
3	Connector, wiring	There is no problem on the image processing board, the overall control board, the write section, and the connector/wiring of the printer control board.	NO	Reconnect the connector Replace the wiring
4	Image Stabilization	The image stabilization solves the trouble.	NO	Go on to the next step.

5		The problem has been eliminated through the checks of steps up to 4.	NO	Replacing of the drum → Check or replace the charging section → Check or replace the transferring section → Check or replace the developing section → Replace the image processing board
---	--	--	----	--

4.2.6 Printer system: Uneven density in sub scan direction

(1) Typical faulty images

(2) Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	Paper	It occurs on the particular paper.	YES	Check the setting of the paper type, and fix it.
2	Setting menu → Function setting → Density setting → Image density selection	Change the setting value of the image density to the plus, and the trouble is solved.	NO	Go on to the next step.
3	Check the printer	Check mainly on the charging section, transferring section, photo conductor section, and the developing section.	NO	Clean, Replace
4	Connector, wiring	There is no problem on the image processing board, the overall control board, the write section, and the connector/wiring of the printer control board.	NO	Reconnect the connector Replace the wiring
5		The problem has been eliminated through the checks of steps up to 4.	NO	Replacing of the drum → Check or replace the charging section → Replace LPH → Check or replace the transferring section → Check or replace the developing section → Replace the image processing board → Replace the high voltage unit /2

4.2.7 Printer system: Uneven density in main scan direction

(1) Typical faulty images

(2) Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	Paper	It occurs on the particular paper.	YES	Check the setting of the paper type, and fix it.
2	Setting menu → Function setting	Change the setting value of the image density to the plus, and the trouble is solved.	NO	Go on to the next step.

	→ Density setting → Image density selection			
3	Check the printer	Check mainly on the charging section, transferring section, photo conductor section, and the developing section.	NO	Clean, Replace
4	Connector, wiring	There is no problem on the image processing board, the overall control board, the write section, and the connector/wiring of the printer control board.	NO	Reconnect the connector Replace the wiring
5	Image Stabilization	The image stabilization solves the trouble.	NO	Go on to the next step.
6	Tray setting → Change Set → Process adjustment → Transfer current offset adjustment	Conduct the transfer current offset adjustment and the problem is solved.	YES	Select the side and part which abnormal condition occurs, and lower the transfer current offset value every 5 steps.
7		The problem has been eliminated through the checks of steps up to 6.	NO	Check or replace the charging section → Replace the drum → Replace LPH → Check or replace the transferring section → Check or replace the developing section → Replace the image processing board → Replace the high voltage unit /1 → Replace the high voltage unit /2

4.2.8 Printer system: Light density (ID lowering)

(1) Typical faulty images

(2) Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	Paper	It occurs on the particular paper.	YES	Check the setting of the paper type, and fix it.
2	Setting menu → Function setting → Density setting → Image density selection	Change the setting value of the image density to the plus, and the trouble is solved.	NO	Go on to the next step.
3	IDC sensor	IDC sensor has dirt.	YES	Clean the IDC sensor with alcohol.
4	Toner supply section	The setting of toner bottle is appropriate.	NO	Reset
5		Toner is supplied to the intermediate hopper normally.	NO	Clean, Replace
6	Check the printer	Check mainly on the charging section, transferring section, photo conductor section, developing section, and toner supply section.	NO	Clean, Replace
7	Connector, wiring	There is no problem on the image processing board, the overall control board, the write section, and the connector/wiring of the printer control board.	NO	Reconnect the connector Replace the wiring
8	Image Stabilization	The image stabilization solves the trouble.	NO	Go on to the next step.
9	Individual support action adjustment → Image density adjustment	[Darker] on the image density adjustment solves the trouble.	NO	Go on to the next step.

10		The problem has been eliminated through the checks of steps up to 9.	NO	Check or replace the charging section → Replace the drum → Replace LPH → Check or replace the transferring section → Check or replace the developing section → Replace the image processing board → Replace the high voltage unit /1 → Replace the high voltage unit /2
----	--	--	----	--

4.2.9 Printer system: Gradation error

(1) Typical faulty images

(2) Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	Gradation pattern	Print out the test pattern No.3 or No.5 and the gradation pattern is without any trouble.	YES	Check the other density errors of the printer system.
2	Paper	It occurs on the particular paper.	YES	Check the setting of the paper type, and fix it.
3	Density	It occurs on the particular image (such as picture).	YES	Check Copy Setting → Image Setting (letters, light letters, picture).
4	Setting menu → Function setting → Density setting → Image density selection	The setting value adjustment of the image density solves the trouble. Too light: Change the setting value to the plus. Too dark: Change the setting value to the minus.	NO	Go on to the next step.
5	Check the printer	Check mainly on the charging section, transferring section, photo conductor section, and the developing section.	NO	Clean, Replace
6	Connector, wiring	There is no problem on the image processing board, the overall control board, the write section, and the connector/wiring of the printer control board.	NO	Reconnect the connector Replace the wiring
7	Image Stabilization	The image stabilization solves the trouble.	NO	Go on to the next step.
8		The problem has been eliminated through the checks of steps up to 7.	NO	Check or replace the charging section → Replace the drum → Check or replace the transferring section → Check or replace the developing section → Replace the image processing board → Replace the high voltage unit /2

4.2.10 Printer system: Half tone overall diagonal stripe**(1) Typical faulty images****(2) Troubleshooting procedure**

Procedure	Section	Check item	Result	Action
1	Paper	It occurs on the particular paper.	YES	Check the setting of the paper type.
2	Developer	The developer is new.	YES	Go on to step 3.
		The developer is old.	YES	Go on to step 4.
3	Setting menu → Administrator setting → System Setting → Expert adjustment → Scan quality adjustment → Texture Elimination	When the developer is new, check the setting data of [Texture Elimination], and it is "OFF".	YES	Change the setting data to "ON". Note Because the gradation peculiarity deteriorates with "ON" of [Texture Elimination], be sure to use "ON" only when the developer is new.
4	Check the printer	Check mainly on the charging section, transferring section, photo conductor section, and the developing section.	NO	Clean, Replace
5	Image Stabilization	The image stabilization solves the trouble.	NO	Go on to the next step.
6		The problem has been eliminated through the check of step 5.	NO	Replace developer → Check or replace the developing section

4.2.11 Printer system: Half tone repelling**(1) Typical faulty images****(2) Troubleshooting procedure**

Procedure	Section	Check item	Result	Action
1	Paper	It occurs on the particular paper.	YES	Check the setting of the paper type.
2	Transferring section	Transfer belt or the power feeding section of transfer roller has dirt.	YES	Remove dirt
3	Check the printer	Check mainly on the transferring section, the charging section, photo conductor section, and the developing section.	NO	Clean, Replace
4	Image Stabilization	The image stabilization solves the trouble.	NO	Go on to the next step.
5	Tray setting → Change Set → Process adjustment → Transfer current offset adjustment	Conduct the transfer current offset adjustment and the problem is solved.	YES	Select the side and part which abnormal condition occurs, and lower the transfer current offset value every 5 steps.

6		The problem has been eliminated through the check of step 5.	NO	Check or replace the transferring section → Replace the drum → Check or replace the charging section → Check or replace the developing section → Replace the high voltage unit /2 → Replace the image processing board
---	--	--	----	---

4.2.12 Printer system: Size memory

(1) Typical faulty images

(2) Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	Paper	It occurs on the particular paper.	YES	Check the setting of the paper type.
2	Paper usage	The trouble occurs after using small-size paper.	YES	Go on to step 3.
			NO	Go on to step 4.
3	User mode → Machine → Adjustment → Size memory recovery mode	Conduct the size memory recovery mode after using small-size paper.	YES	Conduct the size memory recovery mode.
4	Check the printer	Check mainly on the transfer section, photo conductor section, charging section, and PCC section.	NO	Clean, Replace
5	Image Stabilization	The image stabilization solves the trouble.	NO	Go on to the next step.
6		The problem has been eliminated through the check of step 5.	NO	Replace the fusing roller → Replace fusing heater lamp

4.2.13 Printer system: Short diagonal lines, wrinkling of paper

(1) Typical faulty images

(2) Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	Paper	It occurs on the particular paper.	YES	Check the setting of the paper type.
2	Paper usage	The trouble occurs after using small-size paper.	YES	Go on to step 3.
			NO	Go on to step 4.
3	Service mode → System Setting → Software DIPSW DIPSW_8-7	Setting is "1".	NO	Change the setting value of software DIPSW_8-7 to "1" (with initial rotation).
4	Check the printer	Check mainly on the fusing section.	NO	Clean, Replace

5	Image Stabilization	The image stabilization solves the trouble.	NO	Go on to the next step.
6		The problem has been eliminated through the check of step 5.	NO	Replace the fusing roller → Replace fusing heater lamp

4.2.14 Printer system: Wax unevenness

(1) Typical faulty images

Trails with exit rollers

(2) Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	Paper	It occurs on the particular paper.	YES	Check the setting of the paper type.
2	Output job	Output the job (light density) other than the job which occurs the trouble in first.	YES	Go on to the next step.
3	Fusing section	Check dirt of the paper exit roller.	YES	Remove dirt
4	Check the printer	Check mainly on the fusing section.	NO	Clean, Replace
5	Image Stabilization	The image stabilization solves the trouble.	NO	Go on to the next step.
6	Service mode → System Setting → Software DIPSW DIPSW_19-0 to 19-3	The wax unevenness is solved by lowering the fusing temperature.	YES	Change the setting of software DIPSW_19-0 to 19-3 to lower the fusing temperature.
7		The problem has been eliminated through the check of step 6.	NO	Check or replace the paper exit roller → Check or replace the fusing roller → Replace the fusing temperature sensor → Replace fusing heater lamp → Replace the overall control board

4.2.15 Printer system: Gray background

(1) Typical faulty images

(2) Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	Paper	It occurs on the particular paper.	YES	Check the setting of the paper type.
2	Service mode → Process adjustment → Drum Peculiarity Adjustment	Conduct the cartridge set mode and the trouble is solved.	NO	Go on to the next step.

	→ Cartridge set mode			
3	Setting menu → Function setting → Density setting → Image density selection	Change the setting value of the image density to the minus, and the trouble is solved.	YES	Change the setting value to the minus.
4	Check the printer	Check mainly on the charging section, transferring section, photo conductor section, developing section, and write section.	NO	Clean, Replace
5	Connector, wiring	There is no problem on the image processing board, the overall control board, the write section, and the connector/wiring of the printer control board.	NO	Reconnect the connector Replace the wiring
6	Image Stabilization	The image stabilization solves the trouble.	NO	Go on to the next step.
7	Service mode → System Setting → Software DIPSW5-5/6/7	Changing the developer toner density lighter solves the trouble.	YES	Change the settings of software DIPSW_5-5/6/7 to lighten the developer toner density.
8		The problem has been eliminated through the checks of steps up to 7.	NO	Check or replace the charging section → Replace the drum → Check or replace the transferring section → Check or replace the developing section → Replace LPH → Replace the image processing board → Replace the high voltage unit /1 → Replace the high voltage unit /2

4.2.16 Printer system: Density decrease of solid black

(1) Typical faulty images

(2) Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	Paper	It occurs on the particular paper.	YES	Check the setting of the paper type.
2	Transferring section	Check dirt on the transfer belt and power feeding section of the transfer roller.	YES	Remove dirt
3	Image Stabilization	The image stabilization solves the trouble.	NO	Go on to the next step.
4	Tray setting → Change Set → Process adjustment → Transfer current offset adjustment	Check the offset value of the transfer current offset adjustment.	NO	Select the side and part which abnormal condition occurs, and raise the transfer current offset value every 5 steps.
5	Check the printer	Check mainly on the transferring section, the charging section, photo conductor section, and the developing section.	NO	Clean, Replace

6		The problem has been eliminated through the check of step 5.	NO	Check or replace the transferring section → Replace the drum → Check or replace the charging section → Check or replace the developing section → Replace the image processing board → Replace the high voltage unit /2
---	--	--	----	---

4.2.17 Printer system: Void areas, White spots

(1) Typical faulty images

(2) Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	Paper	It occurs on the particular paper.	YES	Check the setting of the paper type.
2	Developing section	Developing section has the foreign object or the solid toner in it.	YES	Remove foreign object Replace developer
3	Check the printer	Check mainly on the charging section, transferring section, photo conductor section, developing section, and fusing section.	NO	Clean, Replace
4	Connector, wiring	There is no problem on the image processing board, the overall control board, the write section, and the connector/wiring of the printer control board.	NO	Reconnect the connector Replace the wiring
5	Image Stabilization	The image stabilization solves the trouble.	NO	Go on to the next step.
6		The problem has been eliminated through the checks of steps up to 5.	NO	Check or replace the charging section → Replace the drum → Check or replace the transferring section → Check or replace the developing section → Replace LPH → Replace the image processing board → Replace the high voltage unit /1 → Replace the high voltage unit /2

4.2.18 Printer system: Black spots

(1) Typical faulty images

(2) Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	Paper	It occurs on the particular paper.	YES	Check the setting of the paper type.
2	Photo conductor section	Conduct the cartridge set mode and the trouble is solved.	NO	Go on to the next step.
3	Check the printer	Check mainly on the charging section, transferring section, photo conductor section, developing section, conveyance section, and fusing section.	NO	Clean, Replace
4	Connector, wiring	There is no problem on the image processing board, the overall control board, the write section, and the connector/wiring of the printer control board.	NO	Reconnect the connector Replace the wiring
5	Image Stabilization	The image stabilization solves the trouble.	NO	Go on to the next step.
6	Service mode → Process adjustment Drum Peculiarity Manual	The value of [Maximum density adj.] is smaller than 250.	YES	Go on to step 7.
			NO	Go on to step 8.
7		The problem has been eliminated through the checks of steps up to 6.	NO	Check or replace the charging section → Replace the drum → Check or replace the transferring section → Check or replace the developing section → Replace LPH

4.2.19 Printer system: Image blurring**(1) Typical faulty images****(2) Troubleshooting procedure**

Procedure	Section	Check item	Result	Action
1	Paper	It occurs on the particular paper.	YES	Check the setting of the paper type, and fix it.
2	Check the printer	Check mainly on the charging section, transferring section, photo conductor section, developing section, and write section.	NO	Clean, Replace
3	Connector, wiring	There is no problem on the image processing board, the overall control board, the write section, and the connector/wiring of the printer control board.	NO	Reconnect the connector Replace the wiring
4	Image Stabilization	The image stabilization solves the trouble.	NO	Go on to the next step.
5	Write section	The LPH is installed at proper position (inserted fully).	NO	Installation
6		The problem has been eliminated through the checks of steps up to 5.	NO	Check or replace the charging section → Replace the drum → Check or replace the transferring section → Check or replace the developing section → Replace LPH → Replace the image processing board

4.2.20 Printer system: Poor fusing performance, Offset**(1) Typical faulty images**

Poor fusing performance

Offset

**(2) Troubleshooting procedure**

Procedure	Section	Check item	Result	Action
1	Paper	It occurs on the particular paper.	YES	Check the setting of the paper type, and fix it.
2	Cleaning section (Offset)	Some parts on the cleaning blade are left to wipe.	YES	Cleaning Replace the cleaning blade
3	Fusing section	The fusing temperature sensor is installed properly.	NO	Check the installation position.
4	Check the printer	Check mainly on the cleaning section and the fusing section.	NO	Clean, Replace
5	Connector, wiring	There is no problem on the connector of the printer control board, and the wiring.	NO	Reconnect the connector Replace the wiring
6	Image Stabilization	The image stabilization solves the trouble.	NO	Go on to the next step.
7	Service mode → System Setting → Software DIPSW DIPSW_19-0 to 19-3	Changing the fusing temperature eliminates the poor fusing performance and the offset.	YES	Conduct the fusing temperature setting
8		The problem has been eliminated through the checks of steps up to 7.	NO	Fusing temperature sensor → Replace fusing heater lamp → Replace the printer control board

4.2.21 Printer system: Brush effect, Image bleeding**(1) Typical faulty images**

Brush effect

Blurred image

**(2) Troubleshooting procedure**

Procedure	Section	Check item	Result	Action
1	Paper	Paper is moisturized.	YES	Replace to the paper that has just opened.
2		It occurs on the particular paper.	YES	Check the setting of the paper type, and fix it.
3	Fusing section	Clean the cleaning web properly.	NO	Check the cleaning web Replace the cleaning web
4	Check the printer	Check mainly on the transferring section, fusing section, and conveyance section.	NO	Clean, Replace

5	Connector, wiring	There is no problem on the connector of the printer control board, and the wiring.	NO	Reconnect the connector Replace the wiring
6	Image Stabilization	The image stabilization solves the trouble.	NO	Go on to the next step.
7		The problem has been eliminated through the checks of steps up to 6.	NO	Fusing temperature sensor → Replace fusing heater lamp → Replace the printer control board

4.2.22 Printer system: Inky backside

(1) Typical faulty images

(2) Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	Paper path	There are foreign objects or dirt on the paper path.	YES	Remove the foreign object or dirt
2	Transferring section	Check dirt on the transferring belt and check the transferring belt cleaning section.	YES	Clean, Replace
3	Fusing section	Fusing guide plate has dirt.	YES	Remove dirt
4		Fusing roller /Lw has the damage or dirt.	YES	Cleaning or replacing the fusing roller /Lw
5	Paper exit section	Exit roller had dirt.	YES	Remove dirt
6	Check the printer	Check mainly on the transferring section, conveyance section, and the fusing section.	NO	Clean, Replace
7	Connector, wiring	There is no problem on the connector of the printer control board, and the wiring.	NO	Reconnect the connector Replace the wiring
8	Image Stabilization	The image stabilization solves the trouble.	NO	Go on to the next step.
9		The problem has been eliminated through the checks of steps up to 8.	NO	Check or replace the transferring section Check or replace the fusing section Check or replace the paper exit section → Replace the image processing board

4.2.23 Printer system: Leading edge face dirt in paper feed direction

(1) Typical faulty images

(2) Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	Paper	It occurs on the particular paper.	YES	Check the setting of the paper type.

				Change the paper storage direction in the tray when paper is curled or burred.
2	Occurrence location Fusing guide plate	Dirt appears on 2 parts, at the center and 108mm shifted to both sides.	YES	Go on to step 8.
			NO	Go on to step 3.
3	Occurrence location Drum Separation claws	Dirt appears on 3 parts, at the center and 85mm shifted to both sides.	YES	Go on to step 7.
			NO	Go on to step 4.
4	Occurrence location Fusing claws	Dirt appears on 6 parts, at the center and 40mm, 81mm or 119mm shifted to both sides.	YES	Go on to step 5.
			NO	Go on to step 9.
5	Leading edge blank space	Set the leading edge blank space 3mm or more, and the trouble is solved.	YES	Set the leading edge blank space 3mm or more.
6	Fusing section	Check dirt on the fusing separation claws.	YES	Remove dirt
7	Tray setting → Change Set → Process adjustment → Transfer current offset adjustment	Check the offset value of the leading edge1 by the transfer current offset adjustment.	NO	1. Raise the leading edge1 offset value of the side which abnormal condition occurs every 5 steps. 2. When the problem is not solved, lower the leading edge1 offset value every 5 steps.
8	Fusing section	Check dirt on the fusing guide plate.	YES	Remove dirt
9	Paper path	Check foreign objects and dirt on the paper path.	YES	Remove the foreign object or dirt
10	Check the printer	Check mainly on the transferring section, conveyance section, and the fusing section.	NO	Clean, Replace
11		The problem has been eliminated through the checks of steps up to 10.	NO	Check or replace the separation claws → Replace the printer control board → Replace the high voltage unit /2

4.2.24 Printer system: Transfer jitter

(1) Typical faulty images

(2) Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	Paper	It occurs on the particular paper.	YES	Check the setting of the paper type.
2	Occurrence interval	It occurs at the position 124mm from the leading edge. It occurs at the position 120mm from the trail edge. It occurs at the position 160mm from the trail edge. It occurs at the position 265mm from the trail edge. It randomly occurs at the position 150mm from the leading edge on the 2nd sheet.	YES	Go on to step 3.
		It occurs at intervals other than above mentioned.	YES	Go on to step 5.
3	Service mode → Machine adjustment → Magnification adjustment	Confirm that according to the transfer jitter adjustment. (Refer to 1. 8.2.10 Transfer jitter adjustment)	YES	Conduct one of "Fusing Speed Adjustment", "Registration Line Speed Adjustment" or "Transfer Belt Speed Adjustment".
4	Check the printer	Check mainly on the charging section, transferring section, photo conductor section, developing section, write section, and fusing section.	NO	Clean, Replace

5		The problem has been eliminated through the checks of steps up to 4.	NO	Check or replace the charging section → Check or replace the transferring section → Check or replace the developing section → Replace LPH
---	--	--	----	--

4.2.25 Printer system: Blank print, Black print

(1) Typical faulty images

Blank print

Black print

(2) Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	Image check	Blank copy occurs.	YES	Check the connection of the connector in the write section.
2	Check the printer	Check mainly on the charging section, transferring section, photo conductor section, developing section, and write section.	NO	Clean, Replace
3	Connector, wiring	There is no problem on the image processing board, the overall control board, the write section, and the connector/wiring of the printer control board.	NO	Reconnect the connector Replace the wiring
4	Image Stabilization	The image stabilization solves the trouble.	NO	Go on to the next step.
5		The problem has been eliminated through the check of step 4.	NO	Check or replace the charging section → Replace the drum → Check or replace the transferring section → Check or replace the developing section → Replace LPH → Replace the image processing board → Replace the high voltage unit /1 → Replace the high voltage unit /2

4.3 Scanner system procedure

4.3.1 OUTLINE

When it is judged as the trouble of the scanner system from the initial check items, check the scanner check items.

Note

- The following sample images on each procedures are when printing in A3.

4.3.2 Scanner check items

- Check the damage on the parts of the scanner system.

Procedure	Section	Check item	Result	Action
1	Original	Original has the damage or dirt.	YES	Original change
2	ADF	Original guide cover has dirt.	YES	Cleaning
3	Original glass	Original glass has dirt.	YES	Clean with the soft cloth.
4	Slit glass	Slit scan glass for reading DF has dirt.	YES	Clean with the soft cloth.
5	Shading correction plate	Shading correction plate has dirt.	YES	Clean with the soft cloth.

6	Mirror/Lens/ Exposure lamp/ Reflective mirror	Mirror has dirt.	YES	Cleaning
		Lens has dirt.	YES	Cleaning
		Exposure lamp has dirt.	YES	Cleaning
		Reflective mirror has dirt.	YES	Cleaning

4.3.3 Scanner system: White lines in sub scan direction, White bands in sub scan direction, Black lines in sub scan direction, Black bands in sub scan direction

(1) Typical faulty images

White lines in sub scan direction

White bands in sub scan direction

Black lines in sub scan direction

Black bands in sub scan direction

(2) Troubleshooting procedure

1. When using original glass

Procedure	Section	Check item	Result	Action
1	Scanner check	There is no problem on scanner check items.	NO	Clean, Replace
2	Service mode → Machine adjustment → Centering adjustment	The adjustment value of [Scanner Centering Adjustment] is within the standard.	NO	Conduct the scanner Centering Adjustment.
3		The problem has been eliminated through the checks of steps up to 2.	NO	Replace exposure unit → Replace CCD unit

2. When the DF is in use

Procedure	Section	Check item	Result	Action
1	Scanner check	There is no problem on scanner check items.	NO	Clean, Replace
2	Service mode → Machine adjustment → Centering adjustment	The adjustment value of [ADF Centering Adjustment] is within the standard.	NO	Conduct ADF Centering Adjustment.
3	Service mode → Machine adjustment → ADF Adjustment	The adjustment value of [ADF Skew Offset Adj.] is within the standard.	NO	Conduct ADF skew offset adjustment.
4	MECHANICAL ADJUSTMENT → DF → Paper skew adjustment	Adjustment position is proper.	NO	Conduct the paper skew adjustment.
5		The problem has been eliminated through the checks of steps up to 4.	NO	Replace exposure unit → Replace CCD unit

4.3.4 Scanner system: White lines in main scan direction, White bands in main scan direction, Black lines in main scan direction, Black bands in main scan direction

(1) Typical faulty images

White lines in main scan direction

White bands in main scan direction

Black lines in main scan direction

Black bands in main scan direction

(2) Troubleshooting procedure

1. When using original glass

Procedure	Section	Check item	Result	Action
1	Scanner check	There is no problem on scanner check items.	NO	Clean, Replace
2	Service mode → Machine adjustment → Timing adjustment	The adjustment value of [Scanner Restart Timing Adjustment] is within the standard.	NO	Conduct the scanner restart timing adjustment.
3	Service mode → Machine adjustment → Centering adjustment	The adjustment value of [Scanner Centering Adjustment] is within the standard.	NO	Conduct the scanner Centering Adjustment.
4		The problem has been eliminated through the checks of steps up to 3.	NO	Replace exposure unit → Replace CCD unit

2. When the DF is in use

Procedure	Section	Check item	Result	Action
1	Scanner check	There is no problem on scanner check items.	NO	Clean, Replace
2	Service mode → Machine adjustment → Timing adjustment	The adjustment value of [ADF Restart Timing Adjustment] is within the standard.	NO	Conduct ADF restart timing adjustment.
3	Service mode → Machine adjustment → Centering adjustment	The adjustment value of [ADF Centering Adjustment] is within the standard.	NO	Conduct ADF Centering Adjustment.
4	Service mode → Machine adjustment → ADF Adjustment	The adjustment value of [ADF Skew Offset Adj.] is within the standard.	NO	Conduct ADF skew offset adjustment.
5	MECHANICAL ADJUSTMENT → DF → Paper skew adjustment	Adjustment position is proper.	NO	Conduct the paper skew adjustment.
6		The problem has been eliminated through the checks of steps up to 5.	NO	Replace exposure unit → Replace CCD unit

4.3.5 Scanner system: Black spots**(1) Typical faulty images****(2) Troubleshooting procedure**

Procedure	Section	Check item	Result	Action
1	Scanner check	There is no problem on scanner check items.	NO	Clean, Replace
2		The problem has been eliminated through the check of step 1.	NO	Replace exposure unit → Replace CCD unit

4.3.6 Scanner system: Gray background**(1) Typical faulty images****(2) Troubleshooting procedure**

Procedure	Section	Check item	Result	Action
1	Scanner check	There is no problem on scanner check items.	NO	Clean, Replace
2	DF unit	DF unit changes the shape or the hinge is damaged.	YES	Replace DF unit
3	MECHANICAL ADJUSTMENT → DF → Height adjustment	DF unit is not at proper position.	YES	Conduct DF height adjustment.
4		The problem has been eliminated through the checks of steps up to 3.	NO	Replace exposure unit → Replace CCD unit

4.3.7 Scanner system: Blurred image, Brush effect**(1) Typical faulty images****(2) Troubleshooting procedure**

Procedure	Section	Check item	Result	Action
1	Original	Original has bumps.	YES	Original change
2	DF unit	DF unit changes the shape or the hinge is damaged.	YES	Replace DF unit
3	MECHANICAL ADJUSTMENT → DF → Height adjustment	DF unit is not at proper position.	YES	Conduct DF height adjustment.

4	Scanner check	There is no problem on scanner check items.	NO	Clean, Replace
5	Scanner section	Original glass leans or is not at proper position.	YES	Install it at proper position.
6		The install positions of V-mirror unit and the exposure unit are proper.	NO	Conduct the readjustment with using the optics unit positioning jig.
7		The problem has been eliminated through the checks of steps up to 6.	NO	Replace exposure unit → Replace CCD unit

4.3.8 Scanner system: Moire

(1) Typical faulty images

(2) Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	Original	Moire does not occur after changing the direction of original set.	YES	Original set direction change
2	Basic setting → Quality Adj.	Moire does not occur after changing the quality of the original.	YES	Change to the other types of original (Text, Text/Photo, Photo).
3	Basic screen → Zoom	Changing the magnification solves moire.	YES	Change the magnification.
4	Setting menu → Administrator setting → System Setting → Expert adjustment → Scan quality adjustment → Texture Elimination	Check the setting value of "Texture Elimination", and it is "OFF".	YES	Turn the setting value "ON". Note Because the gradation peculiarity deteriorates with "ON" of "Texture Elimination", be sure to use "ON" only when moire occurs.
5	Service mode → System Setting → Software DIPSW DIPSW_27-6	Change the dot complement in skew adjustment and the trouble is solved.	YES	Change the setting value to "0" (reduce moire in the dot section).
6		The problem has been eliminated through the checks of steps up to 5.	NO	Replace CCD unit

4.3.9 Scanner system: Leaning image

(1) Typical faulty images

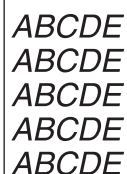

(2) Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	Original	Original is leaning.	YES	Setting original Replacing original
2	Scanner check	There is no problem on scanner check items.	NO	Clean, Replace
3	Scanner section	Original glass leans or is not at proper position.	YES	Install it at proper position.

4		The install positions of V-mirror unit and the exposure unit are proper.	NO	Conduct the readjustment with using the optics unit positioning jig.
5		The problem has been eliminated through the checks of steps up to 4.	NO	Replace exposure unit → Replace CCD unit

4.3.10 Scanner system: Image distortion

(1) Typical faulty images

(2) Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	State of the machine installed	The main body is installed on the horizontal place.	NO	Re-install
2	Scanner check	There is no problem on scanner check items.	NO	Clean, Replace
3	Service mode → Machine adjustment → Warp adjustment	Conduct the warp adjustment and the trouble is solved.	NO	Conduct the warp adjustment.
4	Scanner section	The install positions of V-mirror unit and the exposure unit are proper.	NO	Conduct the readjustment with using the optics unit positioning jig.
5		The problem has been eliminated through the checks of steps up to 4.	NO	Replace exposure unit → Replace CCD unit

4.3.11 Scanner system: Low image density, Rough image

(1) Typical faulty images

(2) Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	Scanner check	There is no problem on scanner check items.	NO	Clean, Replace
2	Scanner section	Exposure lamp has dirt.	YES	Cleaning
3		The problem has been eliminated through the checks of steps up to 2.	NO	Replace exposure unit → Replace CCD unit

4.3.12 Scanner system: Blank copy, Black copy

(1) Typical faulty images

(2) Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	Gradation pattern	Print out the test pattern No.3 or No.5 and the gradation pattern is without any trouble.	NO	Check the image trouble of the printer system.
2	Scanner check	There is no problem on scanner check items.	NO	Clean, Replace
3	Connector, wiring	There is no trouble on CCD unit, connector of the overall control board, and wiring.	NO	Reconnect the connector Replace the wiring
4		The problem has been eliminated through the checks of steps up to 3.	NO	Replace CCD unit → Replace the overall control board

4.3.13 Scanner system: Uneven density

(1) Typical faulty images

(2) Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	Scanner check	There is no problem on scanner check items.	NO	Clean, Replace
2	Scanner section	V-mirror unit and the exposure unit moves smoothly.	NO	Check the scanner wire
3		The install positions of V-mirror unit and the exposure unit are proper.	NO	Conduct the readjustment with using the optics unit positioning jig.
4		The problem has been eliminated through the checks of steps up to 3.	NO	Replace exposure unit → Replace CCD unit

4.4 Controller system procedure

4.4.1 OUTLINE

When it is judged as the controller system trouble from the initial check items, check the controller check items.

Note

- The following sample images on each procedures are when printing in A3.

4.4.2 Controller check item

- Check the network connection of the controller system.

Procedure	Section	Check item	Result	Action
1	Network cable	Network cable is properly connected.	NO	Reconnect
2	Network connection	Green LED next to the LAN connector is ON.	NO	Ask the system administrator on the user side to check if the output of HUB has trouble.

				→ Without any trouble, go on to the next step
3	Network Setting	Network setting of the administrator setting is set properly.	NO	Ask the system administrator on the user side to set.

4.4.3 Controller system: Blank print, Black print

(1) Typical faulty images

Blank print

Black print

(2) Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	Controller check	There is no problem on the controller check item.	NO	Recover the network connection
2	IC board (ICB)	Connector of IC board is surely set.	NO	Reconnect the connector
3	PCI relay board (PCIRB)	Connector on the PCI relay board is surely set.	NO	Reconnect the connector
4	Overall control board (OACB)	Connector of overall control board is surely set.	NO	Reconnect the connector
5		The problem has been eliminated through the checks of steps up to 4.	NO	Replace the IC board. → Replace the PH relay board. → Replace the overall control board.

5. CONTROLLER TROUBLE

5.1 Even if the power of the main body is turned ON, [Data can be received.] is not displayed on the operation panel.

5.1.1 Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	IC Unit	IC unit is connected securely to the main body.	NO	Check the connection of IC unit and then connect it again.
2	IC Unit	Each connector in the IC board is connected securely.	NO	Connect the connector again.
		The problem has been eliminated through the checks of steps up to 2.	NO	Replace the IC board.

5.2 The print jobs on the PC side are completed, but no printing starts.

5.2.1 Troubleshooting procedure

Procedure	Section	Check item	Result	Action
1	Main body	Sub power switch of main body is ON.	NO	Turn ON the sub power switch and check it again.
2	Main body	Network cable or USB cable is disconnected from the main body.	YES	Connect the cable to the main body and then check it again.
3	Main body	An error occurs on the main body side.	YES	Check the operation panel of the main body and check it again after returning it to the normal condition.
4	Main body	Jobs are placed in a wait condition.	YES	Check the operation panel of the main body and then check the sequence of jobs.
5	PC	Printing is indicated as [Save in the box] or [Secure Print].	YES	Setting it to [Print] and make printing again.
6	Main body/PC	When an authentication setting is made, user name (account name)/password that has not been registered is entered.	YES	Enter a correct user name (account name)/password and then conduct printing again.
7	Main body/PC	[Enhanced Security mode] is set on the main body.	YES	After consulting with the administrator of the main body, make an authentication setting.
		The problem has been eliminated through the checks of steps up to 7.	NO	Replace the IC board.

6. TROUBLESHOOTING (GP-501)

6.1 TROUBLESHOOTING (GP-501)

Also called Repair Analysis Procedures, this section contains the basic troubleshooting information that a technician needs to isolate the root cause of a specific symptom.

6.2 Troubleshooting

6.2.1 Troubleshooting

The tables that follow are arranged in order of the normal operational sequence.

6.2.2 General

One of the first rules of troubleshooting is to first understand the normal operating sequence of the machine (Refer to [PQ THEORY OF OPERATION GP-501](#)). Then carefully listen to the key operator's description of the problem or complaint. Follow this by your own visual observation. The cause of the problem can be determined by noting at which point in the operating cycle the problem occurred. To pinpoint the problem to a defective electrical component or mechanical part, use the Troubleshooting Guide and the OVERALL WIRING DIAGRAM. During any service call, it is a good practice to check the cable connections for fit and alignment.

Table 4.1 General Troubleshooting

Symptom	Probable Cause	Corrective Action
No indication of power (None of the three green LED's on Punch controller PCB or illuminated)	Not plugged in	Ensure that power cord is properly connected to the machine as well as the supply voltage.
	Power from outlet not correct	Check the power supplied from the outlet.
No indication of power, unit is plugged in.	Punch controller PCB, a minimum of 2 of the 3 LEDs on this board should be lit, if not, PCB is bad.	Replace Punch controller PCB.
	Display panel or cable.	Inspect or replace.
	Door not making interlocks.	Inspect or replace.
	Die Set not making switch.	Inspect or replace.
	Communication cables between GP- 501 and Printer	Check communication cables between printer and GP-501
Indication of power, yet GP-501 does not function (One or two LED's on the Punch controller PCB are illuminated, yet all three not illuminated.	5V from printer is not received at GP- 501	Connect all required communication cables from GP-501 to upstream device. The check to see if all LED's are illuminated.
	Door is not closed	Close door, then check to see if all LED's are illuminated. If door is closed, make sure door switch is being actuated.
	24V power supply is not functioning or not connected	Check to make certain AC is applied to power supply. Also check to make sure 24V is outputted from power supply.
	AC is not connected correctly	See above.
Machine will not start, GP-501 is shown on printer interface screen	Check Power supply board LED, if not lit, board is bad.	Inspect cable connections, replace Power supply board as needed.
	Check Punch controller PCB LEDs, if a minimum of two of the three are not lit, board is bad.	Inspect cable connections, replace Punch controller PCB as needed.
	Door is not closed or properly making the interlock.	Inspect and correct.
GP-501 does not appear on printer interface screen	LED's not illuminated on GP-501 Punch controller PCB.	See above.
	Communication cables between printer and upstream device not connected or faulty	Connect all required communication cables from GP-501 to upstream device.
	Firmware version not correct	Upgrade to the latest firmware for both the printer and GP-501
Paper misfeed is shown on printer interface screen, customer or operator has been unable to locate the misfeed.	Small piece of paper has become torn and is blocking sensor in paper path.	Check each sensor to make certain that they are not blocked.
Paper misfeed, not able to find any large sheets, removed sheets are torn.	Suspect a small piece of paper is hidden somewhere in the paper path.	Run a heavy cover stock through the system by hand. This process may drive any small torn pieces out of the paper path.
Punch does not cycle.	Punch clutch out of adjustment or defective.	Adjust or replace.
	Punch controller PCB.	
	Punch motor.	
Paper misfeed and/or punch shaft does not return to the home position.	Punch brake is not performing properly.	Adjust or replace.
Paper misfeed and/or punch continues to cycle.	Punch Flag sensor (S9) is broken or misaligned.	Adjust or replace.
Paper will not enter the punch area, runs through bypass only.	Divert solenoid malfunction.	Adjust or replace.

Paper is punched in the middle of the sheet.	Back Gauge solenoid is malfunctioning.	Adjust or replace.
Punch paper path is not operable, system will only bypass.	Transport motor not functioning.	Adjust or replace.
	Main control board not functioning properly.	Check connections, replace.
	Exit stepper motor or Entrance stepper motor is not functioning correctly.	Adjust or replace.
	Exit stepper motor or Entrance stepper motor controller boards are not functioning correctly.	Check connections, replace.
Punched holes are not centered.	Die Set positioning bracket is out of adjustment.	Inspect and adjust as required, see adjustment procedure.
Punched holes are not parallel to the edge of the paper.	Back Gauge is not functioning properly.	Inspect and adjust as required, see adjustment procedure.

6.2.3 Back Gauge

Table 4.2 Back Gauge Troubleshooting

Symptom	Probable Cause	Corrective Action
Deep punch or angled deep punch from leading edge of the paper.	Broken weld on paper stop, Back Gauge paddle.	Replace the unit. (Refer to F.21.3.30 Solenoid Spring Replacement)
	Broken or missing Back Gauge linkage springs.	Replace the springs. (Refer to F.21.3.30 Solenoid Spring Replacement)
Cannot remove the Die Set.	Back Gauge paddle is not in the fully opened position and is contacting the Die Set.	Turn the Punch Cycle Knob to ensure the punch drive indicator is lined up with the position indicator.
	Broken weld on paper stop, Back Gauge paddle.	Replace the unit. (Refer to F.21.3.30 Solenoid Spring Replacement)
	Broken or missing linkage spring or springs.	Replace the spring. (Refer to F.21.3.30 Solenoid Spring Replacement)
	Solenoid plunger stuck.	Clean the solenoid. (Refer to F.21.3.12 Cleaning and Checking the Back Gauge Solenoid)
	Solenoid plunger worn.	Replace Back Gauge. (Refer to F.21.3.28 Replacing the back gauge mechanism)
Punches occur 2 to 4" into the sheet.	One or more broken or missing linkage springs.	Replace springs. (Refer to F.21.3.30 Solenoid Spring Replacement)
	Back Gauge paddle is not fully closing, leaving a gap that the paper can slip through especially when using paper with heavy curl.	Adjust Back Gauge adjustment. (Refer to F.21.3.32 Back Gauge Assembly Adjustment)

6.2.4 Die Set

Under normal conditions, the GP-501 punch may experience one mis-feed in 5000. Excessive mis-feeding, such as one in every 1000, requires servicing. The cause may be the Die Set.

Symptom	Probable Cause	Corrective Action
Excessive mis-feeding. Paper does not exit after being punched.	Worn Die Set.	Replace Die Set if it is worn out, greater than 500K cycles.
	Defective Die Set.	Replace.
	Excessive oil on punch pins. Chad and paper dust sticks to the punch pin tip.	Clean pins to remove excess oil. Lubricate with approved lubricants only. (Refer to F.21.2.5 Checking and lubricating the Die Set pins and Die Set shoulder bolts)
	Floating pressure bar not retracting.	Replace pressure bar springs when applicable. (Refer to F.21.2.3.(5) Floating Pressure Bar Spring Replacement)

6.3 Initial Service Action

6.3.1 Initial Service Action

At the start of every service call, you should perform the following.

1. If called for a problem, determine the exact nature of the service complaint.
2. Estimate the cycle life on the Die Sets. Determine if any of the Die Set life cycles have exceeded 500k sheets (cycles).
3. Determine if the customer uses only one Die Set pattern (style) or if they switch between different patterns.
4. Determine the last time the Die Set was lubricated.
5. Determine the date of the last preventative maintenance performed on the punch system.
6. Determine the paper type and quality, especially as it relates to curl and identify if any media changes correlate with the emergence of the customer issue.

6.4 Mis-Feed Service Action

6.4.1 Mis-Feed Service Action

To clear a misfeed, first check the printer screen to see the area of the misfeed.

To clear a mis-feed in the punch:

1. Open the punch cabinet door.
2. Ensure the Chip Bin is not overflowing.
3. Turn punch knob [1] clockwise until the punch is in its home position [2].

Figure 4.3 Setting the Punch to Its Home Position.

4. Open the Bypass panel cover [1] and check for obstructions in the Bypass [2].
5. Ensure the Entrance Guide is clear [3].
6. Ensure the Diverter is clear [4].

Figure 4.4 Clearing The Bypass.

7. Open the entrance paper Aligner panel latch [1] and clear obstructions in the Aligner.
8. Open the exit paper Aligner panel latch [2] and clear obstructions in each Aligner.

Figure 4.5 Checking Paper Path Through the Punch.

9. Open the bottom U-channel by pressing the lever in [1] and lower the U-channel [2] and clear the path.

Figure 4.6 Opening the Bottom U-Channel

10. When all the paper is cleared, close the U-channel, Aligner Panels, and Bypass.
11. Shut the cabinet door.
12. Verify on the printer screen that the misfeed has been cleared. If not, repeat the above steps.
13. Press the Start button on the printer. The printing operation should resume.

6.5 Final Service Action

6.5.1 Final Service Action

This section explains the actions a technician should take at the end of every service call. With each step, verify that the system runs smoothly and misfeed free.

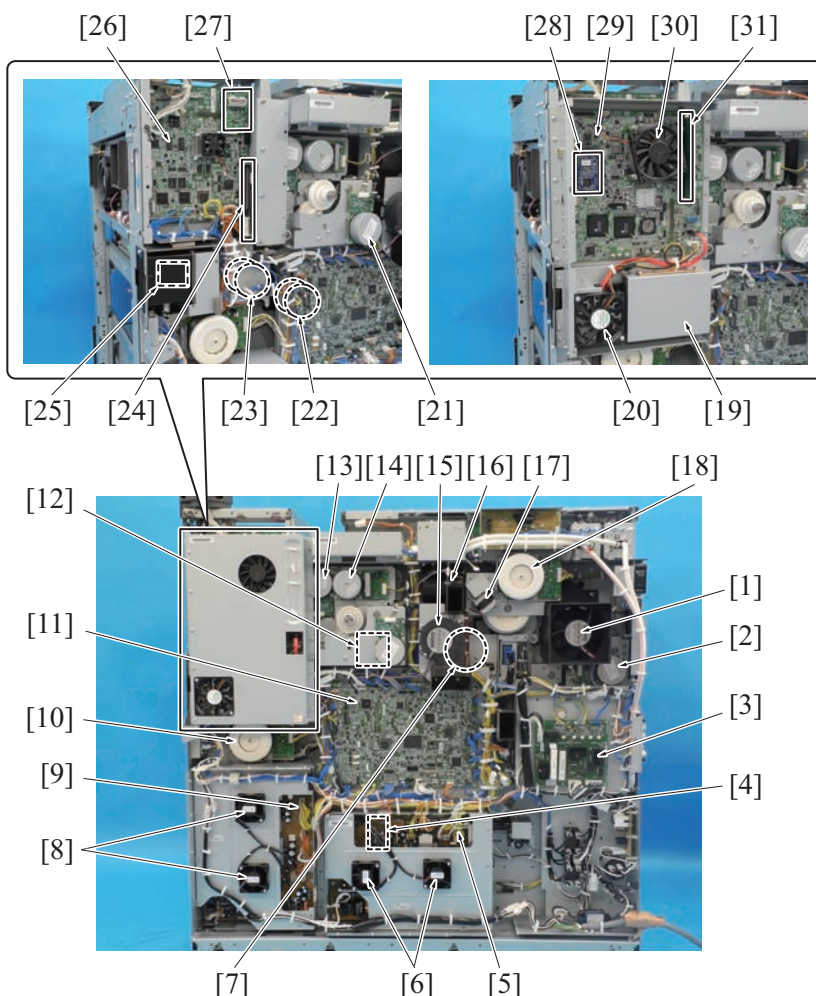

1. Inspect each Die Set visually and lubrication as needed. (Refer to [F.21.2.5 Checking and lubricating the Die Set pins and Die Set shoulder bolts](#))
2. Using the customer's primary Die Set pattern, run 200 simplex printed test sheets through the punch mode and examine the output for clean hole quality and even hole alignment.
3. Using the customer's primary Die Set pattern, run 200 duplex printed test sheets through the punch mode and examine the output for clean hole quality and even hole alignment.
4. Using any of the customer's secondary Die Set pattern, run 100 simplex printed test sheets through the punch mode and examine the output for clean hole quality and even hole alignment.
5. Run 100 sheets simplex and 100 sheets duplex through the punch bypass mode.
6. Clean out all paper chips (chad) and paper dust from the chip tray, the bottom of the machine and from the floor around the bottom of the machine. (Refer to [F.21.3.6 Cleaning the base](#))
7. Explain to the customer the service work that was performed and ensure they are satisfied before you close the call.

L PARTS/CONNECTOR LAYOUT DRAWING

1. PARTS LAYOUT DRAWING

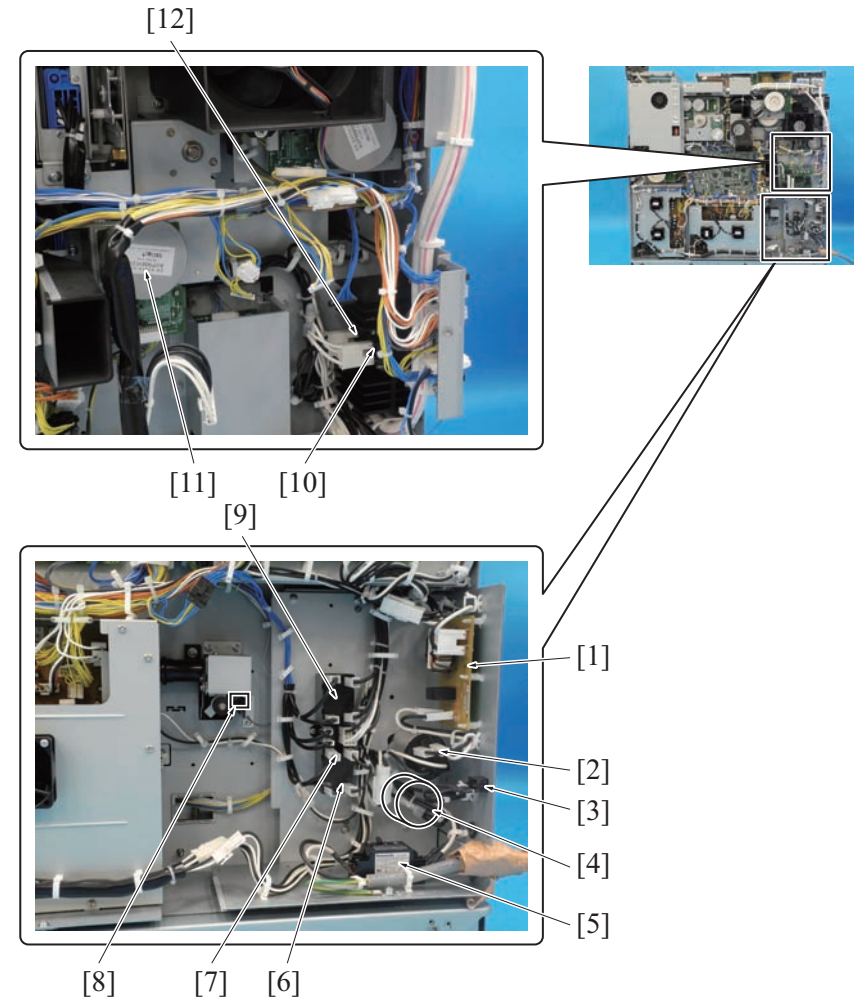

1.1 bizhub PRESS 1250/1250P/1052/PRO 951

1.1.1 Main body rear side 1

[1] Cooling fan /1 (FM1)	[2] Paper exit motor (M20)
[3] AC drive board (ACDB)	[4] Waste toner motor (M9)
[5] DC power supply /2 (DCPS2)	[6] DC power supply /2 cooling fan (FM42)
[7] Transfer belt cleaning motor (M5)	[8] DC power supply /1 cooling fan (FM41)
[9] DC power supply /1 (DCPS1)	[10] Paper feed motor (M4)
[11] Printer control board (PRCB)	[12] Drum motor (M2)
[13] Developing screw motor (M21)	[14] Developing motor (M3)
[15] Charger exhaust fan (FM44)	[16] Cooling fan /2 (FM2)
[17] Web motor (M24)	[18] Fusing motor (M1)
[19] Hard disk /2 (HDD2)	[20] IC exhaust fan (FM43)
[21] Drum cleaner motor (M35)	[22] Collection pipe cooling fan (FM34)
[23] Developing suction fan (FM22)	[24] PCI relay board (PCIRB)
[25] Vertical conveyance motor (M8)	[26] Overall control board (OACB)
[27] NVRAM board (NRB)	[28] SSD
[29] IC board (ICB)	[30] IC cooling fan (FM39)
[31] DIMM	-

1.1.2 Main body rear side 2

[1]	Noise filter /3 (NF3)	[2]	Noise filter /1 (NF1)
[3]	Dehumidification heater switch (SW3)	[4]	Noise filter /2 (NF2)*1
[5]	Circuit breaker (CBR)	[6]	Relay /1 (RL2)
[7]	Relay /2 (RL3)	[8]	Waste toner full sensor /2 (PS62)
[9]	Main relay (RL1)	[10]	Triac /1 (TRC1)
[11]	Paper exit conveyance motor (M31)	[12]	Triac /2 (TRC2)

*1 PRO 951 is unimplemented.

1.1.3 Main body rear side 3

[1]	Toner pump motor (M28)	[2]	Toner pump encoder sensor (PS28)
[3]	High voltage unit /3 (HV3)	[4]	Scanner drive board (SDB)
[5]	Scanner motor (M27)	[6]	High voltage unit /1 (HV1)
[7]	Air pump encoder sensor (PS29)	[8]	Air pump motor (M29)

1.1.4 Main body upper surface 1

[1]	Exposure lamp (L4)	[2]	Interlock switch /1 (MS1)
[3]	Door open/close sensor /1 (PS1)	[4]	Door open/close sensor /2 (PS2)
[5]	Interlock switch /2 (MS2)	[6]	Scanner home sensor (PS51)
[7]	Scanner cooling fan (FM19)	[8]	L4 inverter (L4 INVB)
[9]	APS sensor /1 (PS52)	[10]	APS sensor /2 (PS53)
[11]	CCD board (CCDB)	-	

1.1.5 Main body upper surface 2

[1]	Hard disk /1 (HDD1)	[2]	Relay board /U (RBU)*1
[3]	Air separation motor encoder sensor (PS30)	[4]	Sub power switch (SW2)
[5]	Air separation motor (M10)	[6]	Charger suction fan (FM3)
[7]	Image processing cooling fan (FM12)	[8]	Image processing board (IPB)

*1 PRO 951 is unimplemented.

1.1.6 Main body right side

[1]	Suction cooling fan /1 (FM6)	[2]	Temperature-humidity sensor /1 (TEM/HUM1)
[3]	Developing cooling fan (FM31)	[4]	Suction cooling fan /2 (FM7)

1.1.7 Main body left side

[1]	Paper exit cooling fan /Up (FM4)	[2]	Paper exit cooling fan /Lw2 (FM28)
[3]	Paper exit cooling fan /Lw1 (FM10)	[4]	Pump cooling fan (FM11)
[5]	Paper exit sensor (PS3)	-	

1.1.8 Main body front side

[1]	Front cooling fan (FM18)	[2]	Total counter (CNT1)
[3]	Relay board /A (RBA)	[4]	Main power switch (SW1)

1.1.9 Write section (LPH)

[1]

[1]	LPH board (LPHB)	-
-----	------------------	---

1.1.10 Photo conductor section

[1]	Drum claw solenoid (SD10)	[2]	Toner control board (TCB)
[3]	JAM sensor board (JAMB)	[4]	Drum potential sensor (DPS)
[5]	Drum potential sensor board (DPSB)	[6]	Drum temperature sensor (TH5)

1.1.11 Charging section

[1]	Charger cleaning home sensor (PS26)	[2]	Charger cleaning limit sensor (PS27)
[3]	Charger cleaning motor (M23)	[4]	Erase lamp (EL)

1.1.12 Developing section

[1]	TCR sensor (TCRS)	-
-----	-------------------	---

1.1.13 Toner supply section 1

[1]	Hopper toner remaining sensor /1 (PS32)	[2]	Hopper toner remaining sensor /2 (PS33)
[3]	Door switch /2 (SW5)	[4]	Temperature-humidity sensor /2 (TEM/HUM2)
[5]	Toner bottle cooling fan (FM35)	[6]	Cup section toner remaining sensor (PS34)
[7]	Toner hopper motor (M7)	[8]	Toner bottle motor (M6)

1.1.14 Toner supply section 2

[1]	Intermediate hopper toner remaining sensor (PS39)	[2]	Intermediate hopper motor (M11)
-----	---	-----	---------------------------------

1.1.15 Toner collection section

[1]	Waste toner box set sensor (PS14)	[2]	Waste toner box swing motor (M19)
[3]	Waste toner box swing sensor (PS15)	[4]	Waste toner full sensor /1 (PS37)

1.1.16 Cleaning section

[1]	Blade motor (M22)	[2]	Blade sensor /1 (PS24)
[3]	Blade sensor /2 (PS25)	-	

1.1.17 Paper feed section 1

[1] Paper feed assist fan /Fr1 (FM21), /Fr2 (FM23)*1	[2] CD paper size VR/1 (VR2), /2 (VR5)
[3] Paper empty sensor /1 (PS8), /2 (PS12)	[4] Paper feed assist fan /Rr1 (FM20), /Rr2 (FM24)*1
[5] Upper limit sensor /1 (PS6), /2 (PS10)	[6] Paper feed sensor /1 (PS7), /2 (PS11)
[7] Pick-up solenoid /1 (SD3), /2 (SD4)	[8] Handle release sensor /1 (PS9), /2 (PS13)

*1 PRO 951 is unimplemented.

1.1.18 Paper feed section 2

[1] FD paper size VR/1 (VR3), /2 (VR6)	[2] Separation clutch /1 (CL5), /2 (CL7) *1
[3] Remaining paper VR/1 (VR1) and VR/2 (VR4)	[4] Tray lift-up motor /1 (M25), /2 (M34)
[5] Paper feed clutch /1 (CL4), /2 (CL6)	-

*1 PRO 951 is unimplemented.

1.1.19 Paper feed section 3

[1] Dehumidification heater /1 (HTR1)	[2] Dehumidification heater /2 (HTR2)
[3] Tray lock solenoid /2 (SD2)	[4] Tray lock solenoid /1 (SD1)

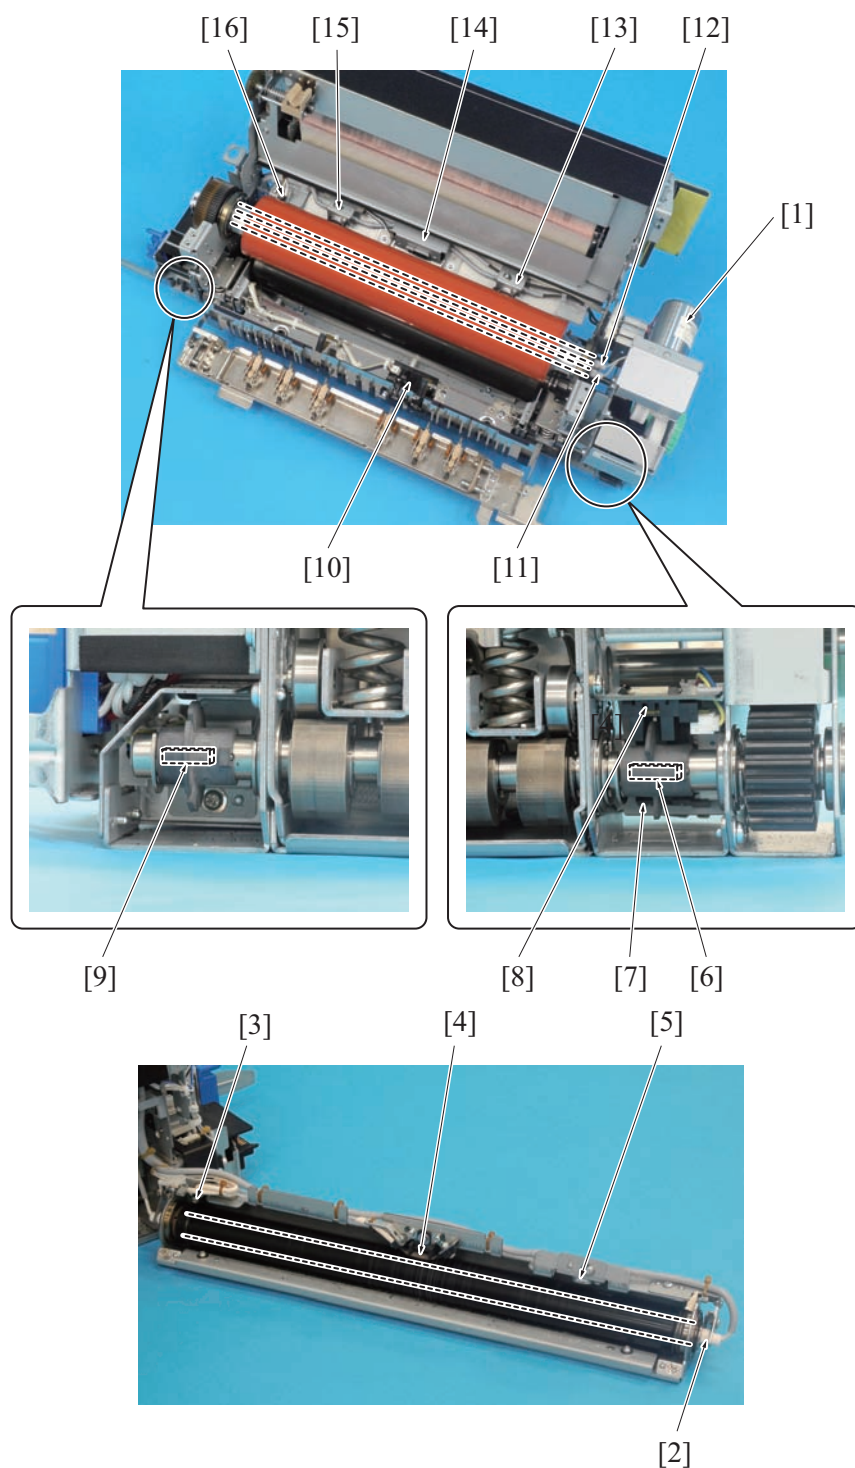

1.1.20 Vertical conveyance section

[1]	Vertical conveyance sensor /1 (PS19)	[2]	Vertical conveyance sensor /2 (PS20)
[3]	Vertical conveyance sensor /3 (PS21)	[4]	Door switch /1 (SW4)
[5]	Pre-registration sensor /2 (PS18)	[6]	Pre-registration clutch /2 (CL3)
[7]	Vertical conveyance clutch (CL2)	[8]	Pre-registration clutch /1 (CL1)
[9]	Loop sensor (PS16)	[10]	Pre-registration sensor /1 (PS17)

1.1.21 Registration section

[1]	Centering sensor(PS4)	[2]	Paper leading edge sensor (PS41)
[3]	Multi-feed detection board /S (MFDBS) *1	[4]	Registration sensor (PS40)
[5]	ADU deceleration sensor (PS42)	[6]	Multi-feed detection board /R (MFDBR) *1
[7]	Paper skew sensor /Rr (PS66) *1	[8]	Paper skew sensor /Fr (PS65) *1

*1 PRO 951 is unimplemented

1.1.22 Fusing section

[1]	Fusing pressure release motor (M33) *1	[2]	Fusing heater lamp /3 (L3)
[3]	Fusing temperature sensor /4 (TH4)	[4]	Fusing temperature sensor /3 (TH3)
[5]	Thermostat /3 (TS3)	[6]	Fusing pressure position sensor /3 (PS61)*1
[7]	Fusing pressure position sensor /1 (PS59)*1	[8]	Fusing pressure position sensor /2 (PS60)*1
[9]	Fusing pressure home sensor (PS58)*1	[10]	Fusing jam sensor (PS38)
[11]	Fusing heater lamp /2 (L2)	[12]	Fusing heater lamp /1 (L1)
[13]	Thermostat /1 (TS1)	[14]	Fusing temperature sensor /1 (TH1)
[15]	Thermostat /2 (TS2)	[16]	Fusing temperature sensor /2 (TH2)

*1 PRO 951 is unimplemented.

1.1.23 Duplex section 1

[1]	Paper stay sensor /2 (PS63)	[2]	ADU exit sensor (PS43)
[3]	ADU conveyance sensor /2 (PS36)	[4]	ADU conveyance sensor /1 (PS35)
[5]	Reverse sensor /2 (PS47)	[6]	Reverse sensor /1 (PS48)
[7]	ADU reverse paper exit sensor (PS50)	[8]	De-curler entrance sensor (PS23)
[9]	Fusing exit sensor (PS22)	[10]	ADU accelerate sensor (PS49)
[11]	Temperature sensor (TEM)	[12]	ADU reverse sensor /2 (PS45)
[13]	Paper stay sensor /1 (PS64)	-	

1.1.24 Duplex section 2

[1]	Registration motor (M17)	[2]	ADU drive board /2 (ADUDB2)
[3]	Loop motor (M18)	[4]	Registration cooling fan (FM17)
[5]	ADU lock solenoid (SD6)	[6]	Reverse/exit motor (M13)
[7]	Sensor cooling fan /1 (FM16)	[8]	Sensor cooling fan /2 (FM40)
[9]	Reverse cooling fan (FM38)	[10]	ADU acceleration motor (M14)
[11]	ADU cooling fan /1 (FM14)	[12]	ADU drive board /1 (ADUDB1)
[13]	Transfer belt cleaning fan (FM27)	[14]	ADU reverse motor (M12)
[15]	Belt cooling fan (FM37)	[16]	ADU conveyance motor /2 (M16)
[17]	ADU handle release sensor (PS44)	-	

1.1.25 Duplex section 3

[1]	ADU conveyance motor /1 (M15)	[2]	ADU cooling fan /2 (FM15)
[3]	Transfer belt motor (M30)	[4]	High voltage unit /2 (HV2)

1.1.26 Duplex section 4

[1]	Transfer belt pressure release motor (M26)	[2]	Transfer pressure home sensor (PS54)
[3]	Transfer pressure position sensor /2 (PS56)	[4]	Transfer pressure position sensor /1 (PS55)

1.1.27 Reverse/exit section

[1]	ADU cooling fan /3 (FM13)	[2]	De-curler fan /1 (FM29)
[3]	De-curler fan /2 (FM30)	[4]	De-curler motor (M32)
[5]	De-curler solenoid /Up (SD8)	[6]	De-curler solenoid /Lw (SD5)*1
[7]	Reverse/exit solenoid (SD7)	-	

*1 PRO 951 is unimplemented.

1.1.28 Operation panel section

[1]	Operation board /3 (OB3)	[2]	Operation board /1 (OB1)
[3]	LCD board (LCDB)	[4]	Operation board /2 (OB2)

[5]	Speaker (SP)	-
-----	--------------	---

1.2 DF-615 /616

1.2.1 Front side

[1]	Exit gate solenoid (SD304)	[2]	Pressure roller release solenoid (SD302)
[3]	Gate solenoid (SD303)	[4]	DF open-close sensor (PS301)

1.2.2 Rear side

[1]	Original conveyance motor (M302)	[2]	Original skew sensor /Fr (PS312)
[3]	Original conveyance sensor (PS308)	[4]	Original skew sensor /Rr (PS311)
[5]	Cooling fan /Lt (FM301)	[6]	APS timing sensor (PS317)
[7]	Original feed motor (M301)	[8]	SDF switching solenoid (SD301)
[9]	Original exit motor /1 (M303)	[10]	Original exit motor /2 (M304)
[11]	DF control board (DFCB)	[12]	Cooling fan /Rt (FM302)
[13]	Tray up-down motor (M305)	[14]	Cover open-close switch (MS301)
[15]	Tray lower limit sensor (PS316)	-	

1.2.3 Upper surface

[1] Original count sensor (PS310)	[2] Original size sensor /Lt (PS303)
[3] Original size sensor /Rt (PS302)	[4] Reverse jam sensor (PS304)
[5] Original empty sensor (PS305)	[6] Tray upper limit sensor (PS315)
[7] Original registration sensor /Rt (PS318) (DF-615 only)	[8] Multi feed detection board /R (MFDBR) (DF-615 only)
[9] Multi feed detection board /S (MFDBS) (DF-615 only)	[10] Original registration sensor /Lt (PS306)
[11] Original reverse sensor (PS309)	[12] Centering LED sensor /Fr (PS319) (DF-615 only)
[13] Centering sensor /Fr (PS320) (DF-615 only)	[14] Centering sensor /Rr (PS321) (DF-615 only)
[15] Centering LED sensor /Rr (PS322) (DF-615 only)	[16] Original exit sensor /Lt (PS307)

1.2.4 Upper tray rear side

df603fs5004c

[1] Tray board (TB)	[2] Original size VR (VR301)
---------------------	------------------------------

1.2.5 Reverse tray rear side

df603fs5005c

[1] Original exit sensor/Rt (PS314)	[2] Original reverse-exit sensor (PS313)
-------------------------------------	--

1.3 PF-703/HT-505/FA-501

1.3.1 Configuration section

a0g6f5c200ca

[1] Tray lock solenoid /1 (SD1)	[2] Horizontal conveyance exit clutch (CL6)
[3] Pre-registration clutch /2 (CL3)	[4] Tray lock solenoid /2 (SD2)
[5] Intermediate clutch /2 (CL4)	[6] Tray lock solenoid /3 (SD3)
[7] Pre-registration clutch /3 (CL15)	[8] Paper feed motor (M1)
[9] Noise filter (NF)	[10] DC power supply /1 (DCPS/1)
[11] Paper feed belt motor (M2)	[12] PF drive board (PFUDB)
[13] Coupling conveyance motor /1 (M4)	[14] Temperature-humidity sensor (TEM/HUMS)
[15] Coupling conveyance motor /2 (M5)	[16] PF cooling fan /2 (FM20)
[17] Coupling conveyance motor /3 (M6)	[18] Pre-registration clutch /1 (CL1)
[19] Intermediate clutch /1 (CL2)	[20] PF cooling fan /1 (FM19)
[21] PF cooling fan /3 (FM21)	[22] Interlock switch (MS1)
[23] Door open/close sensor (PS1)	-

1.3.2 Horizontal conveyance section

a0g6f5c201ca

[1]	Horizontal conveyance sensor /5 (PS35)	[2]	Horizontal conveyance sensor /4 (PS34)
[3]	Horizontal conveyance sensor /3 (PS33)	[4]	Horizontal conveyance sensor /2 (PS32)

[1]	Pre-registration sensor /2 (PS18)	[2]	Loop sensor /3 (PS23)
[3]	Loop sensor /2 (PS19)	[4]	Intermediate sensor /Lw (PS22)
[5]	Pre-registration sensor /3 (PS20)	[6]	Vertical conveyance sensor /3 (PS21)
[7]	Vertical conveyance door switch /Lw (SW2)	[8]	Loop sensor /1 (PS17)
[9]	Intermediate sensor /Up (PS16)	[10]	Vertical conveyance door switch /Up (SW1)
[11]	Vertical conveyance sensor /1 (PS15)	[12]	Pre-registration sensor /1 (PS14)

1.3.4 EXIT CONVEYANCE SECTION

a0g6f5c203ca

[1]	PF exit conveyance motor (M3)	[2]	Horizontal conveyance door switch (SW3)
[3]	PF exit conveyance sensor (PS24)	-	

1.3.5 Paper feed tray section 1

a0g6f5c204ca

[1]	Temperature sensors /1 (TEMS/1), /2 (TEMS/2), /3 (TEMS/3)	[2]	Paper feed assist fan /Rr1 (FM2), /Rr2 (FM6), /Rr3 (FM12)
[3]	Shutter solenoid /Rr1 (SD5), /Rr2 (SD7), /Rr3 (SD9)	[4]	CD paper size VR/1 (VR2), /2 (VR5), /3 (VR8)
[5]	FD paper size VR/1 (VR3), /2 (VR6), /3 (VR9)	[6]	Handle release sensors /1 (PS4), /2 (PS8), /3 (PS12)
[7]	Shutter solenoid /Fr1 (SD4), /Fr2 (SD6), /Fr3 (SD8)	[8]	Paper feed assist fan /Fr1 (FM1), /Fr2 (FM5), /Fr3 (FM9)
[9]	Paper empty sensors /1(PS3), /2 (PS7), /3 (PS11)	[10]	Paper feed sensors /1 (PS5), /2 (PS9), /3 (PS13)
[11]	Paper feed sensor /1 (PS2), /2 (PS6), /3 (PS10)	-	

1.3.6 Paper feed tray section 2

a0g6f5c205ca

[1]	Paper lift motor /1 (M7), /2 (M8), /3 (M9)	[2]	Paper leading edge separation fan /Fr1 (FM3), /Fr2 (FM7), /Rr3 (FM11)
[3]	Paper leading edge separation fan /Rr1 (FM4), /Rr2 (FM8), /Rr3 (FM12)	[4]	Remaining paper VR /1 (VR1), /2 (VR4), /3 (VR7)
[5]	Paper leading edge shutter solenoid /1 (SD10), /2 (SD11), /3 (SD12)	-	

1.3.7 Paper feed suction section

a0g6f5c206ca

[1] Shutter motor /1 (M10), /2 (M11), /3 (M12)	[2] Paper suction fan /1 (FM13), /3 (FM15), /5 (FM17)
[3] Paper suction fan /2 (FM14), /4 (FM16), /6 (FM18)	[4] Shutter home sensor /1 (PS37), /2 (PS38), /3 (PS39)
[5] Paper feed clutch /1 (CL7), /2 (CL8), /3 (CL9)	[6] Paper suction sensors /Rr1 (PS26), /Rr2 (PS28), /Rr3 (PS30)
[7] Paper suction sensors /Fr1 (PS25), /Fr2 (PS27), /Fr3 (PS29)	-

1.3.8 FA-501 (Option) 1

a0g6f5c207ca

[1] Multi feed detection board /S (MFDBS)	[2] PF exit conveyance motor (M3)
[3] Multi feed detection drive board (MFDDDB)	[4] Horizontal conveyance door switch (SW3)
[5] Multi feed detection board /R (MFDBR)	[6] PF exit conveyance sensor /1 (PS24)
[7] PF exit conveyance sensor /2 (PS36)	-

1.3.9 FA-501 (Option) 2

a0g6f5c208ca

[1] DC power supply /2 (DCPS/2)	-
---------------------------------	---

1.3.10 HT-505 (Option)

a0gdt3c128ca

[1]	Temperature sensor /5 (TEMS/5), /6 (TEMS/6), /7 (TEMS/7)	[2]	Dehumidifier fans /Rt1 (FM22), /Rt2 (FM24), /Rt3 (FM26)
[3]	Dehumidifier fans /Lt1 (FM23), /Lt2 (FM25), /Lt1 (FM27)	[4]	Dehumidification heaters /1 (HTR1), /2 (HTR2), /3 (HTR3)
[5]	Dehumidifier fan heater unit /3	[6]	AC drive board /2 (ACDB/2)
[7]	Dehumidifier fan heater unit /2	[8]	Dehumidifier fan heater unit /1

1.4 PF-706/PP-701

1.4.1 Configuration front side

pf701fs5001c

[1]	Dehumidification heater /1 (HTR1)	[2]	Dehumidification heater /2 (HTR2)
[3]	Dehumidification heater /3 (HTR3)	[4]	Tray lock solenoid /3 (SD3)
[5]	Tray lock solenoid /2 (SD2)	[6]	Tray lock solenoid /1 (SD1)

1.4.2 Configuration left side/exit conveyance section

pf701fs5002c

[1] Door open/close sensor (PS1)	[2] Interlock switch (MS1)
[3] Paper feed motor (M1)	[4] PF exit conveyance sensor (PS24)
[5] Horizontal conveyance door switch (SW3)	[6] PF exit conveyance motor (M2)

1.4.3 Configuration rear side

a0g6f5c001ca

[1] Pre-registration clutch /1 (CL1)	[2] Intermediate clutch /Up (CL2)
[3] PF cooling fan (FM7)	[4] Pre-registration clutch /2 (CL3)
[5] Intermediate clutch /Lw (CL4)	[6] Pre-registration clutch /3 (CL5)
[7] Temperature sensor (TEMS)	[8] PF drive board (PFUDB)

1.4.4 Vertical conveyance section

pf701fs5004c

[1] Pre-registration sensor /1 (PS14)	[2] Vertical conveyance sensor /1 (PS15)
[3] Intermediate sensor /Up (PS16)	[4] Loop sensor /1 (PS17)
[5] Pre-registration sensor /2 (PS18)	[6] Loop sensor /3 (PS23)
[7] Intermediate sensor /Lw (PS22)	[8] Vertical conveyance sensor /2 (PS21)
[9] Pre-registration sensor /3 (PS20)	[10] Loop sensor /2 (PS19)
[11] Vertical conveyance door switch /Lw (SW2)	[12] Vertical conveyance door switch /Up (SW1)

1.4.5 Tray section 1

pf701fs5005c

[1]	Paper feed assist fan /Fr1 (FM1), /Fr2 (FM3), /Fr3 (FM5)	[2]	Pick-up solenoid /1 (SD4), /2 (SD5), /3 (SD6)
[3]	Paper feed sensor /1 (PS3), /2 (PS7), /3 (PS11)	[4]	Upper limit sensor /1 (PS2), /2 (PS6), /3 (PS10)
[5]	Paper lift motor /1 (M42), /2 (M43), /3 (M44)	[6]	Remaining paper VR /1 (VR1), /2 (VR4), /3 (VR7)
[7]	Forced separation clutch /1 (CL8), /2 (CL11), /3 (CL14)	[8]	Separation clutch /1 (CL7), /2 (CL10), /3 (CL13)
[9]	Paper feed clutch /1 (CL6), /2 (CL9), /3 (CL12)	[10]	Paper feed assist fan /Rr1 (FM2), /Rr2 (FM4), /Rr3 (FM6)

1.4.6 Tray section2

a0g6f5c002ca

[1]	Paper empty sensor /1 (PS4), /2 (PS8), /3 (PS12)	[2]	CD paper size VR /1 (VR2), /2 (VR5), /3 (VR8)
[3]	FD paper size VR /1 (VR3), /2 (VR6), /3 (VR9)	-	

1.4.7 PP-701 (Option)

a08rf5c001ca

[1]	Paper trailing edge separation fan /1 (FM8)	[2]	Paper trailing edge separation fan /2 (FM9)
-----	---	-----	---

[3] Paper trailing edge separation fan /3 (FM10)	[4] Front side direction
--	--------------------------

1.5 LU-409/410

[1] Tray down switch (SW100)	[2] Front door interlock switch (MS101)
[3] Front door open/close sensor (PS110)	[4] Pick-up solenoid (SD100)
[5] Upper limit sensor (PS109)	[6] LU exit sensor (PS106)
[7] Pre-registration clutch (CL102)	[8] Paper feed motor (M101)
[9] LU drive board (LUDB)	[10] Dehumidification heater (HTR101)
[11] Lower limit sensor (PS101)	[12] Remaining paper sensor /4 (PS105)
[13] Remaining paper sensor /3 (PS104)	[14] Remaining paper sensor /2 (PS103)
[15] Remaining paper sensor /1 (PS102)	[16] Paper lift motor (M100)
[17] Paper feed clutch (CL101)	[18] Upper door open/close sensor (PS100)
[19] Upper door interlock switch (MS102)	[20] Pre-registrations sensor (PS107)
[21] Paper empty sensor (PS108)	-

1.6 EF-102

For details, refer to "[L.1.1.22 Fusing section](#)".

1.7 RU-509/HM-102**1.7.1 Right side**

[1]	Entrance sensor (PS1)	[2]	Entrance paper fan /6 (FM17)
[3]	Entrance paper fan /5 (FM16)	[4]	Entrance paper fan /4 (FM15)
[5]	Entrance paper fan /9 (FM20)	[6]	Entrance paper fan /8 (FM19)
[7]	Entrance paper fan /7 (FM18)	[8]	De-curler entrance sensor (PS2)
[9]	Door switch (SW1)	[10]	Entrance paper fan /1 (FM1)
[11]	Entrance paper fan /2 (FM2)	[12]	Entrance paper fan /3 (FM3)

M TIMING CHART

1. bizhub PRESS 1250/1250P/1052

1.1 Timing chart when sub power switch turns ON

a0g6f5e800ca

[1]	Sub power switch (SW2) ON	[2]	Initial communication between the overall control board (OACB) and the printer control board (PRCB)
[3]	Shading correction starts	[4]	Fusing temperature sensors /1 (TH1) and /3 (TH3) get to the specified temperature
[5]	Start of consumable stabilization control	[6]	Image stabilization control starts (batch modification for drum rotation)
[7]	Warming-up completed	-	

Note

- Various types of operations vary depending on the software DIPSW setting and the environmental settings in the service mode.
- The power is ON with the DF closed.
- The power is turned ON with the paper lift plate of the tray brought down.

1.2 Timing chart of the simplex mode

1.2.1 Operation condition

A4, x1.0, 2 simplex originals, 1Set simplex copy, Reversal Output, Feed Tray1

1.2.2 Timing chart

1. INTERFACE SECTION

1.1 Configuration

1.1.1 Main body right side

	Item	Specifications
[1]	Serial port (RS-232C) for the image controller	Not used
[2]	RJ45 Ethernet connector for the image controller	For the network connection of the image controller
[3]	USB port (USB TypeA) for the image controller	For service (Log information acquisition) /For ISW of the image controller
[4]	USB port (USB TypeB) for the image controller	For the USB connection of the image controller/For the local print
[5]	Pre-processing unit connecting connector	For the pre-processing unit connection
[6]	Service port (USB TypeA)	For ISW of main body, option For service (Log information acquisition)
[7]	Serial port (RS-232C)	For CS Remote Care
[8]	RJ45 Ethernet connector	For Internet ISW/Web Utilities/Mail remote notification system

1.1.2 Main body left side

	Item	Specifications
[1]	Post-processing unit connecting connector	For the post-processing unit connection

1.1.3 Main body upper side

a0g6t2c006ca

	Item	Specifications
[1]	Connecting port (TypeA)*1	Keyboard, mouse and BoxExplorer (USB Memory, USB-HDD) for ISW of the copier/printer program

*1 PRO 951 is unimplemented.

2. SCANNER SECTION

2.1 Configuration

1050to2006c

[1]	CCD lens	[2]	CCD board (CCDB)
[3]	L4 inverter (L4 INVB)	[4]	Exposure lamp (L4)
[5]	V-mirror unit	[6]	Scanner cooling fan (FM19)
[7]	Exposure unit	[8]	Scanner home sensor (PS51)
[9]	APS sensor /1 (PS52)	[10]	APS sensor /2 (PS53)

2.2 Drive

1050to2007c

[1]	Scanner wire /Fr	[2]	V-mirror unit
[3]	Scanner motor (M27)	[4]	Scanner wire /Rr
[5]	Exposure unit	-	

2.3 Operation

2.3.1 Control when the sub power is turned ON

- When the power switch (SW2) is turned ON, the exposure unit conducts the home position search and the shading correction.

(1) Home position search

- The operation of the home position search varies depending on the ON/OFF condition of the scanner home sensor (PS51) [2].

(a) When the scanner home sensor (PS51) is OFF

1050to2008c

[1]	Position at which the original glass APS is read	[2]	Scanner home sensor (PS51)
-----	--	-----	----------------------------

(b) When the scanner home sensor (PS51) is ON

1050to2009c

[1]	Position at which the original glass APS is read	[2]	Scanner home sensor (PS51)
-----	--	-----	----------------------------

(2) Shading correction

- After completion of the home position search [3], the exposure unit conducts shading corrections.
- There are 3 types of shading corrections: white correction 1 [4], white correction 2 [5] and black correction [6].
- For the shading correction at the time of the power ON, each correction is carried out in a series of operations.

1050to2010c

[1]	Position at which the APS is read	[2]	Scanner home sensor (PS51)
[3]	Home position search terminated	[4]	White correction 1
[5]	White correction2	[6]	Black correction
[7]	Home position search	[8]	Standby position while in the DF mode
[9]	Exposure lamp (L4) ON	[10]	Movement of the exposure lamp

2.3.2 Control when the start button is turned ON

(1) When using original glass

- When the start button is turned ON, the exposure unit conducts the shading correction and then the exposure scan.
- When the AE/AES is selected, the AE/AES scan [7] is made before the exposure scan is made.
- For the shading correction while in the exposure scan, the black correction is not conducted because of the exposure lamp being left turned on.

(a) While in the AE/AES copy

1050to2011c

[1]	Position at which the APS is read	[2]	Scanner home sensor (PS51)
[3]	DF close	[4]	Start key ON
[5]	White correction 1	[6]	White correction2
[7]	AE/AES scan	[8]	Position at which the original is read
[9]	Home position search	[10]	Exposure lamp (L4) ON
[11]	Movement of the exposure lamp	-	

(b) While in the manual copy

1050to2012c

[1]	Position at which the APS is read	[2]	Scanner home sensor (PS51)
[3]	DF close	[4]	Start key ON
[5]	White correction 1	[6]	White correction2
[7]	Position at which the original is read	[8]	Home position search
[9]	Exposure lamp (L4) ON	[10]	Movement of the exposure lamp

(2) When the DF is in use

- When the start button is turned ON [3], the exposure unit conducts the shading correction and then moves to the position at which the DF is read.
- The same operations are made when the AE/AES is selected.
- For the shading correction in the DF mode, the black correction is not made because of the exposure lamp being left turned on.

1050to2013c

[1]	Position at which the APS is read	[2]	Scanner home sensor (PS51)
[3]	Start key ON	[4]	White correction 1
[5]	White correction2	[6]	Position at which the original is read
[7]	Home position search	[8]	Exposure lamp (L4) ON
[9]	Movement of the exposure lamp	-	

2.3.3 Original size detection control

(1) Detection method

- The DF mode and the original glass mode is different.

(a) DF mode

- Refer to: [DF-615/616 Size Detection Control](#)

(b) In original glass mode

- In the direction of the main scan : CCD sensor
- In the direction of the sub-scan: the combination of the ON/OFF of the APS sensor /1 (PS52) and the APS sensor /2 (PS53).

Original size	CCD sensor (Length of detection: mm)	PS52 ON/OFF	PS53 ON/OFF
Smallest	102. 0	OFF	OFF
B6S	128. 0	OFF	OFF
B5S	182. 0	ON	OFF
B5	257. 0	OFF	OFF
B4	257. 0	-	ON
A5S	148. 0	OFF	OFF
A5	210. 0	OFF	OFF
A4S	210. 0	ON	OFF
A4	297. 0	OFF	OFF
A3	297. 0	-	ON
Wide paper	304. 8	-	ON
5 ¹ / ₂ x 8 ¹ / ₂ S	139. 7	OFF	OFF
5 ¹ / ₂ x 8 ¹ / ₂	215. 9	OFF	OFF
8 ¹ / ₂ x 14	215. 9	-	ON
8 ¹ / ₂ x 11S	215. 9	ON	OFF
8 ¹ / ₂ x 11	279. 4	OFF	OFF
11 x 17	279. 4	-	ON

* For "-" in the table above, either of ON and OFF is acceptable as a result of the detection.

(2) Detection timing

1050to2016e

[1] 1st original size detection (with DF closed)	[2] 2nd original size detection
--	---------------------------------

2.3.4 AE control

- When the AE/AES is selected, the density level of the original is detected automatically to adjust it to an appropriate density.
- The sampling range of the original density when the AE/AES is controlled is different for the original glass mode and the DF mode.

(1) AE/AES sampling range In original glass mode

1050to2014c

[1] 30mm	-
----------	---

(2) AE/AES sampling range in the DF mode

1050to2015c

[1] 4mm	[2] 1mm
---------	---------

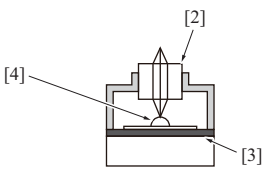

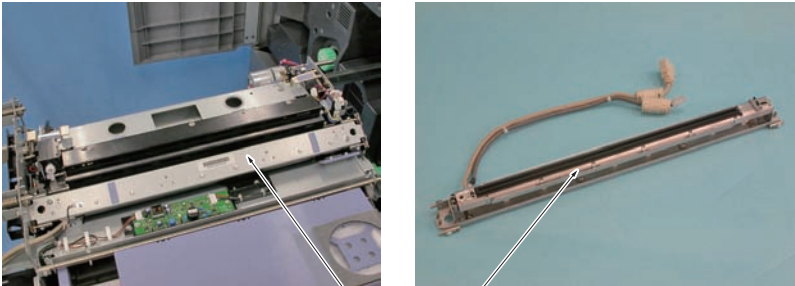

2.3.5 IMAGE PROCESSING

There are following items for the image processing. For details, refer to [O.18. IMAGE PROCESSING](#).

- Shading correction
- AE/AES processing
- Area discrimination
- Brightness/density conversion
- Filter/magnification
- Density gamma (conversion)
- Halftone processing (error diffusion)
- Skew correction
- Compression
- Storage of image data

3. WRITING SECTION (LPH)

3.1 Configuration

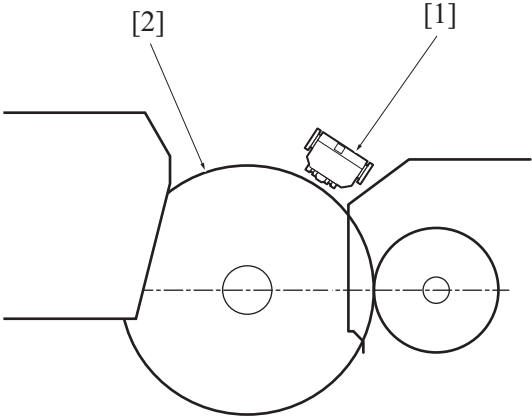

[1]	LPH	[2]	SELFOC Lens Array
[3]	LPH board (LPHB)	[4]	LED

3.2 Operation

3.2.1 Exposure path

- An analog image data read by the CCD sensor is AD converted by the CCD board (CCDB) before being sent out to the image processing board (IPB) for data processing.
- The processed data is transmitted to the LPH board (LPHB) via the relay board /A (RBA) and then converted to the LED light emission signal.
- The LED light emission signal controls the length of time of the LED light radiation to the drum.
- LPH is an exposure device of solid-scanning type which consists of the LED devices and the SELFOC lens through which the light irradiated from the LED device forms an image on the drum.
- The LPHB is mounted on the photo conductor section and forms an electrostatic latent image by irradiating the LED light at a certain angle to the drum.

[1]	LPH	[2]	Drum
-----	-----	-----	------

3.2.2 IMAGE STABILIZATION CONTROL

(1) Auto dot diameter adjustment

- (a) Purpose
- Correction for the change of the drum sensitivity.
 - Retaining of the reproducibility of thin line.
 - Correction of the LED light volume of LPH.
- (b) Control outline
1. The drum potential sensor (DPS) measures the charged potential of the unexposed part before making a patch.
 2. It forms a specified number of patches with different LPH exposure time setting and calculates the exposure time that it takes to obtain the preset value of the charged potential for each patch.

It performs the operation at the line speed 570 mm/s (common to PRO1250/1250P/1052).

(c) Execution timing

- When performing the auto dot diameter adjustment in the service mode.

4. PHOTO CONDUCTOR SECTION

4.1 Configuration

[1]	Drum potential sensor board (DPSB)	[2]	Drum potential sensor (DPS)
[3]	Drum temperature sensor (TH5)	[4]	IDC sensor
[5]	Toner control board (TCB)	[6]	Duct
[7]	JAM sensor board (JAMB)	[8]	Drum claw
[9]	Drum	-	

4.2 Drive

4.2.1 Drum drive

[1]	Drum motor (M2)	[2]	Registration exit roller drive coupling
[3]	Drum	[4]	Registration exit roller
[5]	Flywheel	-	

4.2.2 Drum claw drive

[1]	Drum claw	[2]	Spring
[3]	Cam	[4]	Drum claw solenoid (SD10)
[5]	Drum cleaner motor (M35) drive input gear via cleaning section	[6]	Projection

4.3 Operation

4.3.1 Drum claw drive

(1) Purpose

- To prevent the occurrence of a drum wrap jam, 3 drum claws are employed to prevent the drum from being wrapped with the copy paper.
- The contact and the release of contact of the drum claws onto the drum is made by turning ON/OFF the drum claw solenoid (SD10).

(2) Oscillation operation

- To prevent the transfer paper from getting soiled in certain areas and the drum from being damaged, the drum claws oscillate front to rear on the drum surface about 8mm.
- There is a projection on the rear side of the drum claw unit. A cam provided on the gear presses this projection to push the drum claw unit to the front side.
- When the gear rotation releases the cam, the drum claw unit is returned to its former position by the spring.
- Repeating the above operation oscillates the drum claws.

4.3.2 IMAGE STABILIZATION CONTROL

(1) Drum potential correction

- The drum potential is controlled to keep the image quality at a fixed level at all times, regardless of the operating environment and the number of prints.
- For the drum potential correction control, it measures the potential of the exposed part (black) to adjust the charging current, the grid voltage and the developing bias potential so.
- For details, refer to "O.17. Image stabilization control."

(a) Execution timing

- When the fusing temperature is below 50°C with the power switch (SW2) ON.
- When the prescribed condition (number of prints) is met.

(2) Environmental decision control

- The drum temperature sensor (TH5) and the temperature sensor /3 of PF (TEMS/3) detect the temperature of the environment in which the main body is installed, and the temperature-humidity sensor /1 (TEM/HUM1) and /2 (TEM/HUM2) detect the environmental humidity.
- Each detected data is used as information to keep the image quality at a fixed level.
- For details, refer to "[O.17. Image stabilization control.](#)"

(a) Execution timing

- When the prescribed conditions are met with the SW2 ON.

(3) Drum rotation control

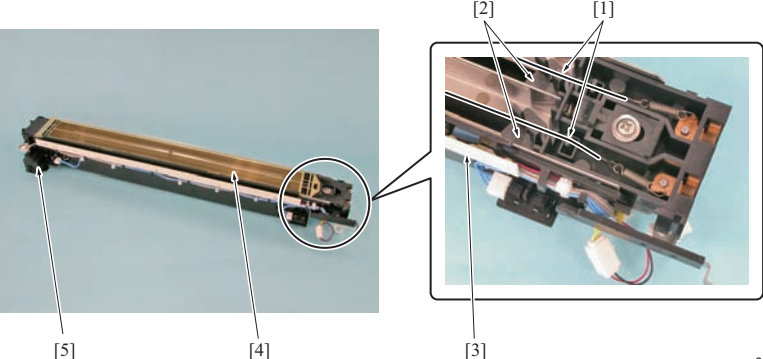

- Under the environments of low humidity and normal humidity and an blurred image in high humidity, the drum surface that borders the developing unit and the cleaning unit has different surface sensitivity from that borders nothing.
- When printing is made under this condition, uneven printing is made in the sub scan direction of the paper.
- To prevent this uneven printing, the drum is rotated at a fixed cycle for a prescribed period of time to obtain a uniform surface sensitivity.
- For details, refer to "[O.17. Image stabilization control.](#)"

(a) Execution timing

- Once every 3minutes while in idling
- Once every hour while in the low-power mode
- When the prescribed conditions are met with the SW2 ON

5. CHARGING SECTION

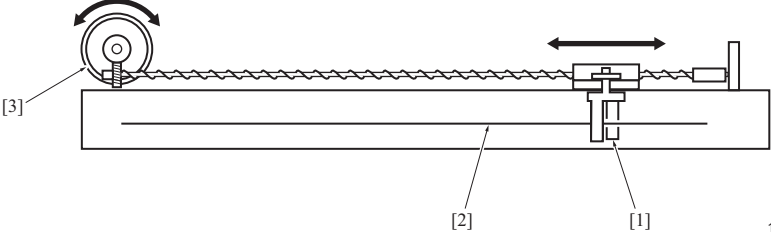

5.1 Configuration

a0g6t2c012ca

[1]	Charging wire	[2]	Charger cleaning member
[3]	Erase lamp (EL)	[4]	Charger control plate
[5]	Charger cleaning motor (M23)		-

5.2 Drive

1050to2024c

[1]	Charger cleaning member	[2]	Charging wire
[3]	Charger cleaning motor (M23)		-

5.3 Operation

5.3.1 Charging control

- (1) Charging wire
 - The high voltage unit /1 (HV1) uses 24V DC to create a negative charge current to the charging wire to charge the drum.
 - Charging output range: -350μA to -1150μA x 2 power source
- (2) Charging grid
 - To make the discharge of the charging wire uniform, a minus (-) high voltage is sent from the high voltage unit /1 (HV1) to the charging grid.
 - Charging grid voltage output range: -300V to -1000V

5.3.2 Wire cleaning control

- (1) Purpose
 - The wire is cleaned periodically to prevent the deterioration of the discharging characteristics caused by soil adhered to the charging wire.
- (2) Timing

The charging wire is cleaned under the following conditions:

 - The cleaning is made when the number of prints counted from the execution of the previous cleaning is in excess of the specified number with the power switch (SW2) ON, and when the fusing temperature is below 50°C.
 - While in the print, executed after completion of each job of the prescribed print counts.
 - After completion of the automatic replacement of the cleaning blade.
 - When executing [04 Charge Manual Cleaning] in the Adjustment screen.

Note

- The software DIPSW in the service mode specifies the number of prints at which the cleaning operation is conducted.

- (3) Cleaning operation
 - The home position of the cleaning member is provided on the rear side of the machine. It operates as following.

[1]	Charger cleaning limit sensor (PS27)	[2]	Charger cleaning home sensor (PS26)
[3]	Cleaning (going)	[4]	Cleaning (returning)
[5]	Home search (going)	[6]	Home search (returning)

5.3.3 Erase lamp control

(1) Purpose

- To neutralize the residual potential on the drum surface and to make the potential on the drum surface uniform, the erase lamp (EL) is turned on before charging.

(2) Timing for the erase lamp to be turned on

[1]	Drum motor (M2) ON	-
-----	--------------------	---

6. DEVELOPING SECTION

6.1 Configuration

[1]	TCR sensor (TCRS)	[2]	Agitator plate
[3]	Agitator screw	[4]	Toner recycle roller
[5]	Developing roller	[6]	Developer regulation blade

6.2 Drive

[1]	Gear for the agitator plate	[2]	Gear for the agitator screw
[3]	Gear for the developing roller	[4]	Developing roller drive coupling
[5]	Developing motor (M3)	[6]	Developing screw motor (M21)
[7]	Belt	[8]	Agitator screw drive coupling

6.3 Operation

6.3.1 Flow of developer

- Developer in the developing unit is supplied to the developing roller [3] by the agitator screws [2] and its level is kept at a fixed height by the developer regulation blade [6].
- There are 2 agitator screws equipped.
- The agitator plate [1] furthest from the developing roller is used to stabilize the charging characteristics of toner supplied to the developing unit.
- The toner recycle roller [4] collects the toner scattered and recovers it to the developing unit.

[1]	Agitator plate	[2]	Agitator screw
[3]	Developing roller	[4]	Toner recycle roller
[5]	Drum	[6]	Developer regulation blade

6.3.2 Developing bias

(1) Purpose

- A developing bias voltage is impressed onto the developing roller to expose latent images on the drum.
- The developing bias is provided by the developing bias pin [3] and is applied also to the developing regulation blade [4].
- There are 2 types of voltage applying route; applying to the developing roller shaft [1] and applying from the section /Rr [2] to the developing roller via the bearing.

[1]	Developing roller shaft	[2]	Section /Rr
[3]	Developing bias pin	[4]	Developer regulation blade
[5]	Section /Fr	-	

(2) Timing

- To prevent unnecessary carriers from adhering to the drum, developing bias turns ON a specified period of time before charging is ON, and it turns OFF a specified period of time after charging is OFF.

6.3.3 Developing suction

(1) Purpose

- The duct [7] partitioned one above the other is provided for the installing section of the developing unit.
- The lower tray of the duct is the suction path of air suctioned [5] by the developing cooling fan (FM31) [6]. It cools around the drum and the developing unit.
- The upper tray of the duct is the suction path for the toner scattering around the developing unit and the drum.
- The upper tray of the duct is connected to the developing suction assy [4]. It collects the toner scattering to the suction filter [1] in the developing suction assy by the suctioning of the developing suction fan (FM22) [2].
- Air passing through the suction filter is exhausted to the outside [3]

(2) Flow of air

[1]	Suction filter	[2]	Developing suction fan (FM22)
[3]	Exhaust	[4]	Developing suction assy
[5]	Suction	[6]	Developing cooling fan (FM31)
[7]	Duct	-	

(3) Developing suction fan control

- While in the print, the developing suction fan (FM22) turns ON when the drum motor (M2) turns ON, and it turns OFF a specified period of time after the M2 turns OFF.

(4) Developing cooling fan control

- While in the warm-up and the print, the developing cooling fan (FM31) turns ON when the drum motor (M2) turns ON, and it turns OFF a specified period of time after the M2 turns OFF.

6.3.4 Toner supply control

- It detects the toner density in the developing unit by the TCR sensor (TCRS) and supplies the toner when the toner density becomes low.

(1) Toner density detection control

- It monitors the output value of the TCR sensor (TCRS) at certain intervals while agitating the developer.

(2) Toner supply control

- The toner hopper motor (M7) turns ON according to the output value of the TCR sensor (TCRS).

6.3.5 IMAGE STABILIZATION CONTROL**(1) Maximum density control**

- The maximum density correction control is a control in which the patch, in images written under a fixed condition is developed while changing the speed of rotation of the developing roller. The resulting developed patch densities are compared to a reference density and when the developed patches are the same density as the reference patch, the developer roll speed is memorized.
- For details, refer to "[O.17. Image stabilization control.](#)"

(a) Execution timing

- When the fusing temperature is below 50°C with the SW2 ON.
- When the prescribed condition (number of prints) is met.

7. TONER SUPPLY SECTION

7.1 Configuration

[1]	Intermediate toner hopper	[2]	Intermediate hopper toner remaining sensor (PS39)
[3]	Toner bottle	[4]	Toner pump motor (M28)
[5]	Air pump motor (M29)	[6]	Air separation unit
[7]	Air separation motor (M10)	[8]	Cup section toner remaining sensor (PS34)
[9]	Toner hopper	[10]	Hopper toner remaining sensor /2 (PS33)
[11]	Hopper toner remaining sensor /1 (PS32)	-	

7.2 Drive

7.2.1 Toner bottle/large capacity hopper drive (1250/1250P/1052)

[1]	Toner bottle motor (M6)	[2]	Gear for the large capacity hopper agitator shaft
[3]	Mixing section agitator shaft gear	[4]	Toner hopper motor (M7)
[5]	Gear for the toner bottle rotation shaft	[6]	Toner bottle

7.2.2 Toner bottle/large capacity hopper drive (PRO951)

[1]	Toner bottle motor (M6)	[2]	Gear for the large capacity hopper agitator shaft
[3]	Mixing section agitator shaft gear	[4]	Toner hopper motor (M7)
[5]	Gear for the toner bottle rotation shaft	[6]	Toner bottle

7.2.3 Intermediate hopper/air separation drive

7.3 Operation

7.3.1 Toner supply to the toner hopper

(1) Purpose

- The toner supply section of the intermediate and low speed machines is equipped near the developing unit. For the high speed machine that deals with a large number of prints, a toner supply section of a large capacity is required and it is not possible to secure a sufficient space near the developing unit.
- So, it is inevitable to place the toner supply section in a location away from the developing unit. As a result, because the distance up to the toner supply section gets extended, a toner conveyance mechanism to deal with the long distance is required.
- As a toner conveyance device for the long distance, this machine employs the air conveyance method using the toner pump and the air pump.

(2) Toner conveyance path

1. Toner put in from the bottle [1] is conveyed to the large capacity hopper [2] by the agitator operation.
 2. When the toner supply operation starts, toner is guided to the mixing section [3], where it is mixed with air from the air pump [5].
 3. Toner mixed with air is conveyed to the air separation section [6] by the pressure from the toner pump [4].
 4. Toner conveyed to the air separation section drops off by its own weight to be separated from the air.
 5. Toner separated from the air at the air separation section is conveyed to the intermediate hopper [7] with the agitator operation.
 6. When the toner supply operation starts, toner in the intermediate hopper is conveyed to the developing unit [8] with the agitator operation.
 7. Finally, air passing through the air separation section is sent to the mixing section by the air pump.
- In this manner, a toner conveyance path is formed that circulates between the large capacity hopper and the developing unit.

1050to2038c

[1] Toner bottle	[2] Large capacity hopper
[3] Mixing section	[4] Toner pump
[5] Air pump	[6] Air separation section
[7] Intermediate hopper	[8] Developing unit

(3) Pump control

(a) Configuration

- In both the toner pump and the air pump, the toner pump motor (M28) or the air pump motor (M29) reciprocates the diaphragm [2] to circulate air in the pump room [3].
- In this manner, air in the pump room is pressurized to be output.

1050to2039c

[1] Motor	[2] Diaphragm
[3] Pump room	[4] Output air
[5] Input air	[6] Pump encoder sensor
[7] Encoder	-

(b) Control

Each pump motor is equipped with the pump encoder sensor to monitor the speed of the motor.

- When the pump motor is ON and the speed of the motor fails to get to 85% of the prescribed speed within a specified period of time, this speed is deemed to be an error.
- While in operation, if a low speed rotation below a prescribed value is detected a specified number of times in succession, this speed rotation is deemed to be an error.

7.3.2 Toner supply to the developing section

(1) Purpose

- Supply toner, in case toner supply is judged to be required as a result of the toner density control.
- It conducts the toner supply during printing at a prescribed time interval.
- It controls the time for toner supply in accordance with the condition detected by the TCR sensor (TCRS).

(2) Timing

- Toner is supplied when the trailing edge of paper in printing is detected.

- The toner supply time varies depending on the result of the toner density control and the paper size. This time is normally controlled between 0 to 0.55sec.

7.3.3 Toner remaining detection

(1) Toner remaining detection

- The intermediate hopper section [4] is equipped with the intermediate hopper toner remaining sensor (PS39) [5], and the large capacity hopper [3] is equipped with the hopper toner remaining sensor /1 (PS32) [2], /2 (PS33) [1]. Depending on the ON/OFF condition of each sensor, the toner level is displayed on the operation panel.

(a) Sensor position

[1]	Hopper toner remaining sensor /2 (PS33)	[2]	Hopper toner remaining sensor /1 (PS32)
[3]	Large capacity hopper	[4]	Intermediate hopper
[5]	Intermediate hopper toner remaining sensor (PS39)	-	

(b) Toner remaining display

操作部表示				
PS39	ON	ON	ON	OFF
PS32	ON	OFF	OFF	OFF
PS33	ON	ON	OFF	OFF

1050to2041c

*1 However, the determination is finally made a specified period of time after the toner supply door is closed.

(c) Error detection

- When the error SC-1-0 which is related to the toner supply occurs, the main body gets into an error latch condition. Be sure to repair the defective part before setting the software DIPSW 3-1 to 0.
- Setting the DIPSW3-1 to 0 without repairing defective parts causes toner to overflow inside and outside of the machine.

(2) Detection timing

(a) Timing

- The detection timing is as following:
- When the sub power switch (SW2) turns ON
 - When the front doors /Ft and /Rt, and the toner supply door are opened and closed.
 - At all times when the printing.

(b) Toner bottle

- When the toner bottle is rotated, toner moves to the exit of the bottle [1] along the spiral groove carved on the surface of the bottle.
- When the bottle exit turns to the bottom, toner flows into the large capacity hopper [2].

1050to2042c

8.2.3 Transfer belt pressure release drive

a0g6t2c061ca

[1]	Transfer belt pressure release motor (M26)	[2]	Cam
[3]	Pressure arm roller	-	

8.3 Operation

8.3.1 Transfer belt pressure position control

(1) OUTLINE

- There are 2 steps for the transfer belt pressure position: the pressure 1 and the pressure 2.
- Change the 2nd pressure position according to the paper types (paper type, paper weight) which is set for each tray.
- When the specified tray switches during printing for sheet insertion and so on, switch the pressure position to suitable one for paper types in each tray.
- The timing of switching is when the transfer belt turns OFF after transferring to the preceding paper.
- When switching the pressure position, the next paper stays at the registration section.
- When the switching of the pressure position completes, the paper through resumes.
- The rear nip roller position control is interlocked with the transfer belt pressure operation.

(2) Pressure mechanism

- The cam [2] of the transfer pressure unit [3] switches the pressure position of the transfer belt unit [11] between the pressure 1 [13] and the pressure 2 [12].
- The pressure power of the cam [2] is transmitted to the transfer belt unit [11] through the pressure arm [5], the pressure spring [4], the pressure plate and the pressure roller [6].
- Because of its shape, the cam [2] presses the pressure arm [5] up to the different height depending on the pressure position (pressure 1 [13] or pressure 2 [12]). Therefore the pressure to the transfer belt unit [11] also differs.
- The rear nip roller release lever /1 [7] can be moved at the pressure 2 position [12] to release the rear nip roller release lever /2 [8] and then the rear nip roller [9] comes down.

[1]	Pressure spring	[2]	Cam
[3]	Transfer pressure unit	[4]	Pressure plate
[5]	Pressure arm	[6]	Pressure roller
[7]	Rear nip roller release lever /1	[8]	Rear nip roller release lever /2
[9]	Rear nip roller	[10]	Transfer roller
[11]	Transfer belt unit	[12]	Pressure 2 position
[13]	Pressure 1 position	-	

(3) pressure position detection

- The pressure position of the transfer belt is controlled by the transfer pressure home sensor (PS54), the transfer pressure position sensor /1 (PS55) and /2 (PS56) which are mounted in the transfer pressure unit.

(4) Returning operation to the home position

- When the ADU handle release sensor (PS44) detects the /2-side print set and the door open/close sensor /1 (PS1) and /2 (PS2) turn ON, the transfer pressure home sensor (PS54) is checked. When it is OFF, the transfer belt pressure release motor (M26) turns ON and moves the pressure position to its home position.
- When PS54 is ON, M26 does not function.

(5) Pressure position table

g/m ²	40 to 49	50 to 61	62 to 74	75 to 91	92 to 135	136 to 162	163 to 216	217 to 244	245 to 300	301 to 350
Coat	Pressure 1	Pressure 1	Pressure 1	Pressure 1	Pressure 2	Pressure 2	Pressure 2	Pressure 2	Pressure 2	Pressure 2
PrePrinted	Pressure 1	Pressure 1	Pressure 1	Pressure 1	Pressure 1	Pressure 1	Pressure 2	Pressure 2	Pressure 2	Pressure 2
Fine	Pressure 1	Pressure 1	Pressure 1	Pressure 1	Pressure 1	Pressure 1	Pressure 2	Pressure 2	Pressure 2	Pressure 2

Inserting sheet (not printed)	Pressure 1	Pressure 1	Pressure 1	Pressure 1	Pressure 1	Pressure 1	Pressure 2	Pressure 2	Pressure 2	Pressure 2

8.3.2 Transfer/separation control**(1) Transfer belt bias control**

- It applies the DC bias on the transfer belt to enhance its transferability and to prevent dirt on it.
- The DC bias is applied from the transfer roller to the transfer belt.

(2) Bias control in image area

- For the image area (when the paper passes through the transfer nip), it applies the positive DC bias to enhance the transferability.
- The transfer bias switches at 4 points on the paper image area to divide the image area into 5. The divided 5 image areas independently control the transfer output power for each section.

Image area name: Lead 1, Lead 2, Lead 3, Center, Rear

(3) Bias control at the paper interval

- At the paper interval, It applies the negative DC bias to prevent the toner from adhering.

(4) Separating paper

- For discharging from paper, the saw-tooth electrode that is grounded via the specified resistance is installed at the separation position of the belt.

8.3.3 Transfer belt cleaning brush voltage apply control**(1) Purpose**

- It is equipped with the cleaning shaft to clean the toner collected with the cleaning brush.
- The 1st cleaning shaft [4] is positively-biased [5] to collect the toner which adheres to the transfer belt [7] via the 1st brush [6].
- Then, the 2nd cleaning shaft [3] is positively-biased [2] to collect the toner which adheres to the transfer belt [7] via the 2nd brush [1].
- In this manner, it collects the toner adheres to the transfer belt [7].

a0g6l2c056ca

[1]	2nd cleaning brush	[2]	Negative voltage
[3]	2nd cleaning shaft	[4]	1st cleaning shaft
[5]	Positive voltage	[6]	1st cleaning brush
[7]	Transfer belt	-	

(2) ON/OFF timing

- It turns ON/OFF in sync with ON/OFF of the transfer belt motor (M30).

9. TONER COLLECTION SECTION

9.1 Configuration

9.2 Drive

9.2.1 Waste toner box swing drive motor

9.2.2 Waste toner conveyance drive

[1] Torque limiter	[2] Drive gear for vertical conveyance screw
[3] Vertical conveyance drive shaft	[4] Waste toner motor (M9)
[5] Drive gear for horizontal conveyance screw	[6] Vertical conveyance screw
[7] Horizontal conveyance screw	[8] Waste toner full sensor /2 (PS62)

9.3 Operation

9.3.1 Waste toner conveyance path

- To maintain the image quality, it does not recycle the toner collected in the drum cleaning section [11] and the transfer belt cleaning section [12] but convey it to the waste toner box [4] to dispose.
- The toner collected in the drum cleaning section [11] is conveyed to the vertical conveyance section for drum cleaning [9] via the drum cleaner connection section [10].
- The toner collected in the transfer belt cleaning section [12] is conveyed directly to the vertical conveyance section for transfer belt cleaning [1].
- Each vertical conveyance section is connected to the horizontal conveyance section [6]. The toner is conveyed to waste toner box [4] through the horizontal conveyance section and the waste toner box connection section [2].
- Each conveyance pipe has the built-in screws. The waste toner motor (M9) [8] drives each screw excluding one of the drum cleaner connection section [10] for both vertical and horizontal conveyance operation.
- The drum motor (M2) drives the drum cleaner connection section [10].

[1] Vertical conveyance section for transfer belt cleaning	[2] Waste toner box connection section
[3] Left inside	[4] Waste toner box
[5] Rear side	[6] Horizontal conveyance section
[7] Right inside	[8] Waste toner motor (M9)
[9] Vertical conveyance section for drum cleaning	[10] Drum cleaner connection section
[11] Drum cleaning section	[12] Transfer belt cleaning section

9.3.2 Waste toner box swing control

(1) Purpose

- The swing mechanism is provided to flatten uniformly the toner collected into the waste toner box.

(2) Operation

- The waste toner box swing motor (M19) drives the swing pulley.
- There is a bearing that is installed near the periphery of the swing pulley.

- The waste toner box container is equipped with the cam plate. When the swing pulley rotates, the bearing rotates with the notch of the cam plate interlocked.
- In this manner, the waste toner box container which is stopped at the fixed position by the spring is pulled toward the swing pulley according to the shape of the notch of the cam plate.
- When the shaft passes the notch, the waste toner box container returns to the original position by the force of the spring.
- In this manner, it enables the waste toner box swing operation.

(3) Operation timing

- For 120 seconds when the drum motor (M2) turns ON after the morning correction.
- For 30 seconds at every 500 prints.
- For 120 seconds at every 10000 prints.

9.3.3 Waste toner box detection control

- The waste toner box set sensor (PS14) detects the setting condition of the waste toner box.
- When the PS14 is OFF, the print job is not conducted but it displays the warning message to set the waste toner box on the operation panel.

9.3.4 Waste toner box full detection control

- There are 2 steps for the waste toner box full detection control.

(1) 1st waste toner box full detection control

- The waste toner box is made of transparent material and there is a projection on it [2] for the waste toner full sensor /1 (PS37) [1].
- PS37 is a photo-interrupting type sensor. When the waste toner box is set on its position, the projection is inserted between the light-emitting part and the light-receiving part of PS37.
- As the waste toner box is transparent, the light from the light-emitting part normally reaches to the light-receiving part and it turns PS37 ON.
- When the toner collected in the waste toner box reaches to the projection, the light is interrupted by the toner and PS37 turns OFF.
- By this condition it detects that the toner amount in the waste toner box reaches a predetermined value.

[2]

[1]

(2) 2nd waste toner box full detection control

- The waste toner full sensor /2 (PS62) repeats turning ON/OFF according to the rotation of the screw in the waste toner conveyance pipe.
- By the PS62 sensor signal, it detects that the waste toner screw functions normally.
- When the printing continues after the waste toner full sensor /1 (PS37) detects the waste toner box full, the toner which is over the capacity of the waste toner box [1] accumulates in the waste toner box connection section [3].
- The conveyance pipe in the waste toner box connection section [3] has a torque limiter [2] installed on its screw section.
- When the accumulated toner weight applies specified level of load on the screw, the torque limiter [2] functions to prevent transmitting of the drive power of the waste toner motor (M9) to the screw in the waste toner box connection section.
- In this manner, the light blocking plate on the screw stops and the waste toner full sensor /2 (PS62) stops repetition of turning ON/OFF to indicate the waste toner full condition.

a0g6t2c029ca

10. CLEANING SECTION

10.1 Configuration

[1]	Blade motor (M22)	[2]	PCC unit
[3]	Weight plate	[4]	Cleaning blade

10.2 Drive

10.2.1 Cleaning blade drive

[1]	Trimmer blade motor (M22)	[2]	Blade release arm
-----	---------------------------	-----	-------------------

10.2.2 Toner guide brush drive

[1]	Cleaning blade drive shaft	[2]	Toner guide brush
[3]	Toner guide shaft	[4]	Separation claw oscillating drive gear
[5]	Toner conveyance screw	[6]	Drum cleaner motor (M35)
[7]	Drive coupling	-	

10.3 Operation

10.3.1 Cleaning operation

(1) Assist mechanism

- Toner scraped off by the cleaning blade [2] is collected by the toner guide brush [5]. Then it is scraped by the toner guide shaft [8] and guided to the toner conveyance screw [6].
- At this time, toner remaining on the toner guide shaft is scraped off by the toner collection scraper [7].
- The drum cleaner motor (M35) drives the toner guide brush, the toner guide shaft and the toner conveyance screw.

1050to2046d

[1]	Cleaning blade /2	[2]	Cleaning blade /1
[3]	Drum	[4]	PCC unit
[5]	Toner guide brush	[6]	Toner conveyance screw
[7]	Toner collection scraper	[8]	Toner guide shaft

(2) PCC unit

- The toner blush is equipped with the PCC unit on the upstream to improve the cleaning ability by weakening the toner adhesion to the drum.
- The high voltage unit /3 (HV3) supplies the power (DC) to the PCC and decreases the charged potential of the remaining toner which attaches to the drum surface.

(3) Automatic replacement of the blade

- The cleaning section is equipped with 2 cleaning blades.
- The 2nd cleaning blade pushes up the blade release arm [3] as the blade motor (M22) [1] rotates.
- At the time, the ratchet on the cleaning blade axis is released so that the charged spring is also released. Then the cleaning blade axis rotates to change the blade /1 to /2.
- Automatically changing 2 cleaning blades lengthens the maintenance cycle.

[1] Trimmer blade motor (M22)	[2] blade sensor /1 (PS24)
[3] Blade release arm	[4] blade sensor /2 (PS25)

(4) Blade pressure release operation

- To enhance the increased durability of the drum and the cleaning blade, the cleaning blade conducts the pressure release operation to the drum by the blade motor (M22).
- The M22 operates in accord with the ON/OFF of the drum motor (M2).
- The pressure release and the replacement position of the cleaning blade are controlled by the blade sensor /1 (PS24) and the blade sensor /2 (PS25).

(5) Blade setting mode

- As an operation conducted after replacing the cleaning blade for the maintenance purpose, there is the blade set mode in the service mode.
- Executing the blade set mode prevents the curling-up of the cleaning blade by cleaning the drum with the cleaning blade after letting toner adhere to the drum.

Note

- **Perform this process only after changing the cleaning blade. Otherwise, the cleaning blade special parts counter is reset, thus making it impossible to implement the auto blade change in the right timing.**

10.3.2 IMAGE STABILIZATION CONTROL**(1) Black band creation control**

- In order to provide lubrication of the cleaning blade while in the low printing ratio, and to prevent the deterioration of toner while in the increasing driving distance, the LPH is turned ON at prescribed intervals to create black band patterns on the drum.
- For details, refer to "[O.17. Image stabilization control.](#)"

(a) Execution timing

- 3 times every 5 prints

11. PAPER FEED SECTION

11.1 Configuration

1050to2300c

[1]	Paper empty sensor /1 (PS8), /2 (PS12)	[2]	Paper lift plate
[3]	Remaining paper VR /1 (VR1), remaining paper VR /2 (VR4)	[4]	CD paper size VR /1 (VR2), CD paper size VR /2 (VR5)
[5]	FD paper size VR /1 (VR3), FD paper size VR /2 (VR6)	[6]	Separation roller
[7]	Paper feed assist fans /Rr1 (FM20), /Rr2 (FM24)*1	[8]	Pick-up roller
[9]	Paper feed roller	[10]	Paper feed assist fans /Fr1 (FM21), /Fr2 (FM23)*1
[11]	Paper up/down assist mechanism	-	

*1 PRO 951 is unimplemented.

11.2 Drive

11.2.1 Paper feed drive

1050to2302c

[1]	Paper feed clutch /1 (CL4), /2 (CL6)	[2]	Coupling
-----	--------------------------------------	-----	----------

[3]	Separation clutch /1 (CL5), /2 (CL7) *1	[4]	Tray rear section
[5]	Tray central section	[6]	Torque limiter
[7]	Separation roller	[8]	Pick-up roller
[9]	Belt	[10]	Paper feed roller

*1 PRO 951 is unimplemented.

11.2.2 Tray lift drive

1050to2301c

[1]	Lift release coupling gear	[2]	Tray lift-up motor /1 (M25), /2 (M34)
[3]	Torque restriction gear (oil damper)*1	[4]	One-way clutch
[5]	Paper lift plate	[6]	Lift wires /Fr1, /Rr1
[7]	Lift wires /Fr2 and /Rr2	-	

*1 PRO 951 is unimplemented.

11.2.3 Pick-up drive

1050to2303c

[1]	Pick-up solenoid /1 (SD3), /2 (SD4)	[2]	Pick-up roller
-----	-------------------------------------	-----	----------------

11.3 Operation

11.3.1 Up/down control

(1) Up operation

- Tray lift-up motor /1 (M25), /2 (M34) take up the lift wires with the pulley and raise the paper lift plate.

(2) Down operation

- When pulling out the tray, the coupling gear [3] that transmits the drive force from the motor shaft [2] of the tray lift-up motor /1 (M25) and /2 (M34) to the pulley is disengaged by the release lever [1].
- The paper lift plate goes down slowly by its own weight through the torque restriction gear [4] that is activated only while in the down operation.*1

[1]	Release lever	[2]	Motor shaft of the tray lift-up motor /1 (M25) and /2 (M34)
[3]	Coupling gear	[4]	Torque restriction gear*1

*1 PRO 951 is unimplemented.

(3) Operation timing

- When the tray is set, the tray lift-up motor /1 (M25) and /2 (M34) turn ON to raise the paper lift plate.
- The M25 and M34 motors are stopped when the upper limit sensors /1 (PS6) and /2 (PS10) detect the uppermost status of the paper lift plate.
- When PS6/PS10 turn OFF from ON during the print operation, M25/M34 turn ON again. When the paper lift plate is raised until the PS6/PS10 turn ON, M25/M34 turn OFF again.

11.3.2 Paper size detection control

- The FD paper size VR /1 (VR3) and /2 (VR6) detect the paper size in the sub scan direction.
- The FD paper size VR is interlocked with the paper rear guide through the link wire.
- The CD paper size VR /1 (VR2) and /2 (VR5) detect the paper size in the sub scan direction.
- The CD paper size VR is interlocked directly with the paper guide.
- After a specified period of time since the tray is set to the main body, each VR informs the detected size data to the control program of the main body.
- For the resistance value of each VR, a default is set by "Tray Adjustment" in the service mode.
- For the paper sizes shown below, it is necessary to set the paper size on the operation panel.
 - Select A5 or $5\frac{1}{2} \times 8\frac{1}{2}$
 - Select $8\frac{1}{2} \times 14$, $8\frac{1}{2} \times 13$, $8\frac{1}{4} \times 13$, $8\frac{1}{8} \times 13\frac{1}{4}$ or 8×13
 - Select 12×18 or SRA3

[1]	Paper guide	[2]	Paper rear guide
[3]	FD paper size VR/1 (VR3) , /2 (VR6)	[4]	Link wire

[5]	CD paper size VR/1 (VR2), /2 (VR5)	-
-----	------------------------------------	---

11.3.3 Pick-up mechanism

- The pick-up solenoids /1 (SD3) and /2 (SD4) turn OFF to pick up the paper.
- When the SD3/SD4 turn OFF, the pick-up roller goes down and pressurizes paper by its own weight.
- When the paper feed clutches /1 (CL4) and /2 (CL6) turn ON, the pick-up roller rotates to convey the paper to the paper feed roller.

[1]	Start button ON	[2]	Pick-up of the 1st sheet of paper
[3]	Conveyance of the 1st sheet of paper	[4]	Pick-up of the 2nd sheet of paper
[5]	Conveyance of the 2nd sheet of paper		-

11.3.4 Separation mechanism

- For the transmission of the drive force to the separation roller [4], the drive force of the paper feed motor (M4) is transmitted by the ON/OFF operation of the separation clutches /1 (CL5) and /2 (CL7) [2] through the torque limiter [3].
- The separation roller [4] is driven in the direction opposite to the paper conveyance.
- When no paper is conveyed, and when only 1 sheet of paper is conveyed, the frictional force generating between the paper feed roller [1] and the separation roller [4] or the paper and the separation roller is greater than the frictional force of the torque limiter [3]. Accordingly, the separation roller rotates in the direction of the paper conveyance to convey paper to the vertical conveyance section.
- When 2 or more sheets of paper are conveyed, the frictional force between these sheets of paper is smaller than the frictional force of the torque limiter and the separation roller rotates in the reverse direction to prevent the lower most paper from being conveyed.

[1]	Paper feed roller	[2]	Separation clutch /1 (CL5), /2 (CL7) *1
[3]	Torque limiter	[4]	Separation roller
[5]	2nd sheet of paper	[6]	1st sheet of paper
[7]	Pick-up roller		-

*1 PRO 951 is unimplemented.

(1) Separation clutch control

- When paper is slippery (or, when the power for conveyance is insufficient), paper conveyed from the pick-up roller may be unable to pass through the handling sections of the paper feed roller and the separation roller.
- To alleviate this kind of condition, turn OFF the separation clutches /1 (CL5) and /2 (CL7) until paper gets to the handling section to cut off the drive force to the separation roller, and make it function as a driven roller to the paper feed roller. After paper gets to the handling section, turn ON the CL5 and CL7 and to conduct the normal handling operation.
- This control is made unconditionally for the 1st sheet of paper. For the 2nd and the succeeding sheets of paper, the control is made as follows.
 - Type of paper: Preprinted paper: Made unconditionally.
 - Type of paper: Other than Preprinted paper: Made automatically judging from the condition of conveyance at the handling section. *1

*1 For the paper type other than the coated paper, DIPSW39-0/1:1 conducts the control unconditionally. At this time, the control is made unconditionally for the coated paper only in the low temperature.

11.3.5 Air assist mechanism (1250/1250P/1052 only)

- The trays /1 and /2 are provided with the paper feed assist fan that assists the paper separation by blowing air [4] on paper [3] from the paper guides, 1 provided at front and rear.
- The tray /1 is provided with the paper feed assist fans /Fr1 (FM21) [2] and /Rr1 (FM20) [1] and tray /2 with paper feed assist fans /Fr2 (FM23) [2] and /Rr2 (FM24) [1].
- Each of the paper feed assist fans is effective especially for thick paper, and paper with a high degree of adhesion (such as coated paper). However, in the case of plain paper, it may not be fed smoothly.

1050to2309c

[1]	Paper feed assist fans /Rr1 (FM20) and / Rr2 (FM24)	[2]	Paper feed assist fans /Fr1(FM21) and /Fr2 (FM23)
[3]	Paper	[4]	Blow-out of air

(1) Operation timing

- The operation of the paper feed assist fans /Fr1 (FM21), /Rr1 (FM20), /Fr2 (FM23) and /Rr2 (FM24) can be selected from among the following 3 modes: Always ON, Always OFF and Auto.
- While in the Auto mode, the paper feed assist fan is normally turned OFF. However, when the coated paper or the preprinted paper is selected for the type of paper on the operation panel, the paper feed assist fan of the corresponding tray is turned ON.

11.3.6 Remaining paper detection control**(1) Paper empty detection**

- The paper empty sensors /1 (PS8) and /2 (PS12) carry out the paper empty detection in the tray.

(2) Remaining paper detection control

- The remaining paper detection is made by the remaining paper VR/1 (VR1) and /2 (VR3) [1] that are interlocked through the pulley [2] and the gear with the paper lift plate [4].
- The level of the paper remaining is detected in 4 steps according to the resistance value and sent to the main body after being AD converted.
- At this time, the following are displayed on the operation panel:
 - No Paper (↓ Flashing) : 0
 - 1st step (displayed in red): 13.3% or less
 - 1st step (displayed in white): 25% or less
 - 2nd step (displayed in white): 50% or less
 - 3rd step (displayed in white): 75% or less
 - 4th step (displayed in white): 76% or more

1050to2310c

[1]	Remaining paper VR/1 (VR1) and VR/2 (VR4)	[2]	Lift pulley /Rr
[3]	Paper lift plate	[4]	Lift wire

11.3.7 Tray lock control

- Each tray is locked by the tray lock lever.
- When the handle release sensors /1 (PS9) and /2 (PS13) of either of the tray /1 and /2 are OFF, the tray lock solenoids /1 (SD1) and /2 (SD2) of the corresponding tray turn on and the tray lock lever is pulled up to release the lock, thus allowing you to pull out the tray.
- If another OFF is detected while one of PS9 or PS13 is OFF, nothing but SD1 and SD2 which have already turned ON turns ON. This process is to prohibit 2 trays from being pulled out at the same time.
- When a jam that affects the tray and the exit conveyance section occurs, the tray remains being locked until the jammed paper is removed.
- Doing this prevents the paper from being torn.

11.3.8 Dehumidification heater control

- The tray /1 and the tray /2 are provided with the dehumidification heater /1 (HTR1) and /2 (HTR2), 1 each respectively, below each tray. They are turned on when the dehumidification heater switch (SW3) of the main body is turned ON.

11.4 Individual support

11.4.1 Corresponding to overlay printing (1250/1250P/1052 only)

- The following are available as the individual support parts for overlay printing.
 - Cleaning brush
 - Paper feed assist plate

(1) Cleaning brush

(a) Purpose

- When performing overlay printing (refer to [1.8.2.11 Overlay printing adjustment](#)) on coated paper on which offset printing has been made, the conveyance force of the pick-up roller and the paper feed roller is remarkably reduced by powder that is used to prevent the blocking (back transfer) during the offset printing, thus causing a no feed jam.
- The cleaning brush is a part used to remove this powder to realize the improved feedability of paper.
- The cleaning brush is attachable to the paper feed tray on the main body.
- The cleaning brush can clean the pick-up roller and the paper feed roller.
- Do not use the cleaning brush for the paper with many paper powders.
- If the cleaning brush is used in the manner described above, the paper powder clogs the cleaning brush and reduces the conveyance power.

(b) Configuration

- The package contains the following as a set.
 - [1] Brush main body: 1 pc.
 - [2] Positioning screw: 2 pcs.
 - [3] Screw: 2 pcs. (M3 x 6)
- Only 1 brush is packaged with this machine. When required additionally, brushes can be purchased as service parts.

1050to2311c

(2) Paper feed assist plate

(a) Purpose

- The paper feed assist plate is used to adjust the pick-up pressure on paper by changing the load on the pick-up roller.
- Adjustments can be made according to the type of paper to increase the paper feed performance.
- It is possible to improve a no feed condition that is apt to occur when a highly adhesive paper like thick paper or coated paper is fed.
- The paper feed assist plate weighs about 10g and up to 4 plates can be attached to 1 pick-up roller in normal condition (refer to [1.8.2.14 User setting of each paper brand](#)). When the surface of the cover paper is powdery, up to 3 plates can be attached (refer to [1.8.2.11 Overlay printing adjustment](#)).
- Increasing or decreasing the number of plates allows you to adjust the pick-up pressure corresponding to the type of paper.

(b) Configuration

- The package contains the following as a set.
 - [1] Paper feed assist plate: 4 pcs.
 - [2] Screw: 2 pcs. (M3 x 8)
- Only 4 paper feed assist plates are packaged together with the main body. When required additionally, can be purchased as service parts.

**11.4.2 Correspond to postcard**

- The following parts are available as the individual support parts for postcard.
 - Postcard kit

(1) Postcard kit**(a) Purpose**

- Since the available size for the paper feed on the tray of the main body is A5 size at minimum in standard, it cannot feed the postcard.
- Postcard kit is the adopter and is set as the service parts to make it enable to feed the postcard from the tray.
- The tray of the main body can keep about 600 sheets of postcard.

(b) Configuration

- Postcard kit bundles different length of regulation shafts but be sure to use the shorter one.
- The package contains the following as a set.
 - [1] Bottom plate: 1
 - [2] Upper plate /Fr, /Rr: 1 each (2 in total)
 - [3] Regulation shaft /L (not used): 2
 - [4] Regulation shaft /S: 2
 - [5] Screw: 6 pcs. (TP3 x 6)

1050to2313c

12. VERTICAL CONVEYANCE SECTION

12.1 Configuration

[1]	Paper dust guide brush	[2]	Conveyance exit roller
[3]	Conveyance roller /1	[4]	Pre-registration roller /1
[5]	Conveyance roller /2	[6]	Conveyance roller /3
[7]	Pre-registration roller /2	[8]	Torque limiter

12.2 Drive

[1]	Conveyance roller /1	[2]	Scraper shaft
[3]	Pre-registration roller /2	[4]	Conveyance roller /3
[5]	Conveyance roller /2	[6]	Pre-registration clutch /2 (CL3)
[7]	Coupling (transmission of driving force to the tray /2)	[8]	Torque limiter
[9]	Vertical conveyance clutch (CL2)	[10]	Paper feed motor (M4)
[11]	Coupling (transmission of driving force to the tray /1)	[12]	Pre-registration clutch /1 (CL1)
[13]	Vertical conveyance motor (M8)	[14]	Conveyance exit roller
[15]	Pre-registration roller /1	[16]	Paper dust guide brush

12.3 Operation

12.3.1 Pre-registration control

- When the paper feed starts, paper is sent out to the pre-registration roller by the pick-up roller and the paper feed roller.
- When the paper strikes the pre-registration roller that is stopped, a loop is formed to adjust paper skew.
- When the pre-registration clutches /1 (CL1) and /2 (CL3) turn on, the driving force of the paper feed motor (M4) is transmitted to the pre-registration rollers /1 and /2 to convey paper.

12.3.2 Conveyance control

- Paper fed from the tray /1 is conveyed to the conveyance roller /1 which is also driven by the vertical conveyance motor (M8) by the pre-registration roller /1.
- Paper fed from the tray /2 is conveyed to the conveyance rollers /3 and /2, which are in turn driven by the pre-registration roller /2 and the paper feed motor (M4) through the vertical conveyance clutch (CL2), and then conveyed finally to the conveyance roller /1.
- Since the line speeds of the pre-registration rollers /1 and /2 and the conveyance rollers /3 and /2 that are driven by the M4 are fixed at a high speed, the pre-registration clutches /1 (CL1) and /2 (CL3), and the CL2, while in the transfer/conveyance in a low speed, are turned off to cut off the transmission of the driving force.
- At this time, the conveyance roller /1 driven by the M8 rotates at a low speed. However, it starts to rotate in a high speed when the loop sensor (PS16) detects the trailing edge of paper.

12.3.3 Exit conveyance control

- For the exit conveyance, the vertical conveyance motor (M8) drives the conveyance exit roller and conveyance roller /1.

12.3.4 Paper dust removing mechanism

- At the exit of the vertical conveyance section, paper dust is removed with the paper dust guide brush.
- When paper dust adhering to the conveyance exit roller is removed by the paper dust guide brush (raising brush), it then adheres to the scraper shaft (metal roller) to be removed by the scraper (sheet) that touches the scraper shaft.

13. REGISTRATION SECTION

13.1 Configuration

[1] Paper skew sensor /Rr (PS66)*1	[2] ADU deceleration sensor (PS42)
[3] Multi-feed detection board /R (MFDBR)*1	[4] Loop motor (M18)
[5] Loop roller	[6] Registration roller
[7] Registration motor (M17)	[8] Paper leading edge sensor (PS41)
[9] Registration sensor (PS40)	[10] Multi-feed detection board /S (MFDBS)*1
[11] Centering sensor (PS4)	[12] Paper skew sensor /Fr (PS65) *1

*1 PRO 951 is unimplemented.

13.2 Drive

(1) Registration roller drive

[1] Registration roller /Up	[2] Registration roller /Lw
[3] Registration motor (M17)	-

(2) Loop roller drive

[1] Loop motor (M18)	[2] Loop roller
----------------------	-----------------

13.3 Operation

13.3.1 Multi feed detection control (1250/1250P/1052 only)

- To detect the multi feed of paper while in the paper conveyance, the multi feed sensor is provided at the exit of the loop roller.
- The multi feed sensor is an acoustic sensor made up of a pair of a sender and a receiver.
- In the multi feed sensor, the multi-feed detection board /R (MFDBR) receives the ultrasonic sent from the multi-feed detection board /S (MFDBS).
- When a single sheet of paper passes between MFDBS and MFDBR, it is possible to receive a sound wave, but when plural sheets of paper pass through, it is not possible to receive sound waves.
- In this way, a detection is made to check to see if paper is multi fed.
- The multi feed detection is guaranteed for paper that is 160mm or longer in the main scan direction.

13.3.2 Loop control

- When paper conveyed to the loop roller [1] strikes the registration rollers /Up [4] and /Lw [2] which rotate in the reverse direction, a loop [6] is formed before the loop roller turns OFF.
- In this way, a paper skew is adjusted.
- When paper is heavier than 163g/m^2 , it has a stronger repulsive force and occurs a transfer jitter due to the increased partial line speed caused by the force by which the loop tends to go back to its original form. Therefore, it is controlled so that the loop amount becomes smaller than the amount of the paper of 162g/m^2 .
- When paper is 49g/m^2 or lighter, it has a weaker repulsive force. It has a possibility of creating a loop too much or not creating a loop at all. Therefore, it is controlled so that the loop amount becomes smaller.
- The registration roller stops rotating in the reverse direction and then it rotates in the forward direction to stop its motion.

(1) Registration path

[3]	Paper leading edge sensor (PS41)	[4]	Registration roller /Up
[5]	Registration sensor (PS40)	[6]	Loop
[7]	ADU deceleration sensor (PS42)	-	

(2) Registration operation

a0g6l2e075ca

[1]	Start button ON	[2]	Loop creation
[3]	Registration starts	-	

13.3.3 Paper centering correction control

- To detect the centering of paper after registration, the centering sensor (PS4) is provided at the exit of the registration roller.
- The PS4 is a contact image sensor of about 200dpi and the centering information detected by the PS4 is processed at the image-processing section and adjusted during writing so that the image data corresponds to the position.
- The centering amount can be adjusted up to $\pm 5\text{mm}$.
- When the centering amount is in excess of 5mm, the paper is output with same correction condition as the preceding output from that tray applies.

13.3.4 Paper leading edge timing adjustment control

- To detect the paper leading edge timing after registration, the paper leading edge sensor (PS41) is provided at the exit of the registration roller.
- Based on the paper leading edge position detected by the PS41, adjustments are made during writing so that the image data corresponds to the position.

13.3.5 Paper skew detection control (1250/1250P/1052 only)

- To detect the centering of paper after registration, the paper skew sensor /Fr (PS65) and /Rr (PS66) are provided.
- It detects the time when the paper passes PS65 and PS66 and determines the paper skew amount according to the time difference. When the amount is excess of the paper skew amount detection threshold (set from the touch panel), the man body gets into JAM and stops.
- Paper skew detection control does not function for the paper under 130mm or less as the length in the main scan direction.

14. FUSING SECTION

[11]	Flywheel	[12]	Web drive coupling
[13]	Web wind-up shaft	-	

14.2.2 Fusing roller /Lw pressure drive (1250/1250P/1052 only)

a0g6t2c072ca

[1] Fusing pressure release motor (M33)	[2] Pressure roller
[3] Pressure cam	[4] Pressure arm
[5] Fusing roller /Lw	[6] Fusing roller /Up

14.3 Operation

14.3.1 Fusing roller drive control

(1) Speed changeover control

- According to the relationship between the type of paper and the paper weight, the process speed is controlled with 3 steps or 2 steps.

Machine type	High speed	Medium speed	Low speed
1250/1250P	570mm/s	490mm/s	330mm/s
1052	490mm/s	-	330mm/s
PRO 951	460mm/s	-	290mm/s

(2) Preparative rotation control

(a) Control when the power is turned ON

- When the fusing temperature is less than 50°C with the sub power switch (SW2) turned ON and the detection temperature of the fusing temperature sensor /1 (TH1) of the fusing roller /Up gets to a specified temperature, the fusing motor (M1) starts the preparatory rotation and stops after a specified period of time or when the TH1 detects a specified temperature.
- When the fusing temperature is between 50°C or more and less than 185°C with the SW2 turned ON or while in the warm-up after cleaning jam and the detection temperature of the TH1 of the fusing roller /Up gets to a specified temperature, the M1 starts the preparatory rotation. Then, the M1 stops after a specified period of time or when the TH1 detects a specified temperature.
- The software DIPSW8-2/3 allows you to make a selection between the execution and the non-execution of this preparatory rotation. Also the software DIPSW8-4/5 allows you to change the length of the preparatory rotation time.

(b) Print control

- It conducts the preparatory rotation for a specified period of time before the printing starts.
- The length of the preparatory rotation time is previously specified in accordance with the type of paper and the paper weight.
- It does not conduct the preparatory rotation when the next printing starts within 3 seconds after the previous printing.

(c) Control after the small-size paper printing

- The preparatory rotation time for the next printing differs from the normal time when printing 100 or more sheets continuously on the paper with appropriate width, and the next printing starts within 240 seconds using either type of paper (must be wider than the paper used in the preceding job); weight 91g/m² or less, paper size A3, B4 or 11 x 17.
- The paper width as an object to perform the preparatory rotation varies depending on models.

Machine type	Paper width
1250/1250P/1052	Less than 279.4mm (11in.)
PRO 951	216mm (8.5in.) or less

- This preparatory rotation time differs according to the idling time.
- Either of longer one is applied; this arranged preparatory rotation time or the normal preparatory rotation time.
- The software DIPSW 8-7 allows you to make a selection between the execution and the non-execution of this preparatory rotation.

(d) Control while in idling (1250/1250P/1052 only)

- The M1 stops while in idling, however, it conducts the preparatory rotation when the prescribed condition is met.
- The preparatory rotation is conducted for a specified period of time when the TH1 detects 230°C or more while in idling.
- When a print is reserved while in idling, the preparatory rotation is not conducted. Even when the TH1 detects 230°C or more.
- When a print is executed during the preparatory rotation while in idling, the preparatory rotation is stopped to print.

(e) Control while in idling P

- The M1 stops while in idling, however, it conducts the preparatory rotation when the prescribed condition is met.
- The preparatory rotation is conducted for a specified period of time when the fusing temperature sensor /2 (TH2) detects 220°C or more.
- When a print is reserved while in idling, the preparatory rotation is not conducted even when the TH2 detects 220°C or more.
- When a print is executed during the preparatory rotation while in idling, the preparatory rotation is stopped to print.

(3) Main motor control when left unused (PRO951 only)

- To avoid the condition that the fusing roller /Up contacts with the fusing roller /Lw for long time, if the main motor is idling or in the sleep mode when 6 hours has passed since the rollers are left unused, rotates the fusing motor (M3) at low process speed for a specified period of time.
- The count value of the left unused time is the stopping time of the drum motor (M1).
- When the drum rotates to print or to correct processes, the count value of the left unused time is reset.
- Also when the sub power switch (SW2) is turned OFF or the auto shut-off mode is entered, the count value of the left unused time is reset.
- Do not perform this control if the front door is open or the maintenance mode is activated, when the count value of the left unused time becomes 6 hours.
- When a print is executed while in performing this control, the preparatory rotation is stopped for the print.

(4) Speed stabilization

- To stabilize the speed, the gear shaft between the M1 and the fusing roller /Up is equipped with a flywheel. The inertia force of the flywheel stabilizes the speed of the fusing roller to minimize the transfer jitter on thick paper.

14.3.2 Pressure release drive control (1250/1250P/1052 only)**(1) Purpose**

- The pressure release control of the fusing roller /Lw enhances the following performance.
 - Enhancement of the durability of the fusing roller /Up and /Lw.
 - Reducing the curl amount and enhancement of fusibility in printing.
 - Warming up of the fusing roller /Lw in the warm-up preparatory rotation.
 - Improvement of the productivity and the durability of the pressure release mechanism.

(2) Operation**(a) Pressure position**

- The pressure position has five positions from position1 to 5.
- Pressure position 1 "Very strong" can be set to be used in software DIPSW setting, however it is not usually used.
- The pressure positions differ depending on the paper type and weight, the speed, and the environment for each 1250/1250P and 1052.

Pressure position	Position 1	Position 2	Position 3	Position 4	Position 5
Pressure power	Very strong	Strong	Medium	Weak	Weak

(b) During the preparatory rotation in warming-up

- The pressure position switches to the position3. The pressure position switches to the position 5 after the pre-rotation.

(c) When starting the printing

- The pressure position switches to the position in accordance with the paper type at the same time the preparatory rotation for the printing starts.

(d) While in the print

- The pressure position changes for each paper type.
- After the print completes, it keeps the current pressure position for the next print. When there is no next job input, the pressure position switches to the position 5.
- When the pressure position for the next print differs from the previous one, the pressure position switches when the preparatory rotation for the next print starts.

(e) Tray individual setting

- By the tray individual setting (process setting), it is possible to make the individual settings for each tray.

(f) Switching of the pressure position

- For each 1250/1250P and 1052, there is no regulation and the position switches to either of the position 2 to 5.
- When position 1 is set to be used by the software DIPSW, the position switched to either of the position 1 to 5.

(g) Improvement of the fusibility at the starting of printing.

- At the starting of printing, the pressure position can be temporary boosted to 1 step upper level from the prescribed position to enhance the fusibility.
- The software DIPSW 19-5 enables to make a selection between the execution and the non-execution of this control.

14.3.3 Web drive control

- Web motor (M24) rotation time is controlled according to the paper size, coverage, environment and web count to maintain the web movement value per one print.
- The software DIPSW changes the control of the web movement value.

14.3.4 Separation claw oscillating mechanism

- The fusing claw oscillating mechanism is provided to avoid damaging the fusing roller /Up [2] with the fusing claw /Up.
- The drive shaft [4] of the fusing claw unit [3] is engaged with the holder [1] to which the drive force of the web motor (M24) is transmitted via the fusing claw /Up oscillating drive gear [5].
- This process allows the fusing claw unit to shake in synchronization with the motor drive.

[1]	Holder	[2]	Fusing roller /Up
[3]	Separation claw unit	[4]	Drive shaft
[5]	Fusing claw /Up oscillating drive gear	-	

14.3.5 Fusing temperature control

- The heating of the fusing roller /Up is made by the fusing heater lamps /1 (L1) and /2 (L2) and the heating of the fusing roller /Lw made by the fusing heater lamp /3 (L3) through the fusing heating roller.
- The surface temperature of the fusing roller /Up is detected at fixed intervals by thermistor /1 (TH1) [1] provided at the center, and controlled by turning L1 and L2 ON/OFF through the AC drive board (ACDB) so that it becomes a prescribed temperature.
- The surface temperature of the fusing heating roller is detected at fixed intervals by fusing temperature sensor /3 (TH3) [2] provided at the center and the temperature of the fusing heating roller is controlled by turning L3 ON/OFF via ACDB.

a0g6t2c038ca

[1]	Fusing temperature sensor /1 (TH1)	[2]	Fusing temperature sensor /3 (TH3)
-----	------------------------------------	-----	------------------------------------

(1) Warm-up

- The fusing heater lamps /1 (L1), /2 (L2) and /3 (L3) turn ON while in the warm-up, and they turn OFF at a prescribed temperature.

(2) While in the print

(a) 1250/1250P/1052

- For the fusing roller /Up, the temperature setting varies according to the type of paper, paper weight, environment and time elapsed after starting print. The fusing heater lamp /1 (L1) and /2 (L2) is turned ON/OFF so that the temperature comes to a prescribed temperature.
- ON/OFF controls of L1 and L2 vary depending on the process speed.
- For the fusing roller, the temperature setting varies according to the type of paper and the paper weight. The fusing heater lamp /3 (L3) is turned ON/OFF so that the temperature comes to a prescribed temperature.

(b) PRO 951

- For the fusing roller /Up, the temperature setting varies according to the type of paper and the paper weight. The fusing heater lamp /1 (L1) and /2 (L2) is turned ON/OFF so that the temperature comes to a prescribed temperature.
- For the fusing roller, the temperature setting varies according to the type of paper and the paper weight. The fusing heater lamp /3 (L3) is turned ON/OFF so that the temperature comes to a prescribed temperature.

(3) Non-paper through section temperature control (1250/1250P/1052 only)

- To prevent the temperature of the non-paper through section of the fusing roller /Up from raising, decrease the set temperature by the prescribed value while in the print when the edge temperature of the fusing roller /Up exceeds a prescribed value.
- After decreasing the set temperature, monitor the edge temperature of the fusing roller /Up when the fusing heater lamp /1 (L1) turns OFF/ON. Then, increase or decrease the set temperature while in the print by a prescribed value depending on detected temperature.

(4) Alarm control

- To prevent the fusing under, stop the printing and conduct the warm-up when the fusing roller /Up detects a prescribed temperature while in the print.
- When the warm-up is completed, the printing is restarted automatically.

(5) While in standby

- The fusing roller /Up is heated by the fusing heater lamp /1 (L1) when the temperature is 3°C lower than a prescribed temperature and turns OFF L1 when it reaches 2°C higher than a prescribed value.
- The fusing heating roller is heated by the fusing heater lamp /3 (L3) when the temperature is 1°C lower than a set temperature, and lamp /3 (L3) turns OFF when the temperature is 1°C higher than a set value.
- The heater lamp /2 (L2) is for flicker and does not turn ON.

(6) Control for improvement of the fusibility at the starting of printing.(1250/1250P/1052 only)

- The printing starts after the specified period of time after the start button is pressed on the condition that the temperature of the fusing roller /Up is higher than the prescribed temperature.
- When the detected temperature is lower than the prescribed value, it conducts warming-up until the temperature reaches the prescribed value.
- The software DIPSW36-2 can change the condition for conducting this control.

(7) Temperature down/up control (PRO 951 only)

- When the start button is pressed while the prescribed difference in temperature occurs between the detected temperature of the fusing roller /Up and the set temperature which is set depending on type of paper and weight, perform the temperature down or up control. Then, start printing when the difference in temperature meets a prescribed value.

(a) Temperature down control

- For the paper whose weight is 91g/m^2 , conduct this control when the detected temperature of the fusing roller /Up is higher than the set temperature by a prescribed temperature.
- Turns ON the fusing motor (M3) and rotates the fusing roller /Up, /Lw until the detected temperature of the fusing roller /Up becomes 6°C lower than a prescribed temperature.
- Do not conduct when the sheet insertion is selected.
- The software DIPSW enables to make a selection between the execution and the non-execution of this control.

(b) Temperature up control

- For all weight of paper, conduct this control when the detected temperature of the fusing roller /Up is lower than the set temperature by a prescribed temperature.
- Turns ON the fusing heater lamp /1 (L1), /2 (L2), /3 (L3), and heats the fusing roller /Up, /Lw until the detected temperature of the fusing roller /Up becomes -6°C higher than a prescribed temperature.

(8) Preparatory rotation after printing

- It conducts the preparatory rotation for 10 seconds when the temperature of the fusing roller /Up reaches the prescribed value while in idling.
- After printing, turns OFF the fusing heater lamp /1 (L1), /2 (L2) forcefully.
- When there is a print reservation, this control does not function but the printing operation takes priority.
- Also when the next print job is inputted while conducting this control, the printing operation takes priority.

(9) Power save

- The timer starts to count when the last printing completes. When the operation button is not pressed within a specified period of time, the mode switches to the low-power mode or the shut-off mode.
- The length of time which elapses before switching to the low-power mode or the shut-off mode can be specified arbitrarily.
- When the setting time of the low-power mode and the shut-off mode coincides, the shut-off mode is selected.

(a) Low-power mode

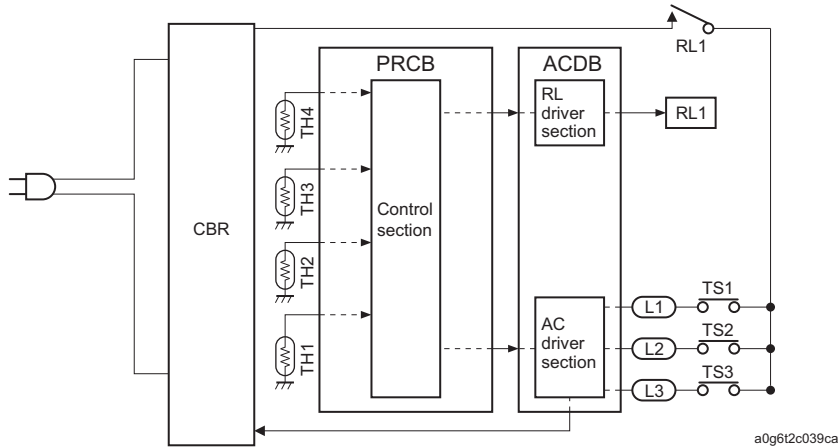

- The fusing roller /Up controls ON/OFF of the fusing heater lamp /1 (L1) to a prescribed temperature.
- The fusing heating roller controls ON/OFF of the fusing heater lamp /3 (L3) to a prescribed temperature.
- The heater lamp /2 (L2) is for flicker and does not turn ON.

(b) Shut-OFF mode

- When switching to the shut-off mode, the energization to the fusing heater lamp /1 (L1), /2 (L2) and /3 (L3) turns OFF.

14.3.6 Protection against temperature abnormality

- When the fusing temperature sensor /1 (TH1) detects a prescribed temperature (244°C or more) 10 times at a specified intervals, or the fusing temperature sensor /2 (TH2) detects a prescribed temperature (249°C or more), a message is displayed on the operation panel. The fusing heater lamps /1 (L1), /2 (L2) and /3 (L3) turn OFF and the operations stop.
- Thermostats /1 (TS1) and /2 (TS2) also monitor an abnormal temperature rise. TS1 and TS2 cut off the fusing heater lamps /1 (L1) and /2 (L2) at a prescribed temperature.
- When the fusing temperature sensor /3 (TH3) detects a prescribed temperature (220°C or more) 5 times at a specified intervals, or the fusing temperature sensor /4 (TH4) detects a prescribed temperature (240°C or more), a message is displayed on the operation panel. The fusing heater lamps /1 (L1), /2 (L2) and /3 (L3) turn OFF and the operations stop.
- Thermostat /3 (TS3) also monitors an abnormal temperature rise. TS3 cuts off the fusing heater lamp /3 (L3) at a prescribed temperature.
- When TH1/TH3 do not reach a prescribed temperature a specified period of time after the main power switch (SW1) turns ON and the temperature of the roller become normal again, L1/L2/L3 turn OFF and the operation stop.
- When those fusing temperature abnormalities occur, the system gets into an SC latch condition. So, after identifying the cause of the error and repairing it, it is necessary to make the release and recovery operations with the software DIPSW 3-1.

15. DUPLEX SECTION

[7] ADU reversal roller	[8] ADU reverse motor (M12)
[9] ADU conveyance motor /2 (M16)	[10] Loop motor (M18)

15.3 Operation

15.3.1 Conveyance control

(1) ADU paper feed mechanism

- Paper conveyed from the reversal output section is conveyed to the duplex reverse section by the reversal output roller [3] and the ADU reverse roller [4].
- When the reverse sensor /2 (PS47) [4] detects the trailing edge of paper and turns OFF, the ADU reverse roller rotates in the reverse direction to send paper back in the direction in which it was conveyed.
- At this time, the paper is conveyed to the ADU conveyance roller /1 [1] side, not to the reverse/exit roller side, according to the form of the metal frame of the conveyance path.

[1]	ADU conveyance roller /1	[2]	ADU reversed paper
[3]	Reversal output roller	[4]	Reverse sensor /2 (PS47)
[5]	ADU reversal roller	[6]	ADU reverse sensor /2 (PS45)
[7]	ADU feed paper	-	

15.3.2 Duplex circulation control

(1) OUTLINE

- The length of the conveyance path in the duplex section including the registration section is kept at the enough length to circular the 3 sheets of paper, regardless of the paper size.
- When in duplex printing, it is controlled so that 3 sheets of paper always circular in these conveyance paths.
- There are 3 paper stop points in the paper circulation.
- The 3 points are; the registration sensor (PS40), ADU reverse sensor /2 (PS45) and the ADU exit sensor (PS43).

[1]	Loop roller	[2]	ADU exit roller
[3]	ADU exit sensor (PS43)	[4]	ADU conveyance roller /4

[7]	ADU conveyance roller /1	[8]	ADU reversal roller
[9]	ADU reverse sensor /2 (PS45)	[10]	Registration roller
[11]	Registration sensor (PS40)	-	

(2) Paper conveyance control

(a) The registration starting up for the front side of the 1st sheet of paper

- When the registration sensor (PS40) turns ON for the 1st sheet of paper, the registration roller rotates to register the front side of the 1st paper after the loop formed.

[1]	Front of the 1st sheet of original (1st page)	-
-----	---	---

(b) The registration starting up for the front side of the 2nd sheet of paper

- A specified period of time after the registration of the front side of the 1st sheet of paper, the 2nd sheet of paper is fed. Another specified period of time after, it conducts the registration of the front side of the 2nd sheet of paper.

[1]	Front of the 2nd sheet of original (3rd page)	[2]	Front of the 1st sheet of original (1st page)
-----	---	-----	---

(c) The registration starting up for the front side of the 3rd sheet of paper

- A specified period of time after the registration of the front side of the 2nd sheet of paper, the 3rd sheet of paper is fed.
- When the trailing edge of the 1st sheet of paper with its front side printed passes the reverse sensor /2 (PS47), the ADU reversal roller rotates in the reverse direction to feed the 1st sheet toward the ADU conveyance roller /1 after the specified time.
- This operation turns the paper from front side to the back side.
- When the leading edge of the 1st sheet of paper turns ON the ADU exit sensor (PS43), the ADU conveyance roller /4 stops and enters the stand-by.
- At this time, the registration is conducted on the front side of the 3rd sheet of paper which already stands by at the registration section.
- When the trailing edge of the 2nd sheet of paper with its front side printed passes PS47, the ADU reverse roller stops after the specified time.

[1]	Front of the 1st sheet (reversed)	[2]	Front of the 2nd sheet of original (3rd page)

(n) The registration starting up for the back side of the 4th sheet of paper

- When PS40 turns ON for the 4th sheet of paper, the registration roller rotates to register the back side of the 4th sheet of paper after the loop formed.

(o) **Starting up of the 5th sheet of paper from the ADU conveyance roller /4 stop point
3rd paper exit**

- A specified period of time after the registration of the back side of the 4th sheet of paper, the 5th sheet of paper stopping at the ADU conveyance roller /5 starts up.
- The 3rd sheet of paper with its back side printed is conveyed to a post-process option through the paper exit section.

[1]	Front of the 5th sheet of original (being reversed)	[2]	Back of the 3rd sheet (both side printed)
[3]	Back of the 4th sheet of original (8th page)	-	

(p) The registration starting up for the back side of the 5th sheet of paper
4th paper exit

- When PS40 turns ON for the 5th sheet of paper, the registration roller rotates to register the back side of the 5th sheet of paper after the loop formed.
- The 4th sheet of paper with its back side printed is conveyed to a post-process option through the paper exit section.

(q) 5th paper exit

- The 5th sheet of paper is conveyed to a post-process option through the paper exit section.
- When printing more than 5 sheets continuously, it repeats steps (i) to (n).

16. REVERSE/EXIT SECTION

16.1 Configuration

[1] ADU accelerate sensor (PS49)	[2] Output convey roller /2
[3] ADU accelerator roller	[4] Reversal output roller
[5] Reverse sensor /2 (PS47)	[6] Reverse sensor /1 (PS48)
[7] Output convey roller /1	[8] ADU reverse paper exit sensor (PS50)
[9] Decurler entrance roller	[10] De-curler belt /Lw*1
[11] Paper exit sensor (PS3)	[12] De-curler belt /Up
[13] De-curler entrance sensor (PS23)	[14] Reverse gate
[15] Fixing exit roller	-

*1 PRO 951 is unimplemented.

16.2 Drive

a0g6t2c043ca

[1] Reverse/exit motor (M13)	[2] Reversal output roller
[3] ADU accelerator roller	[4] Output convey roller /1
[5] Paper exit conveyance motor (M31)	[6] Output convey roller /2
[7] ADU accelerate motor (M14)	[8] Paper exit motor (M20)
[9] Decurler entrance roller	[10] Fixing exit roller
[11] Gear for the fusing roller /Up	-

16.3 Operation

16.3.1 Conveyance control

(1) Reverse gate

- The reverse gate is turned ON/OFF by the reverse/exit solenoid (SD7) and switches the conveyance path for paper exited from the fusing section over to either the straight paper exit or the reverse paper exit/ADU paper feed.

(2) Conveyance path

(a) Straight paper exit

- While in the straight paper exit, the reverse gate is closed when the reverse/exit solenoid (SD7) turns ON. The paper exited from the fusing exit roller [1] is conveyed to the de-curler roller [3] passing over the reverse gate [2].

1050to2064

[1]	Fixing exit roller	[2]	Reverse gate
[3]	De-curler entrance roller		-

(b) Reverse paper exit

- When in the reverse paper exit and the ADU paper feed, the reverse gate [6] is opened when the reverse/exit solenoid (SD7) is OFF, and paper is conveyed to the ADU acceleration roller [8].
- The paper that passed through the ADU acceleration roller is conveyed to the reverse/exit roller [10] according to the shape of the metal frame.
- The reverse/exit roller, when the reverse sensor /1 (PS48) [9] detects the trailing edge of paper turns OFF, and then rotates in reverse to get the paper back in the original direction.
- While in the ADU paper feed, paper is conveyed to the ADU paper feed section passing through the reverse/exit roller.
- Paper sent back by the reverse/exit roller is conveyed to the paper exit roller /1 [3], not to the ADU acceleration roller along the form of the metal frame.
- In this way, the paper is turned over to be conveyed to the de-curler roller [5] through the paper exit roller /2 [4].
- While paper is being conveyed to this paper exit roller, the reverse/exit sensor /2 [11] detects the trailing edge of paper to determine a timing to switch the rotating direction of the paper exit roller to the introducing direction.

1050to2065

[7]	Fixing exit roller	[8]	ADU accelerator roller
[9]	Reverse sensor /1 (PS48)	[10]	Reversal output roller
[11]	Reverse sensor /2 (PS47)		-

16.3.2 Decurler switching control**(1) In case of 1250/1250P/1052**

- The de-curler mechanism is provided for correction of the paper curl.
- The de-curler section is provided with the guide members /Up [7] and /Lw [3]. The de-curler solenoids /Up (SD8) [5] and /Lw (SD5) [2] turn ON/OFF the corresponding guide member.
- When either of the solenoids turns ON, the corresponding guide member turns ON to guide the paper which is conveyed from the de-curler entrance roller [1] so that the paper passes through either the de-curler belt /Up [6] or /Lw [4].
- At this time, the paper curl is corrected by belt stroking action.
- The correcting directions of the de-curler belt /Up [6] and /Lw [4] are 180° opposite.
- The de-curler roller /Up or /Lw can be selected from the operation panel and the straight exit is also selectable.
- The paper weight 244g/m² or less paper is available for the de-curler.
- Even though selecting the de-curler setting for the 245g/m² paper from the operation panel, the paper is automatically processed with the straight exit.

a0g6t2c044ca

[1] De-curler entrance roller	[2] De-curler solenoid /Lw (SD5)
[3] Guide member /Lw	[4] De-curler belt /Lw
[5] De-curler solenoid /Up	[6] De-curler belt /Up
[7] Guide member /Up	-

(2) In case of PRO 951

- The de-curler mechanism is provided for correcting the paper curl.
- The de-curler section is provided with the guide member /Up, and the de-curler solenoid /Up (SD8) turns it ON/OFF.
- When SD8 turns ON, the guide member /Up guides the paper which is conveyed from the de-curler entrance roller so that the paper passes through the de-curler belt /Up.
- At this time, the belt stroking action corrects the paper curl.
- Others are the same as 1250/1250P/1052.

17. IMAGE STABILIZATION CONTROL

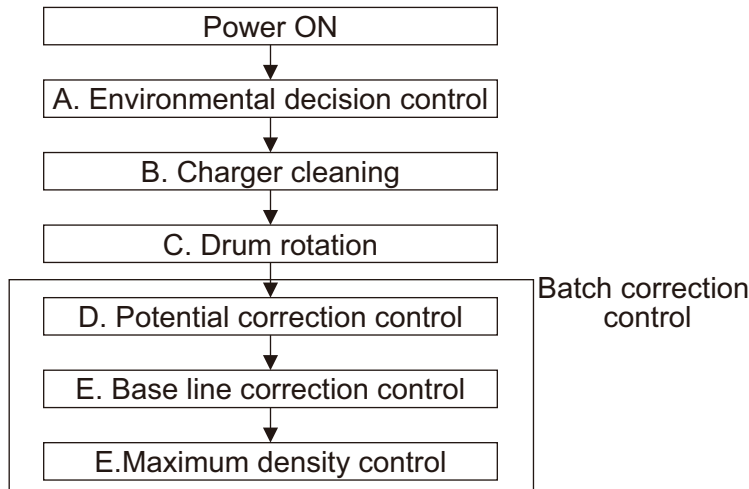

17.1 OUTLINE

- In order to realize the top quality print images at all times, this machine conducts various types of control for image stabilization.
- The operation of the image stabilization control varies according to the power switch (SW2) being turned ON or the print being in operation.

17.2 Operation flow

17.2.1 Image stabilization control flow when the power switch (SW2) is ON

- The following shows the flow of the operation of the image stabilization control when the power switch (SW2) turns ON.

(1) Environmental decision control

(a) Purpose

- To detect the ambient temperature and humidity and feed back the findings to the various types of controls to maintain the image at a fixed quality.
- Also it detects the environmental temperature and humidity in real time to adjust accordingly the environmental changes which occurs after the sub power switch (SW2) turns ON.

(b) Method

- The drum temperature sensor (TH5), the temperature sensor (TEM), the temperature-humidity sensors /1 (TEM/HUM1) and /2 (TEM/HUM2) of the main body and the temperature sensor of PF-703*1/706 detect the environmental temperature and humidity. The detected condition is reflected to the controls related to fusing, transfer, charging, exposure and developing.

*1 PF-703 is attachable only to 1250/1250P/1052.

(c) Execution timing

- There are 3 methods for the environmental decision control; the morning temperature and humidity decision, the real-time temperature decision and the real-time humidity decision. Each control uses different sensor.
- Morning temperature and humidity decision
 - When the sub power switch (SW2) turns ON 8 hours or more after from previous OFF, it performs this control.
 - The drum temperature sensor (TH5) and the temperature-humidity sensors /1 (TEM/HUM1) and /2 (TEM/HUM2) detect the environmental temperature and humidity. The detected condition is reflected to all controls related to fusing, charging, exposure and developing.
 - The detected temperature is classified into 3 levels and the humidity is classified into 4 levels.
 - The reference temperature and the humidity used for the classification differs in accordance with the period of time elapsing between the previous SW2 OFF and the next ON.
 - When the time elapsed is less than 8 hours, it does not perform the environmental decision but applies the conditions of the previous decision.
- Real-time temperature decision
 - The temperature sensor of PF-703*1/706 detects the environmental temperature. The detected condition is reflected to the fusing-related controls.
 - These detections are performed at the prescribed intervals in real time.
 - The reflection of the condition to the fusing-related controls is performed when the temperature level detected by this decision differs from the level detected by the morning decision prescribed times in succession.
 - When the detected temperature is under or over the prescribed temperature, it regards PF-703*1/706 as not connected and applies the temperature level detected by the morning temperature and humidity decision.
- Real-time humidity decision
 - The temperature-humidity sensors /1 (TEM/HUM1) and /2 (TEM/HUM2) detect the humidity. The detected condition is reflected to the control related to the transferring.
 - These detections are performed at the prescribed intervals in real time. The detected humidity is classified into 4 levels, however the reference humidity value used for this classification differs in accordance with the humidity level classified by the morning temperature and humidity decision.
 - The reflection to each control is performed when the drum motor (M2) turns ON after print start.

*1 PF-703 is attachable to 1250/1205P/1052 only.

(2) Charger cleaning control**(a) Purpose**

- It cleans the charging wire of the charger periodically to make the discharge uniform.

(b) Method

- The charger cleaning motor (M23) drives the charger cleaning unit which cleans the charging wire by its shuttle operation.

(c) Execution timing

- When the fusing temperature is 50°C or less with the sub power switch (SW2) ON, and the PM count value is over the prescribed value (The DIPSW2-1/2/3 allows to change the cycle)
- Every prints from the above timing.
- When the count value reaches the prescribed value during a job, it stops that job to perform the charger cleaning. After completing the cleaning, it resumes the job (The DIPSW2-4/5 allows to change the cycle)

(3) Drum rotation control**(a) Purpose**

- To prevent drum charge dissipation such as an blurred image at a high humidity.
- When left unused at a low or normal humidity, to prevent an uneven density due to the difference in sensitivity between the cleaning unit area and the developing unit area on the drum.

(b) Method

- When the fusing temperature is 50°C or less with the sub power switch (SW2) ON, perform this operation at the same time as the fusing unit is in the warm-up.

(4) Package correction control**(a) Purpose**

- When the default condition is met, conduct the control reserve to perform the several corrections collectively in response to long-term fluctuation such as in the morning.
- When the performance condition is met after the reserve of the batch correction control is made, the corrections specified in advance are performed in order automatically.

(b) Correction controls as an object of the package correction control

- Items as follows are the object of the package correction control. They are performed in this order.
 1. Potential stabilization control
 2. Base line correction control
 3. Maximum density control

(c) Performance reserve condition

- When the fusing temperature is 50°C or less with the sub power switch (SW2) ON.
- When the PM count value is over the prescribed value. (The DIPSW6-5/6 allows to change the cycle.)

(d) Execution timing

- Perform this operation at the same time as the fusing unit is in the warm-up.

(5) Potential correction control**(a) Purpose**

- To maintain the developing potential difference and gray background margin potential difference at a fixed condition at all times without being influenced by the drum used history (number of prints) and the environmental conditions, it controls the developing bias, the charging grid voltage and the charging current.
- To perform these controls, the drum potential sensor (DPS) is equipped.

(b) Method

- It creates a latent patch with the conditions same as those applied in the last-performed dot diameter correction control (exposure time, the charging output and the developing bias). Then the drum potential sensor (DPS) detects that patch.
- It calculates the developing potential difference and the gray background margin potential difference according to the detected potential value, and then correct the developing bias, the charging grid and the charging current so that the potential differences become a prescribed value.

(c) Execution timing

- The same as the package correction control.

(6) Base line correction control**(a) Purpose**

- Correct the detection standard value of the IDC sensor which detects the patch density on the drum.

(b) Operations

- Correct the applied voltage of the IDC sensor so that the amount of the reflective light from the bared surface becomes uniform.

(c) Execution timing

- The same as the package correction control.

(7) Maximum density control**(a) Purpose**

- It is provided to maintain the maximum density of the image at a fixed condition at all times without being influenced by the environmental conditions and the number of prints, and also this function stabilizes the toner consumption.

(b) Method

- Create several toner patches on the drum surface by changing the speed of rotation of the developing roller.
- Read this patch by the IDC sensor in the toner control board (TCB) and store the number of rotations of the developing roller when the sensor output gets to the specified value, and create the image at this number of rotations.

(c) Execution timing

- The same as the package correction control.

17.2.2 Image stabilization control during printing**(1) Outline**

- Count the print quantity since the sub power switch (SW2) ON, and conduct the prescribed image stabilization control in the paper interval by every 100 prints.
- The image stabilization control performed in the paper interval is conducted while the print speed in progress is kept.

(2) Type of the image stabilization control

- The image stabilization control performed in the paper interval has 5 types that are listed as follows.
 - Charge grid voltage correction between images
 - Development bias correction between images
 - Maximum density control between images
 - Black band creation control 1 (main scan direction width 280mm)
 - Black band creation control 2 (main scan direction width 316mm)
- The image stabilization control performed in the paper interval conducts different description depending on the Print quantity.
- The image stabilization control performed in the paper interval is selected only one item from 5 types of items at one time.

(3) Charge modification between images

- Measures the patch created in the paper interval by the surface electrometer and corrects the charge grid voltage so that the development field and the surface potential becomes the target.

(4) Charge grid voltage correction between images

- Measures the surface potential of the drum with the surface electrometer and corrects the charge grid voltage so that the surface potential becomes the target.

(5) Maximum density control between images

- Reads the patch created in the paper interval by the IDC sensor and corrects the number of drive rotation of the developing roller so that the patch density becomes the target.

(6) Black band creation control 1 (main scan direction width 280mm)

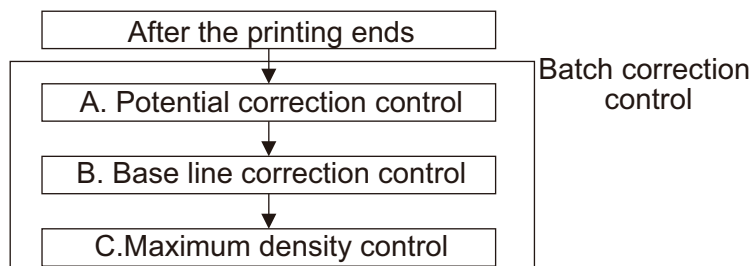

- Creates a black band which is 280mm width in the main scan direction to prevent the developer and the toner from deterioration.

(7) Black band creation control 2 (main scan direction width 316mm)

- In order to supply the tonner to the edge of the cleaning brade, create a black band which is 316mm width in the main scan direction.

17.2.3 Image stabilization control after the printing ends

- Conducts the image stabilization control after the printing ends, when the PM count exceeds the specified number while in the print.
- The following shows the flow of the operation of the image stabilization control after the printing ends.

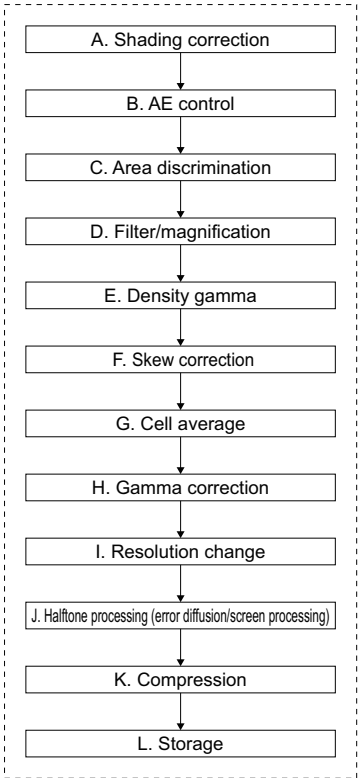

- DIPSW enables to change the PM count value which conducts the image stabilization control.

18. IMAGE PROCESSING

18.1 Image processing in the scanner section

18.1.1 Image processing flow in the scanner section

18.1.2 Shading correction

- This is a measure to obtain an even distribution from light of the CCD.
- The following corrections are made at the prescribed timing.

a. White correction

- The output voltage of each pixel of the CCD sensor when the white reference plate is exposed to the exposure lamp is stored as the maximum output of the pixel.

b. Black correction

- The output voltage of each pixel of the CCD sensor when the exposure lamp is turned off is stored as the minimum output of the pixel.
- Conduct calculation to find out what step in this range falls on the image data read from the original based on the difference between the black and white data for each pixel stored in the steps a. and b. stated above, and output the results of the calculation in the 10bits accuracy.

a0g6t2c076ca

[1] AD conversion input	[2] Shading correction output
-------------------------	-------------------------------

18.1.3 AE control

- Through the AE control, a density suitable for the original density is automatically selected and the copy is made properly.

(1) Sampling area**(a) In original glass mode**

[1]	30mm	-
-----	------	---

(b) While in the DF print

[1]	4mm	[2]	1mm
-----	-----	-----	-----

(2) Execution timing

- In original glass print : At the pre-scan before the actual scan when the print or the read starts.
- While in the DF print: At the same time as when the original is read.

18.1.4 Area discrimination

- To make a copy of the original under the correct condition (to make a correct filter processing), check the read section to see if it is a character or a dot picture, and use the results at the image-processing unit at the later stage.

18.1.5 Filter/magnification**(1) Filter processing**

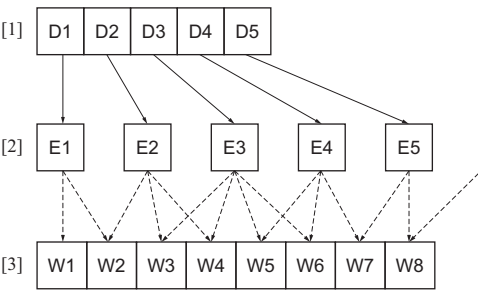

- An appropriate filter processing is made according to the type of an original and the magnification selected.
 - Character: Make the shading of an original conspicuous.
 - Dot section: Suppress moire.
 - Picture: Increase the reproducibility of gradation.

(2) Magnification processing

- For this machine, the sub scan direction magnification is made by the scan speed of the exposure unit (original glass mode) or by the conveyance speed of the DF (DF mode), and the main scan direction magnification is made by processing images electrically.

(a) Main scan magnification processing while in enlargement

- In the following example, if the data of each pixel obtained by reading the original with the CCD are D1 to D5, the positions of the read data in enlarged are E1 to E5.
- When the writing is made only with the data thus read, the following problems occur.
 - It occurs a clearance between data, and this result in a distorted image.
 - The data position does not fall in exactly with the write position.
- As shown with dotted lines in the following drawing, when there is no read data that corresponds exactly to the write position, a density is decided for writing as following and appropriate processing is made.

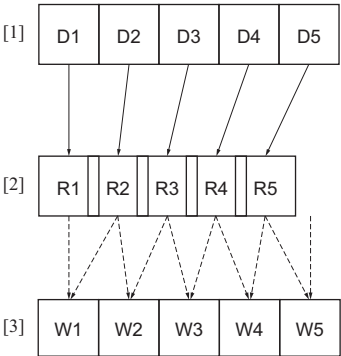

1050to2332c

[1]	Position at which the original is read	[2]	Data position while in enlargement
[3]	Write position		-

(b) Main scan magnification processing while in reduction

- In the following example, if the data of each pixel obtained by reading the original with the CCD are D1 to D5, the positions of the read data in reduced are R1 to R5. They are overlapping each other and do not correspond to the write position.
- Therefore, a density is decided for writing as following and an appropriate processing is made.

1050to2333c

[1]	Position at which the original is read	[2]	Data position while in enlargement
[3]	Write position		-

(c) Density adjustment

- With the density shown in the axis of coordinate and the position shown in the abscissa axis, when E2-E1 in the drawing of "(1) Vertical magnification while in enlargement" is shown in 16 steps to the direction of the abscissa axis, the following drawing is obtained.
- When the position to the written data W2 is "l," the density S can be obtained in the following expression.
$$S = E1 + \{(E2 - E1) / 16\} \times L$$

a0g6t2c079ca

18.1.6 Scanner gamma correction

- To the data obtained after the filter/magnification processing, select a density curve corresponding to the density button selected on the operation panel.
- An appropriate density curve is provided for each of the character/picture/character and the picture/thin character modes.

18.1.7 Skew correction

(1) DF original skew auto adjustment

- Detect an uneven original skew amount for each DF original by the original skew sensors /Fr (PS312) and /Rr (PS311) and adjust the skew amount detected by the sensors by rotating the image data while in the image processing.

18.1.8 Cell average (only for picture mode)

- When performing the screen output, it performs the smoothing process to prevent the moire caused by the contact of the original and the screen process.

18.1.9 Gamma correction (only for picture mode)

- The inputted image data density and the density at printing are unproportional because of the characteristics of the photo conductor or the developing section, therefore the correction is performed to make the print gradation closer to linear one.

18.1.10 Resolution change

- It changes the 600 dpi scanned data to 1200 dpi.

18.1.11 Halftone processing (error diffusion/screen processing)

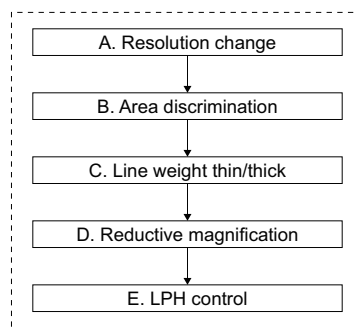

- To make effective use of the installed memory and obtain an excellent copy image, error diffusion processing is employed, which is one of the pseudo-intermediate processing methods.
- In picture mode, the screen processing is conducted.

18.1.12 Compression

- To store more image data, data is stored temporarily in the image memory after the images has been compressed.
- 2 types of memories are provided.
- A part of the hard disk is used as an extended memory of the above.
- In this manner, more than 10,000 pages can be stored in the average word processor documents.

18.1.13 Store

- The image/setting of the originals read by the scanner or the images sent from the IC can be stored as a file in the hard disk in the main body.

18.2 Image processing in the write section**(1) Convert the resolution (600 dpi, only for anti-shaggy)**

- Convert the shaggy image to the one outlined in a curved line.

(2) Area discrimination

- It performs the area discrimination on the edges of the letters and lines, and in accordance with the results performs an image process.
- It uses the same process as the area discrimination of the scanner but this function is used for the letter area discrimination for the operation for making line weight thinner/thicker.

(3) Line weight thin/thick**(a) Making line weight thinner**

- To reduce the letter growing due to the dot gain or the toner spillage at printing, it output the lines thinner using the image process.

(b) Making line weight thicker

- When processing the outline letters, the letters are slimmed down by the surrounding dots due to the dot gain or the toner spillage at printing. To prevent this condition, it output the lines thicker using the image process.

(4) Reductive magnification

- When in the duplex printing, the paper shrinks due to the heat fusing for the front side print, and it makes a magnification error for the back side print.
- To reduce this error, it performs the image process to adjust the proportion between the front side and the back side, by reducing the print magnification for the back side, or enlarging for the front side.

(5) LPH control

- To prepare an image data to process with the LED light, the image data is rearranged the and the correction data is transmitted.
- adjusting the variation of each LED device enables to obtain the uniform light emission volume.

19. POWER SOURCE SECTION

19.1 Operating parts with the connection of the power cord

19.1.1 Configuration

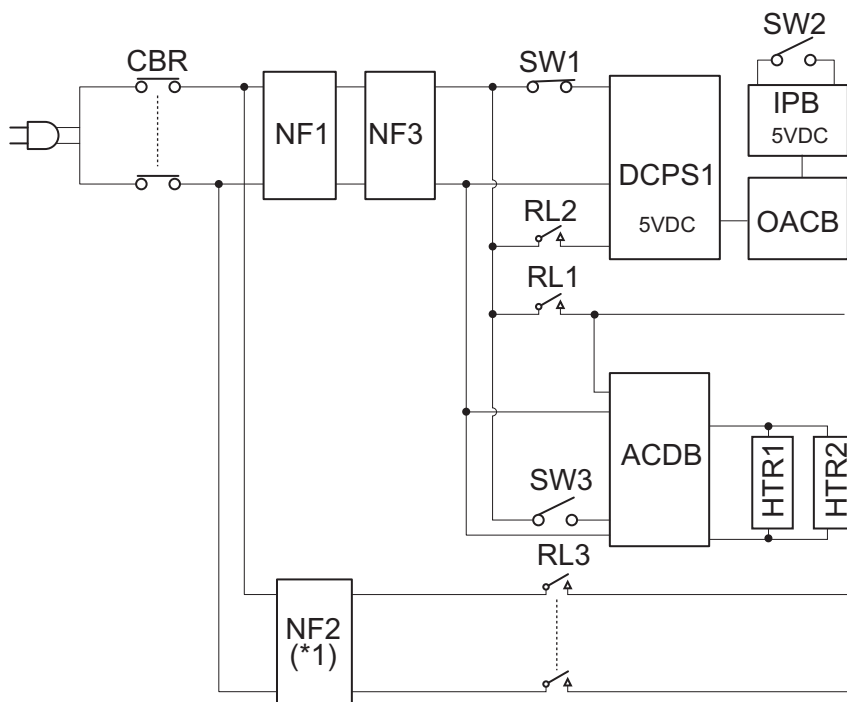

*1 PRO 951 is unimplemented.

19.1.2 Operation

- The AC line is provided with a circuit breaker (CBR) which cuts off the AC line by itself when an excessive current flows due to a short circuit while in setting the power plug.
- Also, it reduces the noise which comes from the power line with the noise filters /1 (NF1), /2 (NF2) and /3 (NF3).

19.2 Operating parts with the main power switch (SW1) ON

19.2.1 Configuration

*1 PRO 951 is unimplemented.

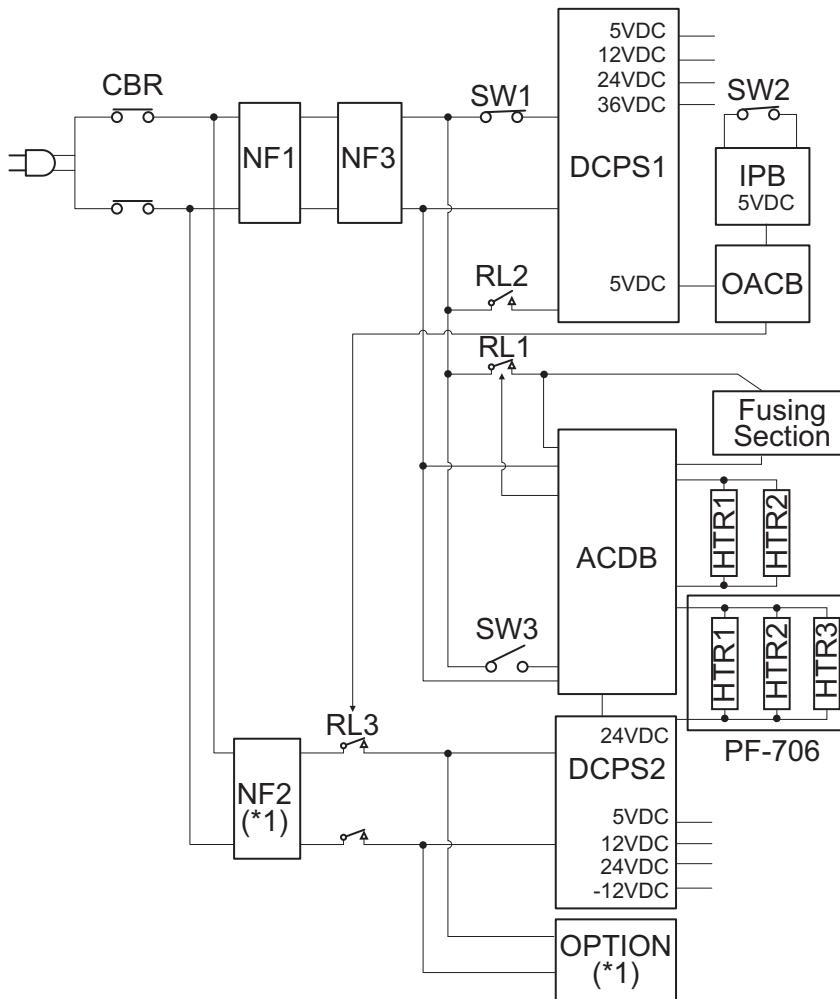

19.2.2 Operation

- When the main power switch (SW1) is turned ON, the AC power is supplied to the DC power supply /1 (DCPS1).

- In this manner, DCPS1 generates 5VDC and 12VDC and supplies them to the overall control board (OACB) and image processing board (IPB).
- This operation puts the sub power switch (SW2) connected to IPB in the standby for input.
- The AC line is provided with a circuit breaker (CBR) which cuts off the AC line by itself when an excessive current flows due to a short circuit while in SW1 ON.

19.3 Operating parts with the sub power switch (SW2) ON

19.3.1 Configuration

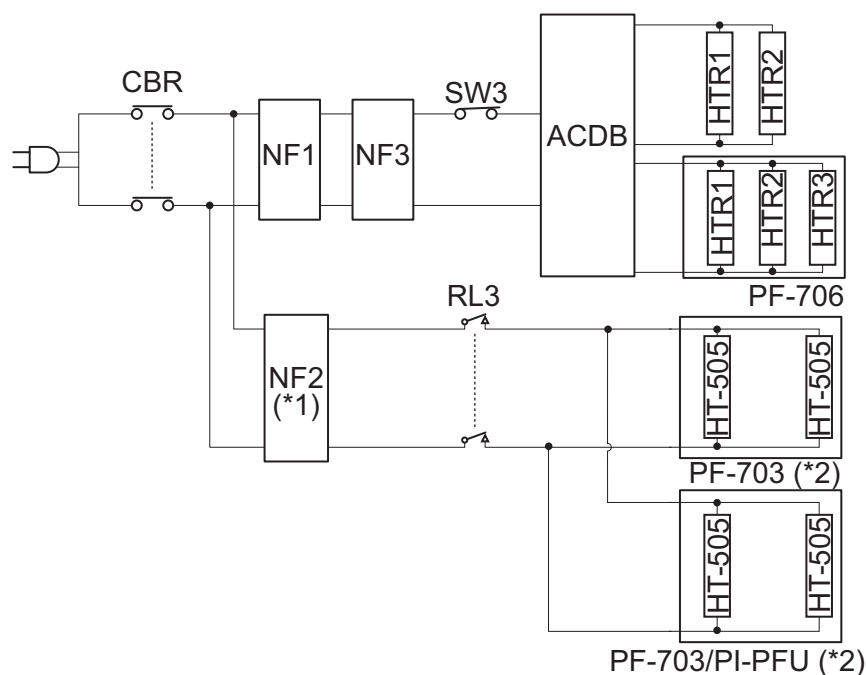

*1 PRO 951 is unimplemented.

19.3.2 Operation

- When turning on the sub power switch (SW2) the moment the main power switch (SW1) is turned on, the DC power supply /1 (DCPS1) supplies 24V DC power system to each of the boards, the FS and the DF.
- The overall control board (OACB) turns ON the relay /2 (RL3) and it supplies AC power supply to the DC power supply /2 (DCPS2).
- DCPS1 and DCPS2 supply each DC power supplies to the optional devices and each board.
- After 24VDC is supplied to the AC drive board (ACDB) from DCPS2, the main relay (RL1) turns ON to supply AC power supply to the fusing heater lamps /1 (L1), /2 (L2) and /3 (L3).
- By this operation, power is supplied to each boards and starts the initial operation of the main body.

19.4 Operating parts with the dehumidification heater switch (SW3) ON

19.4.1 Configuration

*1 PRO 951 is unimplemented.

*2 PF-703/HT-505/PI-PFU can be connected to 1250/1250P/1052 only.

19.4.2 Operation

- Once the power plug is set to the outlet while the dehumidification heater switch (SW3) is ON and the sub power switch (SW2) is OFF, the dehumidification heaters /1 (HTR1) and /2 (HTR2) and the dehumidification heaters /1 (HTR1), /2 (HTR2) and /3 (HTR3) of PF-706 turn ON.
- HT-505, which is the optional dehumidification heater for PF-703 and PI-PFU (PF-703 + FA-501), turns ON/OFF in accordance with the status of the relay 2 (RL3), regardless whether SW3 is ON or OFF.
- Up to 2 HT-505s can be installed for each PF-703.
- When using multiple PF-703s for tandem of PF-703 or PI-PFU, up to 4 are available for a whole system.

20. FAN CONTROL

20.1 Configuration

[1] Image processing cooling fan (FM12)	[2] IC cooling fan (FM39)
[3] Suction cooling fan /1 (FM6)	[4] Charger suction fan (FM3)
[5] IC exhaust fan (FM43)	[6] Developing cooling fan (FM31)

[25] Sensor cooling fan /2 (FM40)	[26] Toner bottle cooling fan (FM35)
[27] Collection pipe cooling fan (FM34)	[28] Paper exit cooling fan /Lw2 (FM28)
[29] Paper exit cooling fan /Up (FM4)	[30] Front cooling fan (FM18)
[31] Scanner cooling fan (FM19)	[32] Paper exit cooling fan /Lw1 (FM10)
[33] Pump cooling fan (FM11)	[34] Cooling fan /1 (FM1)
[35] Cooling fan /2 (FM2)	[36] Charger exhaust fan (FM44)

*1 PRO 951 is unimplemented.

20.2 Operation

20.2.1 Cooling fan /1 (FM1) control

(1) Purpose

- To exhaust around the photo conductor section and the fusing section.

(2) Low Speed/High Speed switch timing

- Rotates at low speed during the standby and low power mode.
- Rotates at high speed during warming up.
- Switches to high speed upon starting of printing.
- Switches to low speed a specified period of time after printing is finished.

20.2.2 Cooling fan /2 (FM2) control**(1) Purpose**

- To exhaust around the photo conductor section and the fusing section.

(2) Low Speed/High Speed switch timing

- Rotates at low speed during the standby and low power mode.
- Rotates at high speed during warming up.
- Switches to high speed upon starting of printing.
- Switches to low speed a specified period of time after printing is finished.

20.2.3 Charger suction fan (FM3) control**(1) Purpose**

- To cool down around the photo conductor section.

(2) Low Speed/High Speed switch timing

- Rotates at low speed during the warm-up and print operation, and turns OFF after a specified period of time.
- Turns OFF during standby and low power mode.

20.2.4 Paper exit cooling fan /Up (FM4) control**(1) Purpose**

- To cool down around the paper exit section with suction.

(2) ON/OFF timing

- Rotates at high speed during warming up.
- Turns OFF during standby and low power mode.

20.2.5 Suction cooling fan /1 (FM6) control**(1) Purpose**

- To cool down around the LPH section with suction.

(2) Low Speed/High Speed switch timing

- Rotates at low speed during the standby and low power mode.
- Rotates at high speed during warming up.
- Switches to high speed upon starting of printing.
- Switches to low speed a specified period of time after printing is finished.

20.2.6 Suction cooling fan /2 (FM7) control**(1) Purpose**

- To cool down around the developing section and the photo conductor section with suction.

(2) ON/OFF timing

- Rotates at high speed during warming up.
- Turns OFF a specified period of time after the print completes
- Turns OFF during standby and low power mode.

20.2.7 Paper exit cooling fan /Lw1 (FM10), /Lw2 (FM28) control**(1) Purpose**

- To cool down around the paper exit section with suction.

(2) ON/OFF timing

- Turns ON during printing.
- Turns OFF during standby, low power mode and warming up.

20.2.8 Pump cooling fan (FM11) control**(1) Purpose**

- To cool down the toner pump motor (M28) and the air pump motor (M29) with suction.

(2) ON/OFF timing

- Rotates at high speed during warming up.
- Turns OFF a specified period of time after the print completes
- Turns OFF during standby and low power mode.

20.2.9 Image processing cooling fan (FM12) control**(1) Purpose**

- To cool down around the overall control board (OACB) and the image processing board (IPB) with suction.

(2) ON/OFF timing

- Turns ON/OFF in accordance with the ON/OFF of the sub power switch (SW2).

20.2.10 ADU cooling fan /3 (FM13) control**(1) Purpose**

- To cool down around the reverse section with suction.

(2) ON/OFF timing

- Turns ON during printing.
- Turns OFF during standby, low power mode and warming up.

20.2.11 ADU cooling fan /1 (FM14) control**(1) Purpose**

- To cool down around the duplex section with suction.

(2) ON/OFF timing

- Turns ON during printing.
- Turns OFF during standby, low power mode and warming up.

20.2.12 ADU cooling fan /2 (FM15) control**(1) Purpose**

1. To exhaust around the duplex section.

(2) ON/OFF timing

- Turns ON during printing and warming up.
- Turns OFF a specified period of time after the print completes
- Turns OFF during standby and low power mode.

20.2.13 Sensor cooling fan /1 (FM16), /2 (FM40) control**(1) Purpose**

- To cool down around the ADU reverse section with suction.

(2) ON/OFF timing

- Turns ON during printing.
- Turns OFF during standby, low power mode and warming up.

20.2.14 Registration cooling fan (FM17) control**(1) Purpose**

- To cool down around the registration section with suction.

(2) ON/OFF timing

- Turns ON during printing.
- Turns OFF during standby, low power mode and warming up.

20.2.15 Front cooling fan (FM18) control**(1) Purpose**

- Cool down around the drum cleaner with suction.

(2) ON/OFF timing

- Turns ON during printing.
- During warm-up, the fan is activated in synchronization with the drum motor (M2).
- Turns OFF a specified period of time after the print completes
- Turns OFF during standby and low power mode.

20.2.16 Scanner cooling fan (FM19) control**(1) Purpose**

- To cool down around the exposure lamp (L4) and the scanner.

(2) ON/OFF timing

- Turns ON during printing.
- Turns OFF during standby, low power mode and warming up.

20.2.17 Paper feed assist fan /Fr1 (FM21), /Rr1 (FM20) control (1250/1250P/1052 only)**(1) Purpose**

- To assist the paper feed from the tray /1.

(2) ON/OFF timing

- During printing, the fan is activated depending on the type of paper.
- Turns OFF during standby, low power mode and warming up.

20.2.18 Developing suction fan (FM22) control**(1) Purpose**

- To collect toner scattered around the developing unit.

(2) ON/OFF timing

- Turns ON during printing and warming up.
- During warm-up, the fan is activated in synchronization with the drum motor (M2).
- Turns OFF during standby, low power mode.

20.2.19 Paper feed assist fan /Fr2 (FM23), /Rr2 (FM24) control (1250/1250P/1052 only)**(1) Purpose**

- To assist the paper feed from the tray /2.

(2) ON/OFF timing

- During printing, the fan is activated depending on the type of paper.
- Turns OFF during standby, low power mode and warming up.

20.2.20 Transfer belt cleaning fan (FM27) control**(1) Title**

- To cool down around the transfer belt section with suction.

(2) Title

- Rotates at high speed during the print and warm-up.
- Switches to low speed a specified period of time after printing is finished.
- Rotates at low speed during the standby and low power mode.

20.2.21 De-curler fan /1 (FM29), /2 (FM30) control**(1) Title**

- To cool down the de-curler section with suction and exhaust.

(2) Title

- Turns ON during printing.
- Turns OFF during standby, low power mode and warming up.

20.2.22 Developing cooling fan (FM31) control**(1) Purpose**

- To cool down around the developing section with suction.

(2) ON/OFF timing

- During warm-up, the fan is activated in synchronization with the drum motor (M2).
- Turns OFF a specified period of time after the print completes
- Turns OFF during standby and low power mode.

20.2.23 Collection pipe cooling fan (FM34) control**(1) Purpose**

- To cool down around the toner collection section with suction.

(2) Low Speed/High Speed switch timing

- Rotates at high speed during warming up.
- Switches to high speed upon starting of printing.
- Turns OFF during standby and low power mode.

20.2.24 Toner bottle cooling fan (FM35) control**(1) Purpose**

- To cool down around the toner bottle section with suction.

(2) Low Speed/High Speed switch timing

- Rotates at high speed during the print and warm-up.
- Switches to low speed a specified period of time after printing is finished.
- Turns OFF during low power.
- Rotates at low speed during standby.

20.2.25 Belt cooling fan (FM37) control**(1) Purpose**

- To cool down around the transfer belt section with suction.

(2) ON/OFF timing

- Turns ON during the print and warm-up.
- Turns OFF a specified period of time after the print completes
- Turns OFF during standby and low power mode.

20.2.26 Reverse cooling fan (FM38) control**(1) Purpose**

- To cool down around the ADU reverse section with suction.

(2) ON/OFF timing

- Turns ON during the print and warm-up.
- Turns OFF a specified period of time after the print completes
- Turns OFF during standby and low power mode.

20.2.27 IC cooling fan (FM39) control**(1) Purpose**

- Conduct the cooling around the IC board (ICB).

(2) ON/OFF timing

- Rotates at low speed during the standby, warm-up, and low power mode.
- Rotates at high speed during the print.
- Switches to low speed a specified period of time after printing is finished.

20.2.28 DC power supply /1 cooling fan (FM41) control**(1) Purpose**

- To exhaust around the DC power supply /1 (DCPS1).

(2) Low Speed/High Speed switch timing

- Rotates at low speed during standby, low power mode and warming up.
- Switches to high speed upon starting of printing.
- Switches to low speed a specified period of time after printing is finished.

20.2.29 DC power supply /2 cooling fan (FM42) control**(1) Purpose**

- To exhaust around the DC power supply /2 (DCPS2).

(2) Low Speed/High Speed switch timing

- Rotates at low speed during standby, low power mode and warming up.
- Switches to high speed upon starting of printing.
- Switches to low speed a specified period of time after printing is finished.

20.2.30 Controller exhaust fan (FM43) control**(1) Purpose**

- To exhaust around the hard disk /2 (HDD2).

(2) ON/OFF timing

- Turns ON/OFF in accordance with the ON/OFF of the sub power switch (SW2).

20.2.31 Charger exhaust fan (FM44) control**(1) Purpose**

- To exhaust around the charging corona.

(2) ON/OFF timing

- Rotates at high speed during the print and warm-up.
- Turns OFF a specified period of time after the print completes
- Turns OFF during standby and low power mode.

21. COUNTER CONTROL

21.1 Configuration

21.2 Operation

Item	Specification/mechanism
Total counter (CNT1)	Displays the cumulative number of prints in all copy/print modes Mechanical counter driven by the electronic signal. Counts up for each paper exit signal.
Electronic counter	<ul style="list-style-type: none"> Displays the cumulative number of copies/prints on the operation panel. PM count/cycle, data collection *1, and copy count by parts that require to be replaced. Counts up for each paper exit signal.

*1 Refer to "1.5.5.2 Collection Data."

(1) Status indicator light

- Installing a status indicator light allows the machine status to be monitored at a place away from the machine according to the condition of the light.

[1] Connector				[2] Status indicator light	
Connector	Pin Number	Signal name	Description	Output timing	Type of signal
160	1	PAT1	Light ON signal	L signal output when the printing available	Open collector
	2	PAT2		L signal output while in the scanning or printing operation	
	3	PAT3		L signal output when an abnormal stop occurs due to jams, error codes, no paper, or no toner	
	4	PAT4		L signal output when the toner supply message is displayed	
	5	24V	24V DC source	At all times	24V, 500mA
	6	P.GND	Power ground	-	-

Note

- A signal is output from the PAT3 when an error code occurs. However, the light does not turn on since the power source of the 24V status indicator light is cut off.

22. HDD CONTROL

22.1 Configuration

Symbol	Item	Specification/mechanism
[1]	Hard disk /1 (HDD1)	<ul style="list-style-type: none"> · Hard disk for the main body · Capacity: 250GB · Storage of formatted stamp, watermark and registered overlay image data · Storage of image data · Temporary storage of image data (image memory)
[2]	Hard disk /2 (HDD2)	<ul style="list-style-type: none"> · Hard disk for the IC controller · Capacity: 250GB

22.2 Removable hard disk

22.2.1 OUTLINE

- By installing the option (RH-101), the hard disks /1 (HDD1) and /2 (HDD2) can be used as removable disks.
- To secure the primary data stored in HDD, any user can remove the HDD.

22.2.2 Operation

- Move the hard disk /1 (HDD1) for the main body and the hard disk /2 (HDD2) for the IC controller to the removable cassette of RH-101.
- This operation enables to remove each hard disk after using the main body to put them in a high-security place such as a safe.

[3] Paper exit gate	[4] Image read position (slit glass section)

(3) Paper exit

df603to1010c

[1] Original feed tray	[2] Original exit tray (for large size)
[3] Paper exit gate	[4] Exit roller

1.2.5 Mixed original mode**(1) When the Auto Zoom is not in use**

- Single-sided original mode: Same as the normal single-sided original mode
- Double-sided original mode: Same as the normal double-sided original mode

(2) When the Auto Zoom is in use (Single or double-sided)

- Since the mixed copy mode makes the size detection in the sub scan direction of the original according to the ON time of the original registration sensor /Rt (PS318) (in case of DF-615) or the original registration sensor /Lt (PS306) (in case of DF-616), the size detection operation is made before the scan operation.
- The following shows the operations after that.
 - Single-sided original mode: Same as the normal single-sided original mode
 - Double-sided original mode: Same as the normal double-sided original mode
- For details of the size detection control, refer to "[PA.2.3.1 Size detection control](#)".

(3) Z-Folded original mode

- Only for the 1st sheet, since the Z-Folded original mode makes the same size detection as the mixed original mode in the sub scan direction of the original according to the ON time of the original registration sensor /Rt (PS318) (in case of DF-615) or the original registration sensor /Lt (PS-306) (in case of DF-616), the size detection operation is made before the scan operation.
- The following shows the operations after that.
 - Single-sided original mode: Same as the normal single-sided original mode
 - Double-sided original mode: Same as the normal double-sided original mode
- For details of the size detection control, refer to "[PA.2.3.1 Size detection control](#)".

2. PAPER FEED SECTION

2.1 Configuration

df603to2001c

	Item	Specification/mechanism
[1]	Original size detection in the main scan direction	Guide plate + VR
[2]	Original size detection in the sub scan direction	Photo sensor
[3]	Original feed tray up-down method	Up-down plate + motor
[4]	Multi feed detection (DF-615 only)	Ultrasonic sensor (DF-615 only)
[5]	Registration method	Roller + motor

2.2 Drive

2.2.1 Tray up-down drive

df603to2002c

[1]	Up-down plate	[2]	Tray up-down motor (M305)
-----	---------------	-----	---------------------------

2.2.2 Paper feed drive

df603to2003c

[1]	Registration roller	[2]	Original feed motor (M301)
[3]	SDF switching solenoid (SD301)	[4]	Pick-up roller
[5]	Paper feed roller		-

2.3 Operation

2.3.1 Size detection control

(1) Nomal original mode

(a) Size detection in the main scan direction

- The size in the main scan direction of the original is detected according to the position of the guide plate that is connected to the original size VR (VR301).

(b) Size detection in the sub scan direction

- The size in the sub scan direction of the original is detected according to the ON/OFF combination of the original size sensor /Rt (PS302) and the Original size sensor /Lt (PS303).

(2) Mixed original mode

(a) Size detection in the main scan direction

- The front and rear dimensions of the maximum mixed original are detected according to the position of the guide plate of the original size VR (VR301).

(b) Size detection in the sub scan direction (DF-615)

- The conveyance roller [3] rotates in the forward direction to convey the original to the paper exit tray (for large size) [2].
- The conveyance roller stops rotation a specified period of time after the original registration sensor /Rt (PS318) [1] detects the trailing edge of the original.
- At this time, the size in the sub scan direction of the original is detected depending on the ON time period of the PS318.

df603to2004c

[1]	Original registration sensor /Rt (PS318)	[2]	Paper exit tray (for large size)
[3]	Conveyance roller	-	

- A specified period of time after the original registration sensor /Rt (PS318) [1] turns OFF, the conveyance roller [3] rotates in the reverse direction to get the leading edge of the original conveyed to the paper exit section back to the scan standby position [5].
- The trailing edge of the original returned is conveyed to the paper exit tray (for large size) [2] according to the form of the conveyance guide plate.
- The reverse rotation of the conveyance roller stops a specified period of time after the original conveyance sensor (PS308) [4] detects the leading edge of the original.

df603to2005c

[1]	Original registration sensor /Rt (PS318)	[2]	Paper exit tray (for large size)
[3]	Conveyance roller	[4]	Original conveyance sensor (PS308)
[5]	Scan standby position	-	

- After that, the same read (scan) operation as in the normal mode is made.
- The original size detection operation for the second and succeeding originals varies according to a copy mode employed: the single-sided copy mode or the double-sided copy mode.
 - Single-sided copy mode: After the scan operation of the preceding original starts.
 - Double-sided copy mode: After the scan operation of the back side of the preceding original starts.

(c) Size detection in the sub scan direction (DF-616)

- The conveyance roller [3] rotates in the forward direction to convey the original to the paper exit tray (for large size) [2].
- The conveyance roller stops rotation a specified period of time after the original registration sensor /Lt (PS306) [1] detects the trailing edge of the original.

- At this time, the size in the sub scan direction of the original is detected depending on the ON time period of the PS306.

15sat2c004na

[1]	Original registration sensor /Lt (PS306)	[2]	Paper exit tray (for large size)
[3]	Conveyance roller		-

- A specified period of time after the original registration sensor /Lt (PS306) [1] turns OFF, the conveyance roller [3] rotates in the reverse direction to get the leading edge of the original conveyed to the paper exit section back to the scan standby position [5].
- The trailing edge of the original returned is conveyed to the paper exit tray (for large size) [2] according to the form of the conveyance guide plate.
- The reverse rotation of the conveyance roller stops a specified period of time after the original conveyance sensor (PS308) [4] detects the leading edge of the original.

15sat2c005na

[1]	Original registration sensor /Lt (PS306)	[2]	Paper exit tray (for large size)
[3]	Conveyance roller	[4]	Original conveyance sensor (PS308)
[5]	Scan standby position		-

- After that, the same read (scan) operation as in the normal mode is made.
- The original size detection operation for the second and succeeding originals varies according to a copy mode employed: the single-sided copy mode or the double-sided copy mode.
 - Single-sided copy mode: After the scan operation of the preceding original starts.
 - Double-sided copy mode: After the scan operation of the back side of the preceding original starts.

2.3.2 Pick-up mechanism

- The tray up-down motor (M305) sends up the up-down plate [2] to move the original to the pick-up roller position [1].
- When the tray upper limit sensor (PS315) [4] turns ON, the M305 turns OFF to the standby condition with the up-down plate left raised.
- The original comes into contact with the pick-up roller [3] to conduct the pick-up (paper feed) operation.

df603to2006c

[1]	Pick-up roller position	[2]	Up-down plate
[3]	Pick-up roller	[4]	Tray upper limit sensor (PS315)

2.3.3 Separation mechanism

(1) Separation control

- Of the originals fed by the pick-up roller, only 1 sheet of original is conveyed to the registration roller side by the original feed roller and the separation roller.

- Even when plural sheets of originals are fed, the separation roller makes a reverse rotation to convey a single sheet of original.

(2) SDF (single document feeder) control

- In the single document feeder mode, to improve the paper feedability of thick paper and other originals the paper feed of which is not guaranteed, the SDF switching solenoid (SD301) cuts off the drive of the separation roller to conduct the paper feed operation.

(3) Multi feed detection control (DF-615 only)

- The multi feed detection is made by using the multi feed detection board /R (MFDBR) and the multi feed detection board /S (MFDBS) which employ a method to check originals if they are multi fed based on the amount of the transmission of ultrasonic waves.
- The accuracy in the multi feed detection has been improved by using the multi feed sensor of the ultrasonic sensor, which supports the speed-up in the paper feed.
- The multi feed detection board is made up of a pair of a sender and a receiver.
- The following are originals the multi feed of which can be detected.
 - Originals the main scan direction of which is in excess of 210mm. Originals the main scan direction of which is less than 210mm cannot be recognized due to the position of the multi feed detection board.
 - Originals the weighing of which is between 50g/m² and 128g/m². Originals the weighing of which is beyond the above-mentioned range are not recognized even when multi fed.

2.3.4 Original empty detection control

- The original empty sensor (PS305) detects the presence of original in the original tray section while in the scan stop.
- The original count sensor (PS310) makes the original empty detection while in the scan to stop the paper feed from the trays/1, /2, PF, or LU (DF-616 only) after PS310 detects the trailing edge of the last original.

2.3.5 Registration control

(1) DF-615

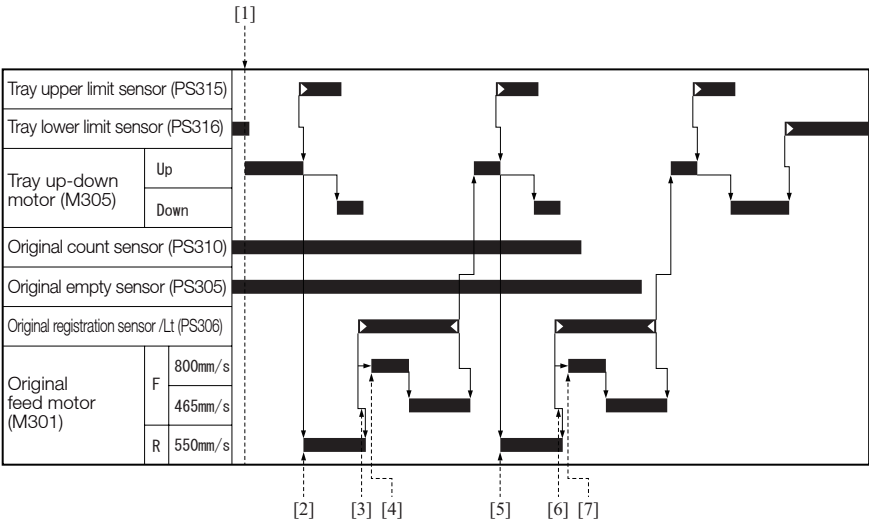

- When the start button is turned ON [1], the tray up-down motor (M305) brings up the up-down plate until the tray upper limit sensor (PS315) turns ON [2].
- A specified period of time after the PS315 turns ON, the original feed motor (M301) is driven in a reverse rotation to convey the original to the registration roller.
- When the original registration sensor /Rt (PS318) turns ON, the up-down plate comes down by a fixed distance and a loop is formed until the original registration sensor /Lt (PS306) turns ON to adjust an original skew.

[1]	Start button ON	[2]	Feed of the 1st sheet of paper
[3]	Loop formation of the 1st sheet of paper	[4]	Pre-feed of the 1st sheet of paper
[5]	Feed of the 2nd sheet of paper	[6]	Loop formation of the 2nd sheet of paper
[7]	Pre-feed of the 2nd sheet of paper	-	

(2) DF-616

- When the start button is turned ON [1], the tray up-down motor (M305) brings up the up-down plate until the tray upper limit sensor (PS315) turns ON [2].
- A specified period of time after the PS315 turns ON, the original feed motor (M301) is driven in a reverse rotation to convey the original to the registration roller.
- When the specified period of time has passed, the up-down plate comes down by a fixed distance and a loop is formed until the original registration sensor /Lt (PS306) turns ON to adjust an original skew.

[1]	Start button ON	[2]	Feed of the 1st sheet of paper
[3]	Loop formation of the 1st sheet of paper	[4]	Pre-feed of the 1st sheet of paper
[5]	Feed of the 2nd sheet of paper	[6]	Loop formation of the 2nd sheet of paper
[7]	Pre-feed of the 2nd sheet of paper	-	

3. CONVEYANCE SECTION

3.1 Configuration

	Item	Specification/mechanism
[1]	Conveyance path switching method	Flapper + solenoid
[2]	Original skew detection method	Photo sensor
[3]	Original centering detection method	LED sensor

3.2 Drive

3.2.1 Flapper up-down drive

[1]	Flapper	[2]	Gate solenoid (SD303)
-----	---------	-----	-----------------------

3.2.2 Conveyance drive

[1]	Conveyance roller	[2]	Original conveyance motor (M302)
-----	-------------------	-----	----------------------------------

3.3 Operation

3.3.1 Conveyance control

- The originals that have been fed up to the registration roller [1] by the separation mechanism are pre-fed by the registration roller to be conveyed to the conveyance roller [2] at a high speed.
- A specified period of time after the original conveyance sensor (PS308) [4] turns ON, the conveyance roller is switched into the scan speed to convey the original onto the slit glass (original scan position) [3].
- The originals are read when they pass through the slit glass.

df603to2011c

[1]	Registration roller	[2]	Conveyance roller
[3]	Slit glass (original scan position)	[4]	Original conveyance sensor (PS308)

3.3.2 Mixed original mode control

(1) DF-615

- The mixed original sizes copy mode is applicable to both the same size originals and the different size originals.
- Since the size detection in the sub scan direction of the original is made according to the ON time of the original registration sensor /Rt (PS318), the size detection operation is made before the scan operation for each original.

(2) DF-616

- The mixed original sizes copy mode is applicable to both the same size originals and the different size originals.
- Since the size detection in the sub scan direction of the original is made according to the ON time of the original registration sensor /Lt (PS306), the size detection operation is made before the scan operation for each original.

3.3.3 Z-Fold original mode control

- In the Z-Fold mode, the same detection operation as in the mixed original sizes copy mode is made on the 1st sheet of original to determine the original size. For the 2nd and succeeding originals, the normal original conveyance is made.

3.3.4 Skew correction control

- The original skew sensor /Rr (PS311) and the original skew sensor /Fr (PS312) are provided to make adjustments when the original is conveyed with its leading edge skewed.
- PS311 and PS312 are provided on the front side and the rear side of the conveyance path before scan to detect the amount of skew based on the time difference when the leading edge of the original turns ON these sensors.
- The amount of skew detected is adjusted by image processing.
- The relationship of the distance between the 2 sensors makes it effective only on original larger than A4S in width and the correction of the tilt angle up to 1.5° is made.

3.3.5 Centering correction control (DF-615 only)

- The centering sensor /Rr (PS321) and the centering LED sensor /Rr (PS322) detect the leading edge of the original pre-fed.
- According to the timing of this detection, the centering sensor /Fr (PS320) and the centering LED sensor /Fr (PS319) detect the side edge of the original to determine the effective read area in the main scan direction.
- The width of the original size that can be detected is restricted only to A4 or 11inch. PS320 needs to be positioned to the width of the original you want to detect.
- The maximum range that can be corrected is within $\pm 3\text{mm}$. When in excess of this range, only 3mm is corrected.
- The centering adjustment control is invalid for original sizes other than A4 and 11inch and in the mixed original mode.
- The sensor can detect any color in the original.

3.3.6 Cooling fan control

- The cooling fan /Lt (FM301) cools the original conveyance motor (M302) to prevent getting too hot while in operation.
- The FM301 turns ON when the original feed is started, and it turns OFF when the original exit is completed.
- The cooling fan /Rt (FM302) cools the original exit motor /1 (M303), the original exit motor /2 (M304), the DF control board (DFCB) and the tray up-down motor (M305) to prevent them from getting too hot while in operation.

4. REVERSE SECTION

-----	--	---

4.3 Operation

4.3.1 Reverse mechanism

(1) Small-size original

- When the gate solenoid (SD303) starts up, the flapper [3] closes and originals the front of which has been scanned are conveyed [2] to the reverse section by the reverse roller [1].

- A specified period of time after the original reverse sensor (PS309) [7] turns OFF by detecting the trailing edge of the original, SD303 opens the paper exit gate [6] and the reverse paper feed [5] is made while rotating in the reverse direction at a low speed and then at a high speed to guide the original to the conveyance roller [4].

[1] Reverse roller	[2] Conveyance to the reverse section
[3] Flapper	[4] Conveyance roller
[5] Reverse feed	[6] Paper exit gate
[7] Original reverse sensor (PS309)	-

(2) Large-size original

- When the gate solenoid (SD303) starts up, the flapper [5] closes and originals the front of which has been scanned are conveyed [4] to the reverse section by the reverse roller [8].
- The original conveyed to the reverse section, because it cannot be contained in the reverse section, is conveyed to the paper exit reverse section [2] by the reverse conveyance roller [9], the paper exit reverse roller [1].
- At this time, the exit gate solenoid (SD304) closes the exit gate [10].
- The originals that have been conveyed to the reverse section and the paper exit reverse section are fed in reverse [6] in the same manner as small-size originals.
- At this time, since the originals do not yet pass through the reverse roller, the reverse conveyance roller even if they reach the conveyance roller [7], after the reverse roller makes the reverse rotation, the pressure roller release solenoid (SD302) activates to release the pressure roller [3] for the reverse roller.
- The originals are released from the pressure roller and guided to the conveyance roller.

[9] Reverse conveyance roller	[10] Paper exit gate

4.3.2 Registration control

(1) Small-size original

- A specified period of time after the start of the conveyance [1] of the 1st original, the front of the 1st original is read [2].
- The 1st original conveyed to the reverse section stops temporarily after the original exit motor /2 (M304) and the original exit motor /1 (M303) accelerated it.
- M303 and M304 start a reverse rotation [3] to let the original hit against the conveyance roller for registration.
- For the original that has been registered, a specified period of time after the original conveyance sensor (PS308) turn ON [4], the back of the 1st original is read [5].

(2) Large-size original

- A specified period of time after the start of the conveyance [1] of the 1st original, the front of the 1st original is read [2].
- The 1st original conveyed to the reverse section stops temporarily after the original exit motor /2 (M304) and the original exit motor /1 (M303) accelerated it.
- M303 and M304 start a reverse rotation [3] to let the original hit against the conveyance roller for registration.
- For the back of the original that has been registered, a specified period of time after the original reverse sensor (PS309) turns ON, the pressure roller release solenoid (SD302) is turned ON [4] to release the pressure roller, and then release the conveyance force of the reverse section.
- A specified period of time after the original conveyance sensor (PS308) turns ON [5], the back of the 1st original is read [6].

[3] Paper exit roller /2	-

5.3 Operation**5.3.1 Paper exit mechanism****(1) Paper exit operation of small-size original****(a) Single-sided original**

- The originals that have been scanned are conveyed to the reverse section [3] because the flapper [4] is closed by the gate solenoid (SD303).
- The originals conveyed to the reverse section are conveyed to the exit gate [7] by the reverse roller [5] and the reverse conveyance roller [6].
- The originals are conveyed to the paper exit roller /2 [1] through the exit gate that has been opened by the exit gate solenoid (SD304).
- The paper exit roller /2 exits the originals to the original exit tray (for small size) [2] with their copied side down.

df603to2029c

[1] Paper exit roller /2	[2] Exits the originals to the original exit tray (for small-size)
[3] Conveyance to the reverse section	[4] Flapper
[5] Reverse roller	[6] Reverse conveyance roller
[7] Paper exit gate	-

(b) Double-sided original

- The originals the back side of which has been scanned are conveyed to the exit gate [5] in the same manner as with the single-sided originals.

- At this time, the exit gate solenoid (SD304) closes the exit gate, so the originals are conveyed to the paper exit reverse section [2] through the paper exit reverse roller [3].
- When the original reverse-exit sensor (PS313) [4] of the paper exit reverse section detects the originals, the paper exit reverse roller stops.
- When SD304 opens the paper exit gate, the paper exit reverse roller starts to make a high speed reverse rotation to send back the conveyed originals.
- At this time, the exit gate is open and the originals are exited to the original exit tray (for small size) [1] with their front face down.

df603to2030c

[1]	Exits the originals to the original exit tray (for small-size)	[2]	Conveyance to the paper exit reverse section
[3]	Paper exit reverse roller	[4]	Original reverse-exit sensor (PS313)
[5]	Paper exit gate	[6]	Paper exit roller /2

(2) Paper exit operation of large-size original

(a) Single-sided original

- The originals that have been scanned are conveyed to the paper exit roller /1 [2] by the conveyance roller [4] because of the flapper [3] and the paper exit gate [5] being opened by the gate solenoid (SD303).
- The paper exit roller /1 makes a low speed forward rotation to exit the originals to the original exit tray (for large size) [1] with their copied face down.

df603to2031c

[1]	Exits the originals to the original exit tray (for large size)	[2]	Paper exit roller /1
[3]	Flapper	[4]	Conveyance roller
[5]	Paper exit gate	-	

(b) Double-sided original

- The originals the rear face of which has been scanned are conveyed to the reverse section [2] because of the flapper [4] being closed by the gate solenoid (SD303).
- When the original reverse sensor (PS309) [3] detects the trailing edge of the originals conveyed, SD303 opens the flapper and the paper exit gate [5].
- The originals are exited to the original exit tray (for large size) [1] by the paper exit roller /1 [6] through the flapper that is open.

2.3 Operation

2.3.1 Up/down control

(1) Up operation

- The paper lift motors /1 (M7), /2 (M8) and /3 (M9) wind up the lift wires through the pulleys to lift up the paper lift plate.

(2) Down operation

- When the tray is pulled out, the release lever [6] returns to the direction of arrow [7] and the regulation plate [5] moves to the direction which for loosening the pressure of the spring [1].
- By this operation, the coupling gear /1 [2] which transmits the drive of the paper lift motors /1 (M7), /2 (M8), and /3 (M9) [8] is separated from the coupling gear /2 [4].
- With the up-down damper (oil damper) [3] which operates only in going down, the paper lift plate goes down slowly with its own weight.

a0gdt2c004ca

[1]	Spring	[2]	Coupling gear /1
[3]	Up-down damper (oil damper)	[4]	Coupling gear /2
[5]	Regulating plate	[6]	Release lever
[7]	Coupling gear release direction	-	

(3) Operation timing

- Once the tray is set and the paper empty sensors /1 (PS3), /2 (PS7), and /3 (PS11) detect the paper, the paper lift motors /1 (M7), /2 (M8), and /3 (M9) turn ON and move up the paper lift plate.
- When the upper limit sensors /1 (PS5), /2 (PS9), and /3 (PS13) turn ON, M7, M8, and M9 stop.
- When PS5, PS9, and PS13 turn OFF from ON during printing operation, M7, M8, and M9 turn ON again. The paper lift plate goes up until PS5, PS9, and PS13 turn ON, and then M7, M8, and M9 turn OFF.

2.3.2 Size detection control

There are 2 types of the paper size detection: detection in the main scan direction and detection in the sub scan direction.

(1) Detection mechanism

- The CD paper size VR /1 (VR2), /2 (VR5), and /3 (VR8) [6] detect the size in the main scan direction.
- The paper side guide /Fr mounting plate [7] rotates the gears of VR2, VR5, and VR8 directly to change the resistance value and detects the wide 0.628mm (0.314mm at one side of the paper side guide) for each 1° rotation.
- The FD paper size VR /1 (VR3), /2 (VR6), and /3 (VR9) [5] detect the size in the sub scan direction.
- When the paper trailing edge guide [2] is moved, the wire [3] rotates the pulley [4], changes the resistance value of VR3, VR6, and VR9, and detects 1.129mm for each 1° rotation.
- For the paper sizes shown below, it is necessary to set the paper size in the user mode, selecting [Tray Setting] - [Size Setting] - [Detection Size Setting].
 - A5, 5 1/2 x 8 1/2
 - 8 x 13, 8 1/4 x 13, 8 1/2 x 13, 8 1/8 x 13 1/4, or 8 1/2 x 14
 - SRA3, 12 x 18

a0gdt2c005ca

[3] Wire	[4] Pulley
[5] FD paper size VR/1 (VR3), /2 (VR6), /3 (VR9)	[6] CD paper size VR/1 (VR2), /2 (VR5), /3 (VR8)
[7] Paper side guide /Fr mounting plate	-

(2) Guide shift amount

- The following list shows the shift amount of the paper side guide and the paper trailing edge guide.

	Minimum position	Maximum position	Changeable amount
Gap between paper side guides	140mm *1	324mm	190mm
Paper rear guide	133mm	463mm	359.4mm

- *1 When the wide is shorter than 140mm, use the small size guides [1]. The gap between the small size guides is 95mm.

a0gdt2c006ca

[1] Small size guide	-
----------------------	---

(3) Operation timing

- It is informed to the main body after specified time when tray is set.

2.3.3 Air control

- Each tray has 4 fans; the paper assist fans /Fr and /Rr, and the paper leading edge separation fans /Fr and /Rr.

(1) Air mechanism in the main scan direction

- The paper side guides /Fr and /Rr have the paper assist fans /Fr and /Rr. It blows the air to the paper from both sides (back and forth) in the main scan direction to float the paper to be fed. It can control the rotation number of the paper feed assist fans /Fr and /Rr. It controls the number by the paper type/weight.
Tray1: Paper feed assist fan /Fr1 (FM1), /Rr1 (FM2)
Tray2: Paper feed assist fan /Fr2 (FM5), /Rr2 (FM6)
Tray3: Paper feed assist fan /Fr3 (FM9), /Rr3 (FM10)
- The intake of the paper assist fans /Fr and /Rr has the shutters /Fr and /Rr which are opened by each of the shutter solenoids /Fr and /Rr and control the air volume up or down.
When the shutter solenoid turns ON, the shutter closes to reduce the air volume.
Tray1: Shutter solenoid /Fr1 (SD4), /Rr1 (SD5)
Tray2: Shutter solenoid /Fr2 (SD6), /Rr2 (SD7)
Tray3: Shutter solenoid /Fr3 (SD8), /Rr3 (SD9)

(2) Air mechanism in the sub scan direction

- The paper leading edge separation fans /Fr and /Rr are at the paper leading edge side. It blows the air to the paper leading edge to float and separate the paper.
Tray1: Paper leading edge separation fan /Fr1 (FM3), /Rr1 (FM4)
Tray2: Paper leading edge separation fan /Fr2 (FM7), /Rr2 (FM8)
Tray3: Paper leading edge separation fan /Fr3 (FM11), /Rr3 (FM12)
- The paper leading edge shutter is at the duct exit, and the paper leading edge shutter solenoid /1 (SD10), /2 (SD11), and /3 (SD12) [2] control the angle of blowing air.
- When SD10, SD11, and SD12 are OFF [3], it blows the air to the upper side of paper [5] to separate the paper.
- When SD10, SD11, and SD12 are ON [4], it blows the air from the leading edge side [1] to float the paper.

a0gdt2c007ca

[1] Air when it is ON	[2] Paper leading edge shutter solenoid /1 (SD10), /2 (SD11), /3 (SD12)
[3] Paper leading edge shutter when it is OFF	[4] Paper leading edge shutter when it is ON
[5] Air when it is OFF	-

- When the paper is floating with SD10, SD11, SD12 ON, the paper side guide shutter opens and increases the air volume with the shutter solenoids /Fr1 (SD4), /Rr1 (SD5), /Fr2 (SD6), /Rr2 (SD7), /Fr3 (SD8), and /Rr3 (SD9) turning OFF.
- When SD10, SD11, and SD12 are OFF, SD4, SD5, SD6, SD7, SD8, and SD9 turn ON and assist the separation by closing the paper side guide shutter and decreasing the air volume.
- This operation brings the stable floating, separation, and suction.

(3) Air volume control by paper

- The air volume control of the paper assist fans /Fr and /Rr and the paper leading edge separation fans /Fr and /Rr is automatically set by the paper type, the size and the weight in the following table. This setting can be set manually with the operation panel. The number 1 to 9 on the operation panel applies to 20% to 100%.

(4) Air-blow setting table by paper type

(a) Paper length: less than 160mm

Type of paper	Air-blow setting	Paper weight (g/m ²)									
		40 to 49	50 to 61	62 to 74	75 to 91	92 to 135	136 to 162	163 to 216	217 to 244	245 to 300	301 to 350

(g) For Envelope (1250/1250P/1052+EF-102)

Length of Envelope	Air-blow setting	Width of Envelope		
		138mm or less	138mm to 200mm	201mm or more
Less than 160mm	Edge	0	1	9
	Side	0	7	4
160mm to 182mm	Edge	0	1	9
	Side	0	7	4
182mm to 297mm	Edge	0	1	9
	Side	0	7	4
297mm or more	Edge	0	1	9
	Side	0	7	4
Less than 160mm	Edge	4	0	0
	Side	2	0	0
160mm or more	Edge	4	0	0
	Side	2	0	0

- When using the paper in the small size (paper width 138mm or shorter) or in the short size (paper length 160mm or shorter), apply 2 kinds of regulation sheets to enhance the feedability.
- For the short size, apply the regulation sheet /2 [2] to adjust the air volume. For the small size, apply the regulation sheet /1 [1] to regulate the paper floating.

Note

- For the small size, be sure to use not only the regulation sheet /1 but also the duct lock.
- Make sure to put the regulation sheet /1 in using the small-size paper.
- Make sure to put the regulation sheet /2 only when a trouble occurs in using the short-size paper.

a0gdt2c008ca

- Application basis of the regulation sheets /1 [1] and /2 [2]
 - Be sure to apply the position A as the basis.
 - Be sure that the sticking area of the sheet does not come out from the position B.

(5) Operation timing

- It explains the operation timing by taking the tray1 as an example.
- When receiving a print job [1], the paper leading edge separation fans /Fr1 (FM3), /Rr1 (FM4), the paper leading edge shutter solenoid /1 (SD10), and the paper feed assist fans /Fr1 (FM1), /Rr (FM2) turn ON and float the paper [2].

- When the paper suction sensors /Fr1 (PS25), /Rr1 (PS26) on the paper feed suction section turn ON with paper floating, SD10 turns OFF and the shutter solenoids /Fr1 (SD4) and /Rr1 (SD5) turn ON and decreases the air volume of the paper side guide [3] to separate the paper [4].
- For the 1st sheet, the conveyance by the paper feed belt starts [5] with the paper feed clutch /1 (CL7) turning ON after the specified time when the fan air volume gets stabilized.
- To assist the conveyance by the pre-registration roller nipping the paper, after the specified time when CL7 turns ON, SD10 turns ON again and SD4 and SD5 turn OFF [6] to float the 2nd sheet [7]. At this time, CL7 turns OFF [8] right after the operation to prevent the double feed.
- When the paper feed sensor /1 (PS2) detects the trailing edge of the 1st sheet, SD10 turns OFF and SD4 and SD5 turn ON to separate the 2nd sheet [9].
- FM1 and FM2 turn OFF when the image writing completes. FM3 and FM4 turn OFF when the printing completes.

a0gdt3e134ca

[1] Start button ON	[2] Floating paper
[3] Switch to paper separation air	[4] Separating paper
[5] Start of paper feed belt conveyance	[6] Switch to paper float air
[7] Floating 2nd paper	[8] Stop of double feed prevention
[9] Separation of 2nd paper	-

2.3.4 Paper empty detection control

- The paper empty sensors /1 (PS3), /2 (PS7) and /3 (PS11) detect the paper empty in the tray.

2.3.5 Remaining paper detection control

The remaining paper VR/1 (VR1), /2 (VR4) and /3 (VR7) that are interlocked through the pulley and the gear with the paper lift plate detects the remaining paper.

The remaining paper quantity is detected in the following 6 stages according to the resistance value, and the main body is informed of the detection.

(1) Tray1

- No Paper (↓ Flashing) : 0
- 1st step (displayed in yellow): 14.8% or less
- 1st step (displayed in white): 25% or less
- 2nd step (displayed in white): 50% or less
- 3rd step (displayed in white): 75% or less
- 4th step (displayed in white): 76% or more

(2) Tray2, 3

- No Paper (↓ Flashing) : 0
- 1st step (displayed in yellow): 10.8% or less
- 1st step (displayed in white): 25% or less
- 2nd step (displayed in white): 50% or less
- 3rd step (displayed in white): 75% or less
- 4th step (displayed in white): 76% or more

2.3.6 Tray lock control

- Each tray is locked by the tray lock lever.
- When it detects that either of the handle release sensors /1 (PS4), /2 (PS8) and /3 (PS12) of the trays 1 to 3 turns OFF, either of the tray lock solenoids /1 (SD1), /2 (SD2) and /3 (SD3) of the corresponding tray turns ON to bring up the tray lock lever and release the lock, thus allowing the tray to be pulled out.
- When it finds that any other sensor turns OFF while either of the sensors PS4, PS8 and PS12 is OFF, any of the solenoids SD1, SD2 and SD3 other than the one that has already turned ON does not turn ON. It prevents 2 or more trays from being pulled out at the same time.
- When a jam that affects the tray and the exit conveyance section occurs, the tray remains being locked until the jammed paper is removed. Doing this prevents the paper from being torn.

3. PAPER FEED SUCTION SECTION

3.1 Configuration

a0gdt2c009ca

[1]	Torque limiter	[2]	Paper suction sensor /Fr1 (PS25), /Fr2 (PS27), /Fr3 (PS29)
[3]	Paper suction sensor /Rr1 (PS26), /Rr2 (PS28), /Rr3 (PS30)	[4]	Actuator (paper suction detection)
[5]	Duct shutter	[6]	Paper suction fan /1 (FM13), /3 (FM15), /5 (FM17)
[7]	Paper suction fan /2 (FM14), /4 (FM16), /6 (FM18)	[8]	Paper feed belt
[9]	Suction duct		-

3.2 Drive

(1) Paper feed drive

a0gdt2c010ca

[1]	Paper feed suction unit /1	[2]	Paper feed suction unit /2
[3]	Paper feed suction unit /3	[4]	Paper feed belt motor (M2)
[5]	Paper feed clutch /1 (CL7), /2 (CL8), /3 (CL9)	[6]	Torque limiter
[7]	Paper feed belt	[8]	Coupling

(2) Paper feed suction/shutter drive

a0gdt2c011ca

[1] Paper suction fan /1 (FM13), /3 (FM15), /5 (FM17)	[2] Paper suction fan /2 (FM14), /4 (FM16), /6 (FM18)
[3] Shutter home sensor /1 (PS37), /2 (PS38), /3 (PS39)	[4] Suction shutter
[5] Suction duct	[6] Shutter motor /1 (M10), /2 (M11), /3 (M12)

3.3 Operation**3.3.1 Suction control****(1) Shutter operation**

- The inside of the paper feed suction duct is separated into 2 and the duct at the trailing edge side has the suction shutter.
- Shutter motors /1 (M10), /2 (M11), and /3 (M12) drive the suction shutter to control the absorption area.
- By closing the suction shutter to stop suctioning at the trailing edge side, it enables the suction applied to the paper size and prevents the double feed in the small size.
- When the shutter home sensors /1 (PS37), /2 (PS38), and /3 (PS39) turn ON, the suction shutter opens fully in a horizontal position to conduct the suctioning.

(2) Shutter control

- 2 kinds of controls are conducted depending on the paper size.

		Paper length in the sub scan direction		
		150mm or less	More than 150mm but less than 210mm	210mm or more
Paper length in the main scan direction	138mm or less	Control B	Control A	Control B
	138mm or more	Control A	Control A	Control B

(a) Control A

- When the start button is turned ON, the shutter motors /1 (M10), /2 (M11), and /3 (M12) turn ON from the position where the shutter home sensors /1 (PS37), /2 (PS38), and /3 (PS39) are ON (open), and turn OFF after specified time. They stop at the suction shutter close position and the paper is fed.

(b) Control B

- When the start button turns ON, the paper feed is conducted while PS37, PS38, and PS39 are at ON position (open).

(3) Suction fan control

- The paper suction fans /1 (FM13), /3 (FM15), /5 (FM17), /2 (FM14), /4 (FM16), /6 (FM18) turn ON when receiving a print job, and turn OFF when the printing completes.
- It does not control the rotation number of the suction fan.

3.3.2 Paper feed belt control**(1) Operation**

- The paper feed belt motor (M2) drives the paper feed belt via the paper feed clutches /1 (CL7), /2 (CL8), and /3 (CL9).

(2) Control

- It explains the operation timing by taking the tray1 as an example.
- When the start button turns ON, M2 turns ON [1].
- After the specified time [2] since the paper suction sensors /Fr1 (PS25), /Rr1 (PS26) turn ON, CL7 turns ON with suctioning paper and drives the paper feed belt to feed the paper [3].
- After the specified time since the pre-registration sensor /1 (PS14) detects the leading edge of paper, the pre-registration roller forms the loop to adjust the skew and CL7 turns OFF [4].
- After the specified time since it turns OFF, it turns ON again to assist the nipping of the pre-registration roller [5], and then it turns OFF.

- With this operation, the 2nd sheet of paper which already sticks to the paper feed belt is not conveyed by CL7 turning OFF. Only the 1st sheet of paper is conveyed [6] by the pre-registration roller /1 which already receives the drive from the paper feed motor (M1) by the pre-registration clutch /1 (CL1) turning ON.
- After the specified time since PS2 detects the trailing edge of the 1st sheet, CL7 turns ON again [7] to feed the 2nd sheet.
- When one of PS25 or PS26 is ON or when both of PS25 and PS26 are OFF, it stands by for specified time and CL7 does not turn ON. This is the standby to complete the suctioning.

4. VERTICAL CONVEYANCE SECTION

4.1 Configuration

a0gdt2c012ca

[1]	Pre-registration sensor /1 (PS14)	[2]	Pre-registration roller (Tray1)
[3]	Vertical conveyance sensor /1 (PS15)	[4]	Intermediate sensor /Up (PS16)
[5]	Horizontal registration roller	[6]	Loop sensor /1 (PS17)
[7]	Pre-registration roller (Tray2)	[8]	Loop sensor /2 (PS19)
[9]	Pre-registration sensor /2 (PS18)	[10]	Loop sensor /3 (PS23)
[11]	Intermediate sensor /Lw (PS22)	[12]	Vertical conveyance sensor /3 (PS21)
[13]	Pre-registration roller (Tray3)	[14]	Pre-registration sensor /3 (PS20)
[15]	Vertical conveyance door switch /Lw (SW2)	[16]	Vertical conveyance door switch /Up (SW1)

4.2 Drive

(1) Operation

a0gdt2c013ca

[1] Pre-registration clutch /1 (CL1)	[2] Intermediate clutch /1 (CL2)
[3] Torque limiter /Up	[4] Horizontal conveyance exit clutch (CL6)
[5] Pre-registration clutch /2 (CL3)	[6] Intermediate clutch /2 (CL4)
[7] Torque limiter /Lw	[8] Pre-registration clutch /3 (CL15)
[9] Paper feed motor (M1)	[10] Pre-registration roller /3 (Tray3)
[11] Intermediate conveyance roller /3	[12] Intermediate conveyance roller /2
[13] Pre-registration roller /2 (Tray2)	[14] Horizontal registration roller
[15] Intermediate conveyance roller /1	[16] Pre-registration roller /1 (Tray1)

4.3 Operation

4.3.1 Pre-registration control

- When the paper feed starts, paper is sent out to the pre-registration roller by the paper feed belt.
- When the paper strikes the pre-registration roller that is stopped, a loop is formed to adjust paper skew.
- When the pre-registration clutches /1 (CL1), /2 (CL3) and /3 (CL5) turn ON, the driving force of the paper feed motor (M1) is transmitted to the pre-registration rollers 1/, /2 and /3 to convey paper in the direction of the main body.

4.3.2 Conveyance control

- For the vertical conveyance, the driving force of the paper feed motor (M1) is transmitted by turning ON and OFF the intermediate clutches /1 (CL2) and /2 (CL4), and the pre-registration clutches /1 (CL1), /2 (CL3) and /3 (CL5).
- For the conveyance from the horizontal conveyance section, the driving force of the paper feed motor (M1) is transmitted by turning ON and OFF the horizontal conveyance exit clutch (CL6).
- Paper that is fed from tray1 is conveyed to the intermediate conveyance rollers /1 driven through the pre-registration roller /1 and CL2 which are driven by the CL1, and then conveyed to the exit conveyance roller. When the vertical conveyance roller /1 (PS15) detects the trailing edge of paper, CL2 turns off.
- Paper that is fed from tray2 is conveyed to the exit conveyance roller by the pre-registration roller /2 that is driven via CL3.
- Paper that is fed from tray3 is conveyed to the intermediate conveyance rollers /3 and /2 driven through the pre-registration roller /3 and CL4 which are driven by CL5, and then conveyed to the exit conveyance roller.
- When the vertical conveyance roller /2 (PS21) detects the trailing edge of paper, CL4 turns off.
- For the paper from the horizontal conveyance, CL6 turns ON when the horizontal conveyance sensor /5 (PS35) turns ON, and CL6 turns OFF when PS17 detects the trailing edge of the paper.
- A torque limiter is provided on the gear of each intermediate conveyance rollers /1 and /3.
- This prevents paper that is temporarily stopping on the vertical paper feed path from falling off the path and causing a paper jam.
- Since the line speed is different between PF and PI-PFU, the rotation number of the paper feed motor (M1) varies.

PF: 1943.3rpm

PI-PFU: 1559.4rpm

5. EXIT CONVEYANCE SECTION

5.1 Configuration

a0gdt2c014ca

[1] PF exit conveyance sensor	[2] PF paper exit roller
-------------------------------	--------------------------

5.2 Drive

(1) PF exit conveyance drive

a0gdt2c015ca

[1] PF exit conveyance motor (M3)	[2] PF paper exit roller
[3] Front side	-

5.3 Operation

5.3.1 Exit conveyance control

- The PF paper exit roller is driven by the PF exit conveyance motor (M3). It starts to rotate at a fixed speed when the loop sensors /1 (PS17), 2/ (PS19) and /3 (PS23) detect paper, and turns OFF when the PF exit sensor (PS24) detects the trailing edge of paper.

6. ENTRANCE CONVEYANCE SECTION

6.1 Configuration

[1]	Front side	[2]	Entrance conveyance roller /Up
[3]	Entrance conveyance roller /Lw	-	

6.2 Drive

(1) Entrance conveyance drive

[1]	Coupling conveyance motor /1 (M4)	[2]	Rotation direction when PF
[3]	Entrance conveyance roller /Lw	[4]	Entrance conveyance roller /Up
[5]	Rotation direction when PI-PFU	-	

6.3 Operation

6.3.1 Entrance conveyance control

- The rotation direction of the coupling conveyance motor /1 (M4) is different between multiple PF and PI-PFU since the conveyance paths of them are different.

(1) Control in the case of multiple PF

- The coupling conveyance motor /1 (M4) conveys at a constant speed of 1250mm/s.

(2) Control in the case of PI-PFU

(a) Main body straight paper exit

- The coupling conveyance motor /1 (M4) speeds up to , 1000mm/s after specified time (the specified time is depending on main body paper exit 570mm/s, 490mm/s, or 330mm/s) since the paper exit sensor (PS3) of the main body detects the leading edge and turns ON.

(b) Main body reverse paper exit

- The coupling conveyance motor /1 (M4) conveys at a constant speed of 1250mm/s.

7. HORIZONTAL CONVEYANCE SECTION

7.1 Configuration

a0gdt2c018ca

[1]	Horizontal conveyance roller /1	[2]	Horizontal conveyance roller /2
[3]	Horizontal conveyance roller /3	[4]	Horizontal conveyance roller /4
[5]	Horizontal conveyance roller /5	[6]	Horizontal conveyance roller /5 (PS35)
[7]	Horizontal conveyance roller /4 (PS34)	[8]	Horizontal conveyance roller /3 (PS33)
[9]	Horizontal conveyance roller /2 (PS32)	[10]	Horizontal conveyance roller /1 (PS31)

7.2 Drive

(1) Horizontal conveyance drive

a0gdt2c019ca

[1] Coupling conveyance motor /2 (M5)	[2] Coupling
[3] Horizontal conveyance roller /1	[4] Horizontal conveyance roller /2
[5] Horizontal conveyance roller /3	[6] Horizontal conveyance roller /4
[7] Horizontal conveyance roller /5	[8] Coupling
[9] Coupling conveyance motor /3 (M6)	-

7.3 Operation

7.3.1 Horizontal conveyance control

- Since the horizontal conveyance section is unified with the tray1, the tray1 cannot be pulled out during the horizontal conveyance.

(1) Control in the case of multiple PF

- The coupling conveyance motors /2 (M5) and /3 (M6) convey at a constant speed of 1250mm/s.

(2) Control in the case of PI-PFU

(a) Main body straight paper exit

- When the paper length in the sub scan direction is 217mm or longer in main body straight page exit, the coupling conveyance motor /2 (M5) speeds up to, 1000mm/s after specified time (the specified time is depending on main body paper exit 570mm/s, 490mm/s, or 330mm/s) since the paper exit sensor (PS3) detects the leading edge and turns ON.
- The coupling conveyance motor /3 (M6) conveys at a constant speed of 1000mm/s.

(b) Main body reverse paper exit

- The coupling conveyance motors /2 (M5) and /3 (M6) starts at 1000mm/s and speeds up to 1250mm/s to accommodate to the speed of main body paper exit when the paper exit sensor (PS3) of the main body turns ON and detects the leading edge of the 1st sheet.
- It slows down to 1000mm/s when the horizontal conveyance sensor /5 (PS35) turns ON and detects the leading edge of the paper.
- When the paper trailing edge of the 1st sheet turns OFF PS35, M6 increases the speed to 1250mm/s again.
- When the paper leading edge of the 2nd sheet turns ON the horizontal conveyance sensor /1 (PS31), M5 increases the speed to 1250mm/s again.

8. HT-505 (OPTIONAL)

8.1 Configuration

a0gdt2c020ca

[1] Temperature sensor /5 (TEMS/5), /6 (TEMS/6), /7 (TEMS/7)	[2] Dehumidifier fans /Rt1 (FM22), /Rt2 (FM24), /Rt3 (FM26)
[3] Dehumidifier fan /Lt1 (FM23), /Lt2 (FM25), /Lt3 (FM27)	[4] Dehumidification heaters /1 (HTR1), /2 (HTR2), /3 (HTR3)
[5] Dehumidifier fan heater unit /3	[6] AC drive board /2 (ACDB/2)
[7] Dehumidifier fan heater unit /2	[8] Dehumidifier fan heater unit /1

8.2 Operation

8.2.1 Dehumidifier fan heater control

- 2 units of HT can be installed to PF at maximum. 4 units of HT can be installed to the coupling of 2 PF at maximum (up to 2 units for each PF).
- 6 units can be installed in total if HT is installed to PI-PFU, but ON setting (automatic/forced ON) is available to 4 units at maximum.
- The following order is the priority of ON setting, when 6 units of HT are installed.
 - PFU1 > PFU2 > PI-PFU
 - Tray1 > Tray2 > Tray3
- In this case, [Dehumidify Mode Setting] of PFU1 and PFU2 turns to [Auto] and [Dehumidify Mode] of PI-PFU turns to [Forced Off].
- At this time, [Auto] and [Forced On] of PI-PFU is unselectable.
- However, when [Dehumidify Mode] is set to [Forced Off] on one of the trays of PFU1 or PFU2, [Dehumidify Mode] can be changed to [Auto] or [Forced On] on the tray of PI-PFU.

(1) Dehumidifier fan heater preliminary dry control

- The dehumidification heaters /1 (HTR1), /2 (HTR2), and /3 (HTR3) and the dehumidifier fans /Rt1 (FM22), /Lt1 (FM23), /Rt2 (FM24), /Lt2 (FM25), /Rt3 (FM26), and /Lt3 (FM27) control the dehumidifying with the hot air circulation and prevent the jam occurred in paper feed section.
- When the temperature-humidity sensor (TEM/HUMS) of PF detects the outer humidity 56% or more, HTR1, HTR2, HTR3, and FM22, FM23, FM24, FM25, FM26, FM27 turn ON.
- It can control "Paper Feed Wait during Pre-Drying" from [UTILITY] - [Function Setting] - [PFU Preliminary Dry Setting].

The following table shows the operations.

Setting	Paper feed operation
None	It does not conduct the print wait operation for the preliminary dry. It starts the paper feed operation if it is in the print wait condition.
Provided	When the sub power switch (SW2) turns ON and when the tray is set, it conducts the paper feed wait operation for the preliminary dry. It takes about 6 minutes to 10 minutes for the paper feed wait.

(2) Start condition of the dehumidification mode control

- The dehumidification control can be set to [Auto], [Forced On], or [Forced Off] from [MACHINE] - [Tray Setting] - [Dehumidify Mode Setting].
- The following table shows the operations.

Dehumidify Mode Setting	Paper Feed Wait during Pre-Drying	Paper feed operation
Automatic	None	It conducts the dehumidification heater/ dehumidification fan control by the humidity which the temperature-humidity sensor (TEM/HUMS) detects. However, it does not conduct the paper feed wait during pre-drying.
	Provided	It conducts the dehumidification heater/ dehumidification fan control by the humidity which TEM/HUMS detects. When the sub power switch (SW2) turns ON or when the tray is set, it conducts the paper feed wait during pre-drying depending on the detected humidity.

Forced On	None	It conducts the dehumidification heater/ dehumidification fan control regardless of the detected humidity by TEM/HUMS. It does not conduct the paper feed wait during pre-drying.
	Provided	It conducts the dehumidification heater/ dehumidification fan control regardless of the detected humidity by TEM/HUMS. When SW2 turns ON or when the tray is set, it conducts the paper feed wait during pre-drying depending on the detected humidity.
Forced Off	-	It does not conduct the dehumidification heater/ dehumidification fan control nor the paper feed wait during pre-drying.

(3) Operation contents

- The print operation of the corresponding tray differs depending on the setting of "Paper Feed Wait during Pre-Drying" during dehumidification control.

Outer humidity	Paper feed wait control time
55% or less	0 minute
56% to 60%	6 minutes
61 to 65%	
66 to 70%	8 minutes
71 to 75%	
76% or more	10 minutes

(4) Stop condition of the dehumidification mode control

- When the dehumidify mode setting is changed to [Forced Off] during dehumidification control.

9. FA-501 (OPTIONAL)

9.1 Configuration

a0gdt2e021ca

[1]	PF exit conveyance sensor /2 (PS36)	[2]	Multi feed detection board /R (MFDBR)
[3]	PF exit conveyance sensor /1 (PS24)	[4]	Multi feed detection board /S (MFDBS)

---	--------------------

2.3 Operation

2.3.1 Up/down control

(1) Up operation

- The paper lift motors /1 (M42), /2 (M43) and /3 (M44) wind up the lift wires through the pulleys to lift up the paper lift plate.

(2) Down operation

- When pulling out the tray, the coupling gear [2] that transmits the drive force from the motor shaft [3] to the pulley [1] is detached by the release lever [4].
- The paper lift plate goes down slowly by its own weight through the torque restriction gear [5] that is activated only while in the down operation.

pf701to2005d

[1] Pulley	[2] Coupling gear
[3] Motor shaft	[4] Release lever
[5] Torque restriction gear	-

(3) Operation timing

- When the tray is set, the paper lift motors /1 (M42), /2 (M43) and /3 (M44) turn ON to raise the paper lift plate.
- When the upper limit sensors /1 (PS2), /2 (PS6), and /3 (PS10) turns ON, M42, M43, and M44 stop.

- When the sensors PS2, PS6 and PS10 turn OFF from ON during printing, the motors M42, M43 and M44 turn ON again to bring up the paper lift plate until the sensors PS2, PS6 and PS10 turn ON, and the motors M42, M43 and M44 turn OFF.

2.3.2 Size detection control

There are 2 types of the paper size detection: detection in the main scan direction and detection in the sub scan direction.

(1) Detection mechanism

- The FD paper size VR/1 (VR3), /2 (VR6), /3 (VR9) detect the paper size in the sub scan direction. The FD paper size VR is interlocked with the paper rear guide through the link wire.
- The CD paper size VR/1 (VR2), /2 (VR5), /3 (VR8) detect the paper size in the sub scan direction. The CD paper size VR is interlocked directly with the paper guide.
- After a specified period of time since the tray is set to PF, each VR informs the detected size data to the control program of the main body. For the resistance value, a default is set by "Tray Adjustment" in the service mode.
- For the paper sizes shown below, it is necessary to set the paper size in the user mode, selecting [Tray Setting] - [Size Setting] - [Detection Size Setting].
 - A5, $5\frac{1}{2} \times 8\frac{1}{2}$
 - 8×13 , $8\frac{1}{4} \times 13$, $8\frac{1}{2} \times 13$, $8\frac{1}{8} \times 13\frac{1}{4}$, or $8\frac{1}{2} \times 14$
 - SRA3, 12×18

a0gct2c002ca

[1] Paper guide	[2] Paper rear guide
[3] CD paper size VR/1 (VR2), /2 (VR5), /3 (VR8)	[4] Link wire
[5] FD paper size VR/1 (VR3), /2 (VR6), /3 (VR9)	-

2.3.3 Pick-up mechanism

- The pick-up solenoids /1 (SD4), /2 (SD5) and /3 (SD6) turn OFF to pick up the paper.
- When the solenoids SD4, SD5 and SD6 turn OFF, the pick-up roller goes down to press paper by its own weight.
- When the paper feed clutches /1 (CL6), /2 (CL9) and /3 (CL12) turn ON, the pick-up roller rotates to convey the paper to the paper feed roller.

pf701to2007e

[1] Start button ON	[2] Pick-up of the 1st sheet of paper
[3] Conveyance of the 1st sheet of paper	[4] Pick-up of the 2nd sheet of paper
[5] Conveyance of the 2nd sheet of paper	-

2.3.4 Separation mechanism

- For the transmission of the drive force to the separation roller [4], the drive force of the paper feed motor (M1) is transmitted by the ON/OFF operation of the separation clutches /1 (CL7), /2 (CL10) and /3 (CL13) [8] through the torque limiter [7].
- The drive force can be transmitted directly, not through the torque limiter [7], to the separation roller by the ON/OFF operation of the forced separation clutches /1 (CL8), /2 (CL11) and /3 (CL14) [5].
- The separation roller [4] is driven in the direction opposite to the paper conveyance. However, when no paper is conveyed and only 1 sheet of paper is conveyed, the frictional force generating between the paper feed roller [1] and the separation roller [4] or the paper and the separation roller is greater than the frictional force of the torque limiter [3]. Accordingly, the separation roller rotates in the direction of the paper conveyance to convey paper to the vertical conveyance section.
- When 2 or more sheets of paper are conveyed, the frictional force between these sheets of paper is smaller than the frictional force of the torque limiter and the separation roller rotates in the reverse direction to prevent the lower most paper from being conveyed.

- When paper is slippery, it rotates the separation roller [4] momentarily in the reverse direction independent of the torque limiter [7] for greater separation of paper.

a08r12c003cb

[1]	Pick-up roller	[2]	1st sheet of paper
[3]	2nd sheet of paper	[4]	Separation roller
[5]	Forced separation clutch /1 (CL8), /2 (CL11), /3 (CL14)	[6]	Torque limiter
[7]	Forced separation clutch /1 (CL7), /2 (CL10), /3 (CL13)	[8]	Paper feed roller

(1) Separation clutch control

- When paper is slippery (or, when the power for conveyance is insufficient), paper conveyed from the pick-up roller may be unable to pass through the handling sections of the paper feed roller and the separation roller.
 - To alleviate this kind of condition, turn OFF the separation clutches /1 (CL7), /2 (CL10) and /3 (CL13) until paper gets to the handling section to cut off the drive force to the separation roller, and make it function as a driven roller to the paper feed roller. After paper gets to the handling section, turn ON the CL7, CL10 and CL13 to conduct the normal separation operation.
 - This control is made unconditionally for the 1st sheet of paper. For the 2nd and the succeeding sheets of paper, the control is made as follows.
 - Type of paper: Preprinted paper: Made unconditionally.
 - Type of paper: Other than Preprinted paper: Made automatically judging from the condition of conveyance at the handling section. ^{*1}
- ^{*1} For the paper type other than the coated paper, the DIPSW39-2/3/4/5/6/7:1 enables the control unconditionally. At this time, the control is made unconditionally for the coated paper only in the low temperature.
Set the DIPSW 39-2/3/4/5/6/7 to "1" corresponding to the selected tray .

(2) Forced separation clutch control

- If the paper is slippery, when paper is conveyed to the separation roller, it rotates the separation roller momentarily in the reverse direction independent of the torque limiter for greater separation of paper.
- This control is automatically made only in the high temperature condition for the coated paper and the preprinted paper more than 72g/m².
However, the DIPSW26-4 can be used to select only for a high temperature as a condition for control.

2.3.5 Paper dust removing mechanism

- This mechanism is provided to remove paper dust from the paper feed roller.
- Paper dust adhered to the paper feed roller is removed by the paper dust removal brush (raising brush) and transferred to the scraper shaft (metal roller). Then the scraper (sheet) scrapes off the paper dust from the shaft.

2.3.6 Air assist mechanism

- Trays1 to 3 are provided with paper feed assist fans that blow air [4] onto paper [3] from a pair of paper guides attached both in front and in the rear and assist the separation of paper.
- The tray1 is provided with the paper feed assist fans /Fr1 (FM1) [2] and /Rr1 (FM2) [1], the tray2 with paper feed assist fans /Fr2 (FM3) [2] and /Rr2 (FM4) [1], and tray3 with paper feed assist fans /Fr3 (FM5) [2] and /Rr3 (FM6) [1].
- Each of the paper feed assist fans is effective especially for thick paper, and paper with a high degree of adhesion (such as coated paper). However, in the case of plain paper, it may not be fed smoothly.

pf701to2010c

[1]	Paper feed assist fan /Rr1 (FM2), /Rr2 (FM4), /Rr3 (FM6)	[2]	Paper feed assist fan /Fr1 (FM1), /Fr2 (FM3), /Fr3 (FM5)
[3]	Paper	[4]	Blow-out of air

(1) Operation timing

- The operation of the paper feed assist fans /Fr1 (FM1), /Rr1 (FM2), /Fr2 (FM3), /Rr2 (FM4), /Fr3 (FM5) and /Rr3 (FM6) can be selected among the following 3 modes in the user mode, selecting [Tray Setting] - [Air Assist].
- Always ON, Always OFF and Auto.
- While in the Auto mode, the paper feed assist fan is normally turned OFF, but when the coated paper or the preprinted paper is selected for the type of paper on the operation panel, the paper feed assist fan of the corresponding tray is turned ON.

2.3.7 Paper empty detection control

- The paper empty sensors /1 (PS4), /2 (PS8) and /3 (PS12) detect the paper empty in the tray.

2.3.8 Remaining paper detection control

- The remaining paper VR/1 (VR1), /2 (VR4) and /3 (VR7) that are interlocked through the pulley and the gear with the paper lift plate detects the remaining paper.
- The remaining paper quantity is detected in the following 6 stages according to the resistance value, and the main body is informed of the detection.
 - No Paper (↓ Flashing) : 0
 - 1st step (displayed in red): 10% or less
 - 1st step (displayed in white): 25% or less
 - 2nd step (displayed in white): 50% or less
 - 3rd step (displayed in white): 75% or less
 - 4th step (displayed in white): 76% or more

pf701to2011c

[1]	Remaining paper VR /1 (VR1), /2 (VR4), /3 (VR7)	[2]	Lift pulley /Rr
-----	---	-----	-----------------

2.3.9 Tray lock control

- Each tray is locked by the tray lock lever.
- When it detects that either of the handle release sensors /1 (PS5), /2 (PS9) and /3 (PS13) of the trays 1 to 3 turns OFF, either of the tray lock solenoids /1 (SD1), /2 (SD2) and /3 (SD3) of the corresponding tray turns ON to bring up the tray lock lever and release the lock, thus allowing the tray to be pulled out.
- When it finds that any other sensor turns OFF while either of the sensors PS5, PS9 and PS13 is OFF, any of the solenoids SD1, SD2 and SD3 other than the one that has already turned ON does not turn ON. It prevents 2 or more trays from being pulled out at the same time.
- When a jam that affects the tray and the exit conveyance section occurs, the tray remains being locked until the jammed paper is removed. Doing this prevents the paper from being torn.

[17]	Torque limiter	[18]	Intermediate clutch /Up (CL2)
[19]	Pre-registration clutch /1 (CL1)	[20]	Pre-registration roller /3

3.3 Operation

3.3.1 Pre-registration control

- When the paper feed starts, paper is sent out to the pre-registration roller by the pick-up roller and the paper feed roller.
- When the paper strikes the pre-registration roller that is stopped, a loop is formed to adjust paper skew.
- When the pre-registration clutches /1 (CL1), /2 (CL3) and /3 (CL5) turn on, the driving force of the paper feed motor (M1) is transmitted to the pre-registration rollers 3/, /4 and /5 to convey paper in the direction of the main body.

3.3.2 Conveyance control

- For the vertical conveyance, the driving force of the paper feed motor (M1) is transmitted by turning on and off the intermediate clutches /Up (CL2) and /Lw (CL4), and the pre-registration clutches /1 (CL1), /2 (CL3) and /3 (CL5).
- The PF exit conveyance motor (M2) operates the exit conveyance.
- Paper that is fed from tray1 is conveyed to the conveyance rollers /1 and /2 driven through the pre-registration roller /3 and CL2 that are in turn driven by the CL/1, and then conveyed to the exit conveyance roller. When the loop sensor /1 (PS17) detects the trailing edge of paper, the CL2 turns OFF.
- Paper that is fed from tray 2 is conveyed to the exit conveyance roller by the pre-registration roller /4 that is in turn driven by the CL3.
- Paper that is fed from tray /3 is conveyed to the conveyance rollers /5 and /3 through the pre-registration roller /5, CL4 that is in turn driven by the CL/4, and then conveyed to the exit conveyance roller. When the loop sensor /3 (PS23) detects the trailing edge of paper, the CL4 turns OFF.
- The exit conveyance roller is driven by the PF exit conveyance motor (M2). It starts to rotate at a low speed when the loop sensors /1 (PS17), 2/ (PS19) and /3 (PS23) detect paper, and turns off when the PF exit conveyance sensor (PS24) detects the trailing edge of paper.
- A torque limiter is provided on the gear of each conveyance roller /1 and /4 to prevent the rollers from rotating when the clutches are released. This prevents paper that is temporarily stopping on the vertical paper feed path from falling off the path and causing a paper jam.

4. OTHERS

4.1 Dehumidification heater control

- Trays1 to 3 are provided with the dehumidification heaters /1 (HTR/1), /2 (HTR2) and /3 (HTR3), 1 each respectively, below each tray. They are turned on when the dehumidification heater switch (SW3) of the main body is turned ON.

pf701to2014c

[1]	Dehumidification heater /1 (HTR1)	[2]	Dehumidification heater /2 (HTR2)
[3]	Dehumidification heater /3 (HTR3)	-	

4.2 Main body temperature rise prevention assist mechanism

- To enhance cooling in the main body, air drawn by the PF cooling fan (FM7) is distributed inside the main body.

5.2 Operation

- The paper trailing edge separation fans /1 (FM8), /2 (FM9) and /3 (FM10) [1] provided on the right side of the PF blow air [2] to the stacked papers to assist the paper separation.
- Operating timing of FM8, FM9, FM10 are the same that of the paper feed assist fans provided inside the tray.
- Urethane rollers are used for feeding papers for overprinting since urethane is less affected by powders used for overlay printing.
- The assist fans [3] and urethane rollers ensure paper feed accuracy when overlay printing.

2. PAPER FEED SECTION

2.1 Drive

2.1.1 Paper feed drive

2.1.2 Pick-up drive

2.2 Operation

2.2.1 Paper feed control

(1) Pick-up control

- The pick-up solenoids (SD100) turn OFF to pick up the paper.
- When SD100 turns OFF [2], the pick-up roller descends and presses the paper with its own weight.
- Then the paper feed clutch (CL101) turns ON [3] to transmit drive force of the paper feed motor (M101) to the pick-up roller, and the pick-up roller starts to rotate and picks up a sheet of paper to be fed by the paper feed roller.
- Paper feed roller rotates with the pick-up roller so that the paper is conveyed to the pre-registration roller.
- When the pre-registration sensor (PS107) provided short of the pre-registration roller turns ON [4], the SD100 also turns ON to evacuate the pick-up roller, and then it turns OFF CL101 after a specified period of time to stop the rotation of the paper feed roller and the pick-up roller.
- When the 1st sheet of paper turns OFF [5] after passing through PS107, SD100 also turns OFF to let the pickup roller go down and pick up [6] the 2nd sheet of paper.

[1] Start button ON	[2] Pick-up roller presses paper with its own weight.
[3] Drive force transmission to the pick-up roller and paper feed roller.	[4] Pick-up roller separates from loaded paper
[5] Pick-up roller goes down	[6] Pick-up of the 2nd sheet of paper

(2) Separation mechanism

- Papers are separated by the separation roller [5].
- The separation roller [5] rotates in the direction [10] opposite to the paper conveyance direction [9] by means of the torque limiter [8]. The roller is pressed against the paper feed roller by force exerted by the spring [7] and the torque limiter.
- The friction force between the separation roller and the paper feed roller is limited by the torque limiter in order to prevent multi-feed.
- When no paper exists between the separation roller and the paper feed roller or when the only one sheet of paper is present, the separation roller is driven by the paper feed roller in the direction of arrow [4] since the torque is over the limit.
- When multiple sheets of paper are fed, the separation roller reverses the direction of rotation [10] (opposite to the paper feed roller) and feeds the lower paper [2] that contacts with the separation roller back to the tray [3]. The drop in frictional force between the two rollers due to the multiple sheets causes the counter rotating of the separation roller.

[1] Paper feed roller	[2] 2nd paper
[3] Tray direction	[4] Driven rotation
[5] Separation roller	[6] Pressure
[7] Spring	[8] Torque limiter
[9] Conveyance direction	[10] Rotation in separation direction

(3) Pre-registration control

- The pre-registration roller is driven by the paper feed motor (M101) via the pre-registration clutch (CL102).
- M1 drive force is transmitted/shut off by CL102 to rotate/stop the roller.
- Paper fed by the paper feed roller hits against the pre-registration roller that is stopping due to the off-status [2] of CL102, and the skew of paper is corrected.
- Then, after a predetermined time period has elapsed, CL102 turns on [3] to rotate the pre-registration roller to convey the paper.
- At this time, the paper feed clutch (CL101) turns ON [4] for a short period of time to rotate the feed roller to assist the conveyance until the pre-registration roller nips the paper securely.

[1] Start button ON	[2] Skew corrected by forming a loop
---------------------	--------------------------------------

[3] Paper conveyance into the main body

[4] Paper conveyance assisted

2.2.2 Paper empty detection control

- A paper empty status can be detected by on/off statuses of the upper limit sensor (PS109) [6] and the paper empty sensor (PS108) [1].
- When the paper lift plate [4] goes up while paper is on the tray, the paper pushes up the actuator [2] and then the PS108 [1] are turned off.
- When it goes further up, the actuator [5] is pushed up to turn ON PS109 [6].
- When there remains no paper, the actuator [2] gets in the hole [3] of the paper lift plate [4] and it cannot be pushed up, and as a result, the actuator [5] only is pushed up to allow PS109 [6] to turn ON.
- If only PS109 turns ON, it is determined that the paper is empty and the main body displays the message on its operation panel.
- While in the paper feed operation, PS108 turns OFF from ON with PS109 ON to detect a paper empty condition.

[1] Paper empty sensor (PS108)	[2] Actuator of PS108
[3] Hole	[4] Paper lift plate
[5] Actuator of PS109	[6] Upper limit sensor (PS109)

2.2.3 Remaining paper detection control

- The remaining amount of paper is detected by the position of the remaining paper detection gear [6] moved together with the shaft [5] of the paper lift motor (M100) which drives the paper lift plate.
- The remaining paper detection gear incorporates the actuator [7], and the actuator position is detected by the 4 remaining paper sensors; /1 (PS102) [1], /2 (PS103) [2], /3 (PS104) [3], and /4 (PS105) [4].
- According to on/off statuses of the 4 sensors, the remaining amount of paper can be figured out.
 - LU-409

[1] Remaining paper sensor /1 (PS102)	[2] Remaining paper sensor /2 (PS103)

[11] Front side direction	[12] Paper lift plate

3.2 Operation

3.2.1 Up/down control

- Moving the paper lift plate up/down is made by winding/releasing the lift wires with the pulleys driven by the paper lift motor (M100).
- The paper lift plate is tied up with four lift wires each at front and rear. The lift wires /Fr3, /Fr4, /Rr3 and /Rr4 are tied in the direction in which the paper lift plate is brought up, and the lift wires /Fr1, /Fr2, /Rr1 and /Rr2 tied in the direction in which it is brought down.
- When the paper lift plate is brought up, the lift wires /Fr3, /Fr4, /Rr3 and /Rr4 are wound up around the pulley, and each two lift wires /Fr1, /Fr2, /Rr1 and /Rr2 at front and rear are wound off from the pulley.
- When it is brought down, the lift wires that were wound up while it was brought up are wound off and the lift wire that were wound off while it was brought up are wound up to bring down the paper lift plate.

(1) Up operation

- When the upper door open/close sensor (PS100) turns ON [1] with the upper door closed, the paper lift motor (M100) also turns ON (in normal rotation) to bring up [2] the paper lift plate.
- M100 turns OFF when the paper lift plate turns the upper limit sensor (PS109) ON [3].
- While in the print operation, when PS109 turns OFF [4] from ON due to the insufficient height of paper caused by paper being fed, M100 turns ON again (in normal rotation).
- The paper lift plate goes up, and M100 turns OFF when PS109 turns on [5].
- This up operation of the paper lift plate is repeated for each sheet of paper that is fed.

15sst2e010na

[5]	Paper lift plate reaches the upper limit position	[6]	Feed of the 1st sheet of paper
[7]	Feed of the 2nd sheet of paper	-	

(2) Down operation

- The upper door open/close sensor (PS100) turns OFF [1] by opening the upper door. At this time, the paper lift motor (M100) turns ON (in reverse rotation) and the paper lift plate goes down.
- When the paper lift plate goes down about 120mm, M100 turns OFF and stop [2].
- When the tray down switch (SW100) is pressed [3] with the upper door open, M100 turns ON and the paper lift plate goes down about 120mm.
- The paper lift plate goes down about 120mm each time SW100 is pressed until the lower limit sensor (PS101) turns ON.
- Even SW 100 is pressed, the paper lift plate does not go down [6] after PS10 turns ON [5] at the lower limit position.

[1]	Closing of upper door	[2]	Stop of the paper lift plate
[3]	Start of the down operation when SW100 turns ON	[4]	120 mm down
[5]	Stop at the lower limit position	[6]	Disregard of SW100 being turned ON when PS101 turns ON

4. OTHERS

4.1 Dehumidification heater control

- The LU is equipped with the dehumidification heater (HTR101) to reduce the moisture inside the LU.
- HTR101 is provided with AC200 to 240 V from the main body, and the dehumidification heater switch (SW3) of the main body turns ON/OFF HTR101.

4.2 Interlock switch control

- The front door interlock switch (MS101) and the front door open/close sensor (PS110), and the upper door interlock switch (MS102) and the upper door open/close sensor (PS100) are provided in the inside of the LU.
- The power source of the paper feed motor (M101) is supplied through MS101 and MS102. When the front door or upper door is opened, MS101 or MS102 turns OFF to shut off the power supply to M101.
- When PS110 or PS100 turns OFF while in the paper feed operation, the LU drive board (LUDB) turns OFF a drive signal to M101 to stop the paper feed operation.

PE THEORY OF OPERATION EF-102

1. OUTLINE

1.1 Way to distinguish the fusing unit between 1250/1052/951 and EF-102.

Note

- The fusing unit of 1250/1052/951 and the fusing unit of EF-102 differs whether it has envelope label or not, which direction to rotate the jam release knob, and whether it has separation claw /Up, /Lw or not.
- EF-102 is provided with the envelope label [1].
- The jam release knobs of EF-102 [2] and 951 [4] rotate both clockwise and counterclockwise.
- The jam release knob [3] of 1250/1052 rotates only clockwise.
- EF-102 is not equipped with the separation claws /Up and /Lw.

2.2 Drive

2.2.1 Fusing roller/web drive

For details, refer to [O.14.2.1 Fusing roller/web drive](#).

2.2.2 Fusing roller /Lw pressure drive

For details, refer to [O.14.2.2 Fusing roller /Lw pressure drive \(1250/1250P/1052 only\)](#).

2.3 Operation

2.3.1 Fusing roller drive control

(1) Speed changeover control

- The process speed is controlled with 1 step at 330mm/s.

(2) Preparative rotation control

(a) Control when the power is turned ON

- When the fusing temperature is less than 50°C with the sub power switch (SW2) turned ON and the detection temperature of the fusing temperature sensor /1 (TH1) of the fusing roller /Up gets to a specified temperature, the fusing motor (M1) starts the preparatory rotation and stops after a specified period of time or when the TH1 detects a specified temperature.
- When the fusing temperature is between 50°C or more and less than 185°C with the SW2 turned ON or while in warm-up after cleaning jam and the detection temperature of the TH1 of the fusing roller /Up gets to a specified temperature, the M1 starts the preparatory rotation. Then, the M1 stops after a specified period of time or when the TH1 detects a specified temperature.

- The software DIPSW8-2/3 allows you to make a selection between the execution and the non-execution of this preparatory rotation. Also the software DIPSW8-4/5 allows you to change the length of the preparatory rotation time.

(b) Print control

- It conducts the preparatory rotation for a specified period of time before the printing starts.
- The length of the preparatory rotation time is previously specified in accordance with the type of paper and the paper weight.
- It does not conduct the preparatory rotation when the next printing starts within 3 seconds after the previous printing.

(c) Control while in idling

- The M1 stops while in idling, however, it conducts the preparatory rotation when the prescribed condition is met.
- The preparatory rotation is conducted for a specified period of time when the TH1 detects 230°C or more while in idling.
- The preparatory rotation is conducted for a specified period of time when the fusing temperature sensor /2 (TH2) detects 220°C or more.
- When a print is reserved while in idling, the preparatory rotation is not conducted even when the TH1, TH2 detect the temperature which is the condition to start the preparatory rotation.
- When a print is executed during the preparatory rotation while in idling, the preparatory rotation is stopped for the print.

(3) Speed stabilization

- To stabilize the speed, the gear shaft between the M1 and the fusing roller /Up is equipped with a flywheel. The inertia force of the flywheel stabilizes the speed of the fusing roller to minimize the transfer jitter on thick paper.

2.3.2 Pressure release drive control

(1) Purpose

- The pressure release control of the fusing roller /Lw enhances the following performance.
 - Enhancement of the durability of the fusing roller /Up and fusing roller /Lw.
 - Reducing the curl amount and enhancement of fusibility in printing.
 - Warming up of the fusing roller /Lw in the warm-up preparatory rotation.
 - Improvement of the productivity and the durability of the pressure release mechanism.

(2) Operation

(a) Pressure position

- The pressure position has 5 types of position 1 to 5.
- Pressure position 4 is usually used when printing.
- Pressure position 1 "Very strong" can be set to be used in software DIPSW setting, however it is not usually used.

Pressure position	Position 1	Position 2	Position 3	Position 4	Position 5
Pressure power	Very strong	Strong	Medium	Weak	Very weak

(b) During the preparatory rotation in warming-up

- The pressure position switches to the position 4. The pressure position switches to the position 5 after the pre-rotation.

(c) When starting the printing

- The pressure position switches to the printing position at the same time the preparatory rotation for the printing starts.

(d) While in the print

- After the print completes, it keeps the current pressure position for the next print. When there is no next job input, the pressure position switches to the pressure position (position 5).

(e) Switching of the pressure position

- Pressure position 4 is usually used when printing, but other pressure positions can also be used by setting [Tray Setting]-[Pressure Power Setting].

2.3.3 Web drive control

For details, refer to [O.14.3.3 Web drive control](#).

2.3.4 Fusing temperature control

- The heating of the fusing roller /Up is made by the fusing heater lamps /1 (L1) and /2 (L2) and the heating of the fusing roller /Lw made by the fusing heater lamp /3 (L3) through the fusing heating roller.
- The surface temperature of the fusing roller /Up is detected at fixed intervals by thermistor /1 (TH1) [1] provided at the center, and controlled by turning L1 and L2 ON/OFF through the AC drive board (ACDB) so that it becomes a prescribed temperature.
- The surface temperature of the fusing heating roller is detected at fixed intervals by fusing temperature sensor /3 (TH3) [2] provided at the center and the temperature of the fusing heating roller is controlled by turning L3 ON/OFF via ACDB.

[1]	Fusing temperature sensor /1 (TH1)
[2]	Fusing temperature sensor /3 (TH3)

(1) Warm-up

- The fusing heater lamps /1 (L1), /2 (L2) and /3 (L3) turn ON while in the warm-up, and they turn OFF at a prescribed temperature.

(2) While in the print

- For the fusing roller /Up, the fusing heater lamp /1 (L1) and /2 (L2) are turned ON/OFF so that the temperature comes to a prescribed temperature.
- For the fusing heating roller, the fusing heater lamp /3 (L3) is turned ON/OFF so that the temperature comes to a prescribed temperature.

(3) Non paper-through section temperature control

- To prevent the fusing roller /Up temperature from increasing, decreases the target temperature by the prescribed value when the fusing roller /Up edge temperature exceeds the prescribed value while in the print.
- After the target temperature is decreased, the fusing roller /Up temperature is monitored at every the fusing heater lamp /1 (L1) turns OFF/ON. Thus, the temperature during printing operation is increased or decreased by the prescribed value according to the detected temperature.

(4) Alarm control

- To prevent the fusing under, the printing operation is stopped and warm-up is performed when the detected temperature of the fusing roller /Up becomes the prescribed temperature.
- Restarts printing automatically when the warm-up is completed.

(5) While in standby

- For the fusing roller /Up, the fusing heater lamp /1 (L1) turns ON when the temperature is 3°C lower than a prescribed temperature and turns OFF when the temperature is 2°C higher than a prescribed temperature.
- For the fusing heating roller, the fusing heater lamp /3 (L3) turns ON when the temperature is 1°C lower than a prescribed temperature and turns OFF when the temperature is 1°C higher than a prescribed temperature.
- The heater lamp /2 (L2) does not turn ON to prevent flicker.

(6) Control for improvement of the fusibility at the starting of printing.

- The printing starts after the specified period of time after the start button is pressed on the condition that the temperature of the fusing roller /Up is higher than the prescribed temperature.
- When the detected temperature is lower than the prescribed value, it conducts warming-up until the temperature reaches the prescribed value.
- The software DIPSW36-2 can change the condition for conducting this control.

(7) Preparatory rotation after printing

- It conducts the preparatory rotation for 10 seconds when the temperature of the fusing roller /Up reaches the prescribed value while in idling.
- The fusing heater lamp /1 (L1) and /2 (L2) is forcibly turned OFF when printing is completed.
- When there is a print reservation, this control does not function but the printing operation takes priority.
- Also when the next print job is inputted while conducting this control, the printing operation takes priority.

(8) Power save

- The timer starts to count when the last printing completes. When the operation button is not pressed within a specified period of time, the mode switches to the low-power mode or the shut-off mode.
- The length of time which elapses before switching to the low-power mode or the shut-off mode can be specified arbitrarily.
- When the setting time of the low-power mode and shut-off mode coincide, the shut-off mode is selected.

(a) Low-power mode

- For the fusing roller /Up, the fusing heater lamp /1 (L1) is turned ON/OFF so that the temperature comes to a prescribed temperature.

- For the fusing heating roller, the fusing heater lamp /3 (L3) is turned ON/OFF so that the temperature comes to a prescribed temperature.
- The heater lamp /2 (L2) does not turn ON to prevent flicker.

(b) Shut-OFF mode

- When switching to the shut-off mode, the energization to the fusing heater lamp /1 (L1), /2 (L2) and /3 (L3) turns OFF.

2.3.5 Protection against temperature abnormality

For details, refer to [O.14.3.6 Protection against temperature abnormality](#).

3. PAPER FEED ASSIST SECTION

3.1 Configuration

- Reinstall the paper feed assist parts to the tray4 of PF-703.
- The used paper feed assist parts differ according to the envelope size.

(1) When using large size envelope

- When the envelope is 141 to 245mm in the main scan direction.

[1] Regulation guide /Fr	[2] Regulation guide /Rr
--------------------------	--------------------------

(2) When using small size envelope

- When the envelope is 100 to 140mm in the main scan direction. However this function does not work when the envelope is between 120mm and 135mm.

[1] Positioning screw	[2] Assist guide /Fr
[3] Duct cover	[4] Stopper
[5] Assist guide /Rr	-

- Use the duct lock [1] and small size guide [2] of PF-703.

2.2.2 Humidification section gate drive

[1] Humidification section gate solenoid (SD1)	[2] Humidification section gate
--	---------------------------------

2.3 Operation

2.3.1 Conveyance control

(1) Mechanism

- The entrance conveyance motor (M1) and the intermediate conveyance motor (M2) conduct the conveyance.
- M1 drives the entrance conveyance rollers /1, /2 and /3 via the gear and the belt.
- The entrance conveyance roller /3 has the one-way clutch and it makes up the conveyance speed gap between the humidification section entrance conveyance motor (M7) and M1.
- M2 drives the intermediate conveyance rollers /1 and /2 via the gear and the belt.
- The intermediate conveyance roller /2 receives the paper conveyed from the humidification section and conveys it to the de-curler section.

(2) Entrance conveyance control of humidifier ON Mode

1. When the start button turns ON, the entrance conveyance motor (M1) turns ON at the same line speed as the paper exit from the main body, and the intermediate conveyance motor (M2) turns ON at 570 mm/s. Controls the speed of M1 only in following cases. In other cases, it drives at the constant speed during printing.
 - When the exit line speed of the main body is 1250mm/s, 1000mm/s or 750mm/s and the paper is conveyed whose length in the direction of the sub-scan is 301mm to 488mm.
 - When the exit line speed of the main body is 490mm/s, or 330mm/s and the paper is conveyed whose length in the direction of the sub-scan is 431mm to 488mm.
2. After a specified period of time since the humidification section entrance sensor (PS7) detects the leading edge of paper and turns ON, M1 switches to 570mm/s [1].
3. After a specified period of time since PS1 turns OFF, M1 returns to the exit line speed of the main body [2].
4. When the paper exit sensor (PS12) detects the trailing edge of the last paper and turns OFF, M1 and M2 turn OFF.

[1] M1 switches to 570mm/s	[2] M1 switches to the same line speed as the main body for the next paper
----------------------------	--

*The picture shows the case of paper 301mm to 488mm in sub scan direction conveyed at 1000mm/s.

(3) Entrance conveyance control of humidifier OFF Mode

- When the start button turns ON, the entrance conveyance motor (M1) and the intermediate conveyance motor (M2) turn ON at the same line speed as the main body.
- Controls the speed of M1 and M2 only when the paper is conveyed from the main body at the line speed of 750mm/s, 1000mm/s, 1250 mm/s. In other cases, it drives at the constant speed during printing.

- When the 139mm to 260mm length of paper in the sub scan direction is conveyed at 750 mm/s, 1000 mm/s, and 1250 mm/s only M2 reduces its speed to 570 mm/s after a specified period of time when the de-curler entrance solenoid (PS2) detects the leading edge of paper, and M2 returns to the speed of the main body after a specified period of time when PS2 detects the trailing edge of the paper.
- When the paper whose length in the sub scan direction is 261mm to 488mm is conveyed at the line speed of 750 mm/s, 1000 mm/s, and 1250 mm/s, M1 and M2 reduce its speed to 570 mm/s after a specified period of time since PS2 detects the leading edge of paper. M1 returns to the speed of the main body after a specified period of time since the entrance sensor (PS1) detects the trailing edge of paper, and M2 returns to the speed of the main body after a specified period of time since PS2 detects the trailing edge of paper.

2.3.2 Humidification section gate control

(1) Mechanism

- The humidification section gate solenoid (SD1) drives the humidification section gate. The gate is set to the bypass route when it is turned OFF and is set to the conveyance route to the humidification section when it is turned ON.
- The conveyance route to the humidification section is selected for humidifying paper.

(2) Humidification section gate control

(a) Humidifier mode

1. A specified period of time after the entrance sensor (PS1) detects the leading edge of the paper and turns ON, the humidification gate solenoid (SD1) turns ON and switches the path to the humidification section.
2. When the paper exit sensor (PS12) detects the trailing edge of the last paper and turns OFF, SD1 turns OFF.

(b) Humidifier OFF mode

- In the Humidifier OFF mode, SD1 does not turn ON.

[9]	De-curler pressure roller /Up	[10]	De-curler pressure cam /Up

[11] De-curler roller /4	-
--------------------------	---

3.3 Operation

3.3.1 Outline of de-curler

(1) Outline of de-curler

- The de-curler section consists of the de-curlers /1 [13], /2 [5], /3 [15] and /4 [17]. The de-curlers /3 and /4 correct the paper curl through the zigzag path [2] that can change the flexion strength.
- The de-curler /1 corrects the large convex curled paper with the de-curler roller /1 [10] of curvature R5 and the de-curler belt /1 [12].
- The de-curler /2 corrects the large concave curled paper with the de-curler roller /2 [7] of curvature R5 and the de-curler belt /2 [6].
- When the de-curler/1, /2 is not used, the de-curler gate solenoid/1 (SD2), /2 (SD3) drives the de-curler gate/1 [11], /2 [8] and switches to the bypass path [9], [14].
- The de-curler/3, /4 corrects the convex-concave curled paper by changing the shapes of 2 de-curler belts /Rt [3] and /Lt [16] pressing with the de-curler roller/3 [4], /4 [1].

[1] De-curler roller /4	[2] Zigzag path
[3] De-curler belt /Rt	[4] De-curler roller /3
[5] De-curler /2	[6] De-curler belt /2
[7] De-curler roller /2	[8] De-curler gate /2
[9] Bypass path	[10] De-curler roller /1
[11] De-curler gate /1	[12] De-curler belt /1
[13] De-curler /1	[14] Bypass path
[15] De-curler /3	[16] De-curler belt /Lt
[17] De-curler /4	-

(2) De-curler /3 mechanism

- The de-curler pressure motor /Lw (M5) drives the pressure of the de-curler roller /3 [9] via the de-curler pressure cam /Lw [7].
- The de-curler pressure home sensor /Lw (PS5) [3] detects the home position.
- When the de-curler pressure cam /Lw is at the home position, the de-curler roller pressure roller is pressed at the position [2]. At this time, the belt is at the push out position [5], and the wrap angle of the belt of the de-curler roller /3 is 22.5° [1].
- When the de-curler pressure cam /Lw presses the de-curler roller pressure roller at the position [6], the de-curler roller /3 is at the position [8] and the belt is parallel [4].

[1] Wrap angle	[2] Home position
[3] De-curler pressure home sensor /Lw (PS6) [3]	[4] De-curler belt /Rt, /Lt parallel
[5] De-curler belt /Rt, /Lt pressed	[6] De-curler belt /Rt, /Lt pressing position in parallel
[7] De-curler pressure cam /Lw	[8] De-curler roller /3 in parallel
[9] De-curler roller /3	-

(3) De-curler /4 mechanism

1. The de-curler pressure motor /Up (M6) drives the pressure [5] of the de-curler roller /4 [2] via the de-curler pressure cam /Up [9].
2. The de-curler pressure home sensor /Up (PS6) [3] detects the home position.
3. The belt exit wrap angle [13] of the belt roller /Up [1] changes depending on the pressing position of the de-curler roller /4. It has 6 patterns of angle; 0°, 15°, 22.5°, 30°, 37.5°, 45°.
4. The de-curler pressure roller is pressed when the belt exit wrap angle 30° is the home position and the position of the de-curler pressure cam /Up [8]. 30° is the angle that paper exits from the de-curl section keeping the correction effect of the de-curler /1, /2.
5. The belt is parallel [4] when the belt exit wrap angle is 0° and the pressing position of the de-curler pressure cam /Up is [12].
6. The following list shows the positional relation between the belt exit wrap angle and the de-curler cam/Up.

Belt wrap angle	De-curler pressure cam rotation angle (from home position)
0° (parallel)	- 202.5° [12]
15°	- 100° [11]
22.5°	- 50° [10]
30° (home position)	0° [8]
37.5°	50° [7]
45°	100° [6]

7. When the de-curler roller /4 is other than parallel by being pushed out, the de-curler roller /3 is also at the push out position increasing the flexing number.

[1]	Belt roller /Up	[2]	De-curler roller /4
[3]	De-curler pressure home sensor /Up (PS6)	[4]	Parallel
[5]	Pressed status	[6]	De-curler pressure cam angle 100°

[9]	De-curler pressure cam	[10]	De-curler pressure cam angle -50°
[11]	De-curler pressure cam angle -100°	[12]	De-curler pressure cam angle -202.5°
[13]	Belt exit wrap angle	-	

(4) De-curler paper feed pattern

- The method to adjust the curl depends on the paper type and weight.
- The paper feed pattern has 2 types; the default mode and the individual setting mode.
- The de-curlers /1 and /2 which adjust strongly with small curvature are effective for thin paper.
- The de-curlers /3 and /4 which adjust to the exit wrap angle after flexing concavity and convexity some times are effective for thick paper.

(a) Default mode

It is the default when "0" is selected on the "Curl Adjustment screen" of the operation panel.

HM Provided or not provided	Paper Size	Paper weight (g/m ²)	Humidification	De-curler			
				/1	/2	/3	/4
Not provided	All Size	40 to 162	×	○	○	Pressure	30°

○: Use the function

x: Not use the function

*1 Humidifier Setting is not available when the paper weight is 135 g/m² or less for Coated, PrePrinted, Blank Insert Sheet, Embossed, and Embossed2.

3.3.2 De-curler section conveyance control

(1) Mechanism

The de-curler conveyance motor (M3) drives the de-curler conveyance rollers /1 and /2, and the de-curler belts /Rt and /Lt.

(2) Conveyance control

- In the humidification ON mode, or when the paper is conveyed from the main body at the speed of 1000mm/s, the de-curler conveyance motor (M3) turns ON at the line speed of 570mm/s after a print job is received.
In other than the case above, M3 turns ON at the paper exit line speed of the main body when receiving a print job.
- After a specified period of time since the paper exit sensor (PS12) detects the trailing edge of the last paper and turns OFF, M3 turns OFF.

3.3.3 De-curlers /1 and /2 control

(1) When the de-curler control is not switched during printing

- When the de-curlers /1 and /2 are the bypass route, the de-curler solenoids /1 (SD2) and /2 (SD3) turn ON with receiving a print job.
- When the paper exit sensor (PS12) detects the trailing edge of the last paper and turns OFF, SD2 turns OFF, then SD3 turns OFF after a specified period of time.

(2) When the de-curler control is switched during printing

1. After a specified period of time since the humidification section entrance sensor(PS7)(in humidifier ON mode) or the entrance sensor (PS1) (in humidifier OFF mode) detects the leading edge of the paper and turns ON, the de-curler gate solenoid /1 (SD2) switches ON and OFF.
2. After a specified period of time since the de-curler entrance sensor (PS2) detects the leading edge of the paper and turns ON, the de-curler gate solenoid /2 (SD3) switches ON and OFF.
3. When the paper exit sensor (PS12) detects the trailing edge of the last paper and turns OFF, SD2 turns OFF, then SD3 turns OFF after a specified period of time.

3.3.4 De-curlers /3 and /4 control

1. When receiving a print job, the de-curler pressure motors /Lw (M5) and /Up (M6) turn ON, move the de-curler pressure cams /Up and /Lw to the prescribed position, and turn OFF.
2. If the de-curl condition changes during printing, M5 and M6 turn ON and move the de-curler pressure cam to the pressing position after a specified period of time since the color density detection timing sensor (PS3) detects the trailing edge of paper, and turn OFF.
3. After a specified period of time since the paper exit sensor (PS12) detects the trailing edge of the last paper and turns OFF, M5 and M6 turn ON and start the returning operation to the home position.
4. When the de-curler pressure home sensor /Lw (PS5) and /Up (PS6) turn ON, M5 and M6 turn OFF.

4. PAPER EXIT SECTION

[3]	Paper exit motor (M4)	[4]	Paper exit roller /2
[5]	Paper exit roller /1	-	

4.3 Operation

4.3.1 Paper exit conveyance control

(1) Mechanism

- The paper exit motor (M4) drives the paper exit rollers /1 [6], /2 [5], /3 [3], and /4 [1].
- The paper exit rollers /3 and /4 have the one-way clutch to narrow the conveyance line speed gap.
- The color density detection timing sensor (PS3) [7], the paper exit conveyance sensor (PS4) [4], and the paper exit sensor (PS12) [2] detect the paper.

[1] Paper exit roller /4	[2] Paper exit sensor (PS12)
[3] Paper exit roller /3	[4] Paper exit conveyance sensor (PS4)
[5] Paper exit roller /2	[6] Paper exit roller /1
[7] Color density detection timing sensor (PS3)	-

(2) Straight conveyance

- The control differs according to the paper size.

(a) Paper length:133mm to 220 mm (when the de-curler conveyance motor (M3) is 570mm/s and the paper weight is 244g/m² or less)

1. In the humidification ON mode, or when the paper is conveyed from the main body at the speed of 1250mm/s, 1000mm/s, 750mm/s, 570mm/s, the paper exit motor (M4) turns ON at the line speed of 570mm/s after a print job is received.
2. After a specified period of time since the color density detection timing sensor (PS3) detects the leading edge of paper and turns ON [2], M4 switches to 1250mm/s [3].
3. After a specified period of time since the paper exit conveyance sensor (PS4) detects the leading edge of paper and turns ON [4], M4 switches to 1000mm/s [5].

4. After a specified period of time since the paper exit sensor (PS12) detects the paper leading edge and turns ON [6], M4 switches to the same line speed as the paper exit from the main body or 570mm/s for the succeeding paper [7].

[1]	Print start ON	[2]	Detection of the leading edge by PS3
[3]	M4 switches to 1250mm/s	[4]	Detection of the leading edge by PS4
[5]	M4 switches to 1000mm/s	[6]	M4 switches to 570mm/s

(b) Paper length: 133mm to 220mm (except the case (a))

- When the start button turns ON, the paper exit motor (M4) turns ON at 570mm/s [1].
- After a specified period of time since the color density detection timing sensor (PS3) detects the leading edge of paper and turns ON [2], M4 switches the line speed to 1000mm/s [3].
- After a specified period of time since the paper exit sensor (PS12) detects the paper leading edge and turns ON [4], M4 switches to the same line speed as the paper exit from the main body or 570 mm/s for the succeeding paper [5].

[1]	Print start ON	[2]	Detection of the leading edge by PS3
[3]	M4 switches to 1000mm/s	[4]	Detection of the leading edge by PS12
[5]	M4 switches for the succeeding paper	-	

(c) Paper length: 221mm to 488mm

- In the humidification ON mode, in the output paper density detection mode or when the paper is conveyed from the main body at the speed of 1000mm/s, the paper exit motor (M4) turns ON at the line speed of 570mm/s after a print job is received [1]. During other modes, M4 turns ON at the line speed. (The figure shows the case when M4 turns ON at 570mm/s.)
- After a specified period of time since the color density detection timing sensor (PS3) detects the leading edge of paper and turns ON [2], M4 switches the line speed to 1000mm/s [3].
- When the paper exit sensor (PS4) detects the paper trailing edge and turns OFF, M4 switches to the same line speed as the paper exit from the main body or 570mm/s for the succeeding paper [4].

5.2.4 Water feed pump drive

[1]	Pump motor (P1)	[2]	Water feed tank
[3]	Water tank assy	-	

5.3 Operation

5.3.1 Outline of humidification section

1. In the humidification mode, the pump motor (P1) always feeds water [8] into the water tank [7] for the amount 450cc/min (5 times or more than the water tank capacity + humidification). Flooded water is flowed back to the water feed tank [9] through the collection groove [6], and water is kept at the constant depth in the water tank.
2. The water feed roller [4] sunk in the water tank is coated by water. The thickness of coated water is uniformed by the pressed control roller [5] then transferred to the humidification rollers /Rt and /Lt [3].
3. Uniformed water is fed to paper passed through between the humidification rollers /Rt and /Lt and the water content of paper is increased about 2%.
4. After water that is not sank into paper but remains on the surface is removed by the humidification section paper fans /1 to /6 (FM6 to FM11) [2], paper is conveyed by the humidification section conveyance roller /2 [1].

[1]	Humidification section conveyance roller /2	[2]	Humidification section paper fan /1 to /6 (FM6 to FM11)
[3]	Humidification roller /Rt and /Lt	[4]	Water feed roller
[5]	Control roller	[6]	Collection groove
[7]	Water tank	[8]	Water feed
[9]	Reflux		

5.3.2 Humidification section conveyance control

(1) Mechanism

- The humidification section entrance conveyance motor (M7) and the humidification section conveyance motor (M8) drive the conveyance in the humidifier section.
- M7 drives the humidification section entrance conveyance rollers /1 and /2.
- M8 drives the humidification section conveyance rollers /1 and /2 and the humidification roller /Rt.
- M8 drives at the constant speed of 570mm/s to stabilize the water feed amount to paper.

(2) Humidifier ON mode(270mm or less length of paper)

- When the start button turns ON, the humidification section entrance conveyance motor (M7) turns ON at the same line speed as the paper exit of the main body, and the humidification section conveyance motor (M8) turns ON at 570 mm/s [1].
- After a specified period of time since the humidification section entrance sensor (PS7) detects the leading edge of paper and turns ON [2], M7 switches the line speed to 570mm/s [3] to align to the conveyance line speed of M8.
- After a specified period of time, M7 returns to the exit line speed of the main body [4].

[1]	Print start ON	[2]	Detection of the leading edge by PS7
[3]	M7 switches the humidifier speed to 570 mm/s	[4]	M7 switches to the paper exit speed of the main body

(3) Humidifier ON mode(271mm or more length of paper)

- When the start button turns ON, the humidification section entrance conveyance motor (M7) turns ON at the same line speed as the paper exit of the main body, and the humidification section conveyance motor (M8) turns ON at 570 mm/s [1].
- After a specified period of time since the humidification section entrance sensor (PS7) detects the leading edge of paper and turns ON [2], M7 switches the line speed to 570mm/s [3] to align to the conveyance line speed of M8.
- After a specified period of time since the entrance sensor (PS1) turns OFF by detecting the paper trailing edge [4], M7 returns to the exit line speed of the main body[5].

[1]	Print start ON	[2]	Detection of the leading edge by PS7
[3]	M7 switches the humidifier speed to 570mm/s	[4]	Paper trailing edge detection by PS1
[5]	M7 switches to the paper exit speed of the main body	-	

(4) Humidifier ON mode (paper exit line speed of the main body is 1250mm/s, 1000mm/s, 750mm/s)

- When the start button turns ON, the humidification section entrance conveyance motor (M7) turns ON at the same line speed as the paper exit of the main body, and the humidification section conveyance motor (M8) turns ON at 570 mm/s [1].
- After a specified period of time since the humidification section entrance sensor (PS7) detects the leading edge of paper and turns ON [2], M7 switches the line speed to 570 mm/s [3] to align to the conveyance line speed of M8.
- After a specified period of time since PS7 turns OFF [4] by detecting the paper trailing edge, M7 returns to the exit line speed of the main body [5].

[1]	Print start ON	[2]	Detection of the leading edge by PS7
[3]	M7 switches the humidifier speed to 570mm/s	[4]	Paper trailing edge detection by PS7
[5]	M7 switches to the paper exit speed of the main body	-	

5.3.3 Humidification roller / water feed roller pressure control

(1) Mechanism

(a) OUTLINE

- The springs [1] and [8] on the shafts of the control rollers /Rt [20] and /Lt [15] press the humidification rollers /Rt [18], /Lt [17] and the water feed rollers /Rt [19], /Lt [16] to the paper path side.
- Press the humidification pressure cams /FrRt [4] and /RrRt [13], /FrLt [6] and /RrLt [12] driven by the humidification section roller pressure motors /Rt (M9) [3] and /Lt (M10) [5] to the pressure rollers /FrRt [2] and /RrRt [14], /FrLt [7] and /RrLt [11] to execute the press/release.
- The humidification section roller pressure home sensors /Rt (PS9) [9] and /Lt (PS10) [10] detect the pressed position.

[1] Spring	[2] Pressure roller /FrRt
[3] Drive gear of the humidification roller pressure motor /Rt (M9) shaft	[4] Humidification pressure cam /FrRt
[5] Drive gear of the humidification roller pressure motor /Lt (M10) shaft	[6] Humidification pressure cam /FrLt
[7] Pressure roller /FrLt	[8] Spring
[9] Humidification roller pressure home sensor /Rt (PS9)	[10] Humidification roller pressure home sensor /Lt (PS10)
[11] Pressure roller /RrLt	[12] Humidification pressure cam /RrLt
[13] Humidification pressure cam /RrRt	[14] Pressure roller /RrRt
[15] Control roller /Lt	[16] Water feed roller /Lt
[17] Humidification roller /Lt	[18] Humidification roller /Rt
[19] Water feed roller /Rt	[20] Control roller /Rt

(b) Patterns of pressure/release of humidification roller and water feed roller

- Depending on the angle of the claws [8] on the humidification pressure cams /Rt [10] and /Lt [9], the status differs between the home position and humidification ON.

Status	Angle of the humidification pressure cam	Gap between the humidification rollers /Rt and /Lt	Gap between the humidification roller /Rt and the water feed roller /Rt Gap between the humidification roller /Lt and the water feed roller /Lt
Home position	23°	Release	Release
Humidification ON	100°	Pressure	Pressure (Feed water to the humidification roller)

<Home position>

- The angle of the humidification pressure cam is 23° [7].
- The humidification pressure cams /Rt [10] and /Lt [9] push each other to release the humidification rollers /Rt and /Lt.
- The humidification pressure cam /Rt and the pressure roller /Rt [11], the humidification pressure cam /Lt and the pressure roller /Lt [6] push each other to release the humidification roller /Rt and the water feed roller /Rt, the humidification roller /Lt and the water feed roller /Lt.

<Humidification ON position>

- The angle of the humidification pressure cam is 100° [5].
- Since not all humidification pressure cams and the pressure rollers press each other, the humidification rollers /Rt and /Lt, the humidification rollers and the water feed rollers are pressed.

[1]	Home position	[2]	Humidification ON position
[3]	100°	[4]	Pressure roller /Lt
[5]	23°	[6]	Claw
[7]	Humidification pressure cam /Lt	[8]	Humidification pressure cam /Rt
[9]	Pressure roller /Rt	-	

(2) Control

(a) With humidification

- After a specified period of time since the humidification section entrance sensor (PS7) detects the leading edge of the 1st sheet and turns ON [1], the humidification section roller pressure motors /Rt (M9) and /Lt (M10) turn ON and move from the home position to the humidification ON position [2]. (The picture is for the case when the main body process speed is not 1000mm/s)
- When the interval between the paper exit of the main body is long (such as large size) and the specified time passes since PS10 detects the trailing edge and turns OFF [3], M9 and M10 turn ON and start returning to the home position to release the humidification rollers [4].
- When the humidification section roller pressure home sensors /Rt (PS9) and /Lt (PS10) turn ON, M9 and M10 turn OFF [5].
- After a specified period of time since the humidification section entrance sensor (PS7) detects the leading edge of the succeeding paper and turns ON [6], M9 and M10 turn ON again and move to the humidification ON position.
- A specified period of time after PS7 turns OFF, M9 and M10 turn ON to return to the home position [8].
- When the paper exit sensor (PS12) detects the trailing edge of the last paper and turns OFF [9], M8 turns OFF.

[1]	Detection of the leading edge of the 1st sheet	[2]	Move to the humidification ON position
[3]	Detection of the trailing edge in the exit interval	[4]	Releasing the humidification roller started (The exit interval is long.)
[5]	Returning to the home position	[6]	Detection of the leading edge of the succeeding paper
[7]	Move to the humidification ON position	[8]	Returning to the home position
[9]	Detecting the trailing edge of the last paper	-	

(b) Switch control from humidification ON to humidification OFF

- After a specified period of time since the de-curler entrance sensor (PS7) detects the trailing edge of the last humidified paper and turns OFF, the humidification section roller pressure motors /Rt (M9) and /Lt (M10) turn ON to move from the humidification ON position to the home position.

2. After a specified period of time since PS1 turns ON, the humidification gate solenoid (SD1) turns OFF and switches to the bypass route.

(c) Switch control from humidification OFF to humidification ON

1. After a specified period of time since the entrance sensor (PS1) detects the leading edge of the first humidification paper and turns ON, humidification section gate solenoid (SD1) turns ON and switches the paper path to the humidification section.
2. After a specified period of time since the humidification section entrance sensor (PS7) detects the leading edge of the paper and turns ON, the humidification section roller pressure motors /Rt (M9) and /Lt (M10) turn ON and move from the home position to the humidification ON position.

5.3.4 Water feed control

(1) Pump motor control

- As the initial operation, the pump motor (P1) turns ON for the specified time and supplies water for the amount lost due to evaporation to fill the water tank.
- When with the humidifier, P1 turns ON a specified period of time after the entrance sensor (PS1) detects the leading edge of the paper and turns ON. P1 turns OFF when the paper exit sensor (PS12) detects the trailing edge of paper and turns OFF.
- When without the humidifier, P1 does not turn ON.

(2) Water feed tank empty detection control

- When the water level in the water feed tank goes down, the coupling bar [2] of the float [3] goes down. Then the actuator [1] turns ON the water tank empty sensor (PS8) [4] to disable the humidifier function.
- When PS8 turns ON in the humidifier ON mode, a message appears on the operation panel of the main body.
- When any print is in progress with PS8 turned ON, the main body stops after completion of the exit of up to 10 sheets.

[1]	Actuator	[2]	Coupling bar
[3]	Float	[4]	Water tank empty sensor (PS8)

(3) Water tank full detection control

- When the reflux route from the water tank closes and the collection groove [3] exceeds the specified water level, the float [4] comes up. Then, the actuator [2] turns OFF the water tank full sensor (PS13) [1] and the pump motor (P1) turns OFF.
- When detecting the water tank full, an error code appears on the operation panel of the main body to disable the humidifier function.

[1]	Water tank full sensor (PS13)	[2]	Actuator
[3]	Collection groove	[4]	Float

6. OTHER CONTROLS

6.1 Fan control

6.1.1 Configuration

[1]	Entrance paper fan /3 (FM3)	[2]	Entrance paper fan /6 (FM17)
[3]	Entrance paper fan /9 (FM20)	[4]	Entrance paper fan /8 (FM19)
[5]	Humidification section paper fan /4 (FM9)	[6]	Humidification section paper fan /5 (FM10)
[7]	Humidification section paper fan /6 (FM11)	[8]	Power supply fan (FM14)
[9]	Ventilation assist fan /3 (FM21)	[10]	Ventilation assist fan /2 (FM5)
[11]	Ventilation assist fan /1 (FM4)	[12]	Humidification section paper fan /3 (FM8)
[13]	Humidification section paper fan /2 (FM7)	[14]	Humidification section paper fan /1 (FM6)
[15]	Entrance paper fan /7 (FM18)	[16]	Entrance paper fan /4 (FM15)
[17]	Entrance paper fan /1 (FM1)	[18]	Entrance paper fan /2 (FM2)
[19]	Entrance paper fan /5 (FM16)	-	

6.1.2 Control

(1) Entrance paper fan

(a) Purpose

- The entrance paper fans /1 (FM1), /2 (FM2), and /3 (FM3) blow air to the entrance conveyance rollers /1 and /2 and the conveyance guide plate to cool down.
- The entrance paper fans /4 (FM15), /5 (FM16), and /6 (FM17) blow air to the driven roller of the entrance conveyance rollers /1 and /2, and the conveyance guide plate to cool down.
- The entrance paper fans /7 (FM18), /8 (FM19), and /9 (FM20) blow air to the driven roller of the entrance conveyance roller /3, and the guide plate to cool down.
- The equally-spaced rollers which are mounted in the main scan direction area cool paper uniformly to prevent the wax unevenness.

(b) Operation timing

- Each fan turns ON when receiving a print job and turns OFF at printing end.

(2) Humidification section paper fan**(a) Purpose**

- In humidifier ON mode, the humidification section paper fans /1 (FM6), /2 (FM7), /3 (FM8), /4 (FM9), /5 (FM10), and /6 (FM11) blow air to paper to remove water which remains on paper.
- In humidifier OFF mode, it cools paper.

(b) Operation timing

- Each fan turns ON when receiving a print job and turns OFF at printing end.

(3) Ventilation assist fan**(a) Purpose**

- The ventilation assist fans /1 (FM4), /2 (FM5), and /3 (FM21) exhaust heat remains in the RU.

(b) Operation timing

- Each fan turns ON when receiving a print job and turns OFF at printing end.

(4) Power supply fan**(a) Purpose**

- The power supply fan (FM14) exhausts heat in the DC power supply (DCPS).

(b) Operation timing

- FM14 turns ON when the sub power switch turns ON. It decelerates to 50% during standby and switches to 100% when receiving a print job.

6.2 Door detection control

- When the front door opens and the door switch (SW1) turns OFF, the 24V power source of the RU control board (RUCB) is shut down and the operation stops.

2.2.2 Straight gate drive

[1]	Lever	[2]	Spring
[3]	Straight gate	[4]	Gate home sensor (PS7)
[5]	Cam	[6]	Actuator
[7]	Gate motor (M5)	-	

2.3 Operation

2.3.1 Conveyance path switching control

- Straight gate [2] switches the straight conveyance path [8] and reverse/exit path [4].
- The straight gate is equipped with the lever [1] and the lever contacts with the cam [7] all the time by the spring [3].
- When the cam rotates, the distance between the shaft of the cam and the lever changes. Thus, the position of the straight gate changes to 2 steps.
- Cam is driven by the rotation of the gate motor [12].
- The cam is equipped with the actuator [10] and the gate home sensor (PS7) [6] controls the rotation position.
- During the straight conveyance, the cam stops at the home position. At this time, the lever contacts with the periphery of the cam which has long distance from the shaft, so the straight gate is closed.
- When the straight gate is closed, the paper [9] exited over the upper side of the straight gate.
- During the reverse/exit conveyance, the lever contacts with the periphery which is close to the shaft, so the straight gate is opened.
- When the straight gate is opened, the paper [5] contacts with the bottom side of the straight gate and conveyed to the stacker section.
- During the straight conveyance, M5 does not operate and the straight gate keeps being closed.
- During the reverse/exit conveyance, M5 rotates in the forward direction when the start button turns ON and then M5 turns OFF after a specified period of time since PS7 turns OFF. Thus, the straight gate keeps being opened until the job is completed.
- When the paper exit sensor (PS2) detects the trailing edge of the last sheet of paper and turns OFF, M5 rotates in reverse direction and turns OFF after a specified period of time since PS7 turns ON. Thus, the straight gate is closed and enters the stand-by.

[1]	Lever	[2]	Straight gate
[3]	Spring	[4]	Reverse/exit conveyance

[7]	Cam	[8]	Straight conveyance
[9]	Paper (Straight conveyance)	[10]	Actuator
[11]	Timing belt	[12]	Gate motor (M5)

2.3.2 Paper feed mechanism

- The entrance motor (M1) and the paper exit motor (M2) conduct the conveyance.
- M1 drives the entrance roller /1, /2 and stacker entrance roller through the timing belt.
- The M2 drives the re-feed roller, merging section roller and paper exit roller via the timing belt.
- M1, M2 are equipped with the damper to make the machine calm.

2.3.3 Line speed switch control

- The paper which is conveyed to RU at the line speed 1250mm/s, 570mm/s, 490mm/s or 330mm/s is exited at the line speed 1250mm/s and 1000mm/s.
- In the simplex mode, the double sheets reverse/exit conveyance is performed to the paper which is conveyed at the speed of 1250mm/s or 570mm/s.
- In the simplex mode, either of the straight conveyance or the single sheet reverse/exit conveyance is performed (depending on the configuration and the mode of the finisher) to the paper which is conveyed at the speed of 490mm/s or 330mm/s.
- In the duplex mode, straight conveyance is performed regardless of the paper size which is conveyed.

2.3.4 Conveyance control

(1) Straight conveyance

- The operation of the straight conveyance differs according to the paper length in the feed direction whether it is less than 210mm or 210mm or longer.
- When the paper length in the feed direction is 210mm or longer, trigger of the operation for the entrance motor (M1) and output motor (M2) differs according to the relationship between the line speed of the machine and the length in the feed direction.
- For tab paper, the operation is the same as when the paper length in the feed direction is 210mm or longer.

(a) When the paper length in the feed direction is less than 210mm

- When the start button turns ON [1], the entrance motor (M1) turns ON at the same low line speed as the machine, and the paper exit motor (M2) turns ON at high line speed 1000mm/s which is the same speed as the RU.
- M1 turns ON at low speed and the entrance roller/1 and /2 rotate at the same speed as the main body so that paper ejected from the main body is conveyed to the RU smoothly.
- When the paper exit sensor (PS3) detects the leading edge of the 1st sheet of paper, M1 switches from low speed to high speed [2] after a specified period of time and the line speed inside of the RU is accelerated.
- When M1 switches from low speed to high speed, the trailing edge of the 1st sheet of paper already passes the output roller. Therefore, M1 is not effected when the line speed of the RU is accelerated.
- When the entrance sensor (PS1) detects the trailing edge of the 1st sheet of paper, M1 switches to low speed again [3] after a specified period of time and is ready to accept the next sheet.
- When M1 switches to low speed again to accept the 2nd sheet of paper, the trailing edge of the 1st sheet of paper already passes the entrance roller 2/. Therefore, M1 is not effected when M1 slows the line speed.
- M2 is ON at high speed so the paper arrives at the junction roller which M2 drives is exited through the output roller, maintaining the line speed 1000mm/2.
- For paper after the 2nd sheet, the same operation as the 1st sheet of paper is performed.

- When the paper exit sensor (PS2) detects the trailing edge of the last sheet of paper, M1 and M2 turn OFF after a specified period of time.

[1]	Print start	[2]	Speed up the line speed for the 1st sheet of paper
[3]	Switching to the line speed for acceptance the 2nd sheet	-	

(b) When the paper length in the feed direction is 210mm or longer

- When the start button turns ON [1], the entrance motor (M1) and the output motor (M2) turn ON at the same low line speed as the machine.
- M1 turns ON at low speed and the entrance roller/1 and /2 rotate at the same speed as the main body so that paper ejected from the main body is conveyed to the RU smoothly.
- When the paper exit sensor (PS3) detects the leading edge of the 1st sheet of paper, M1 and M2 switch from low speed to high speed after a specified period of time [2] and the line speed of the RU is accelerated to 1000mm/s.
- When M1 switches from low speed to high speed, the trailing edge of the 1st sheet of paper already passes the output roller. Therefore, M1 is not effected when the line speed of the RU is accelerated.
- When the trailing edge of the 1st sheet of paper passes the output roller, the leading edge of the paper arrives at the junction roller which M2 drives, so M2 turns ON at low speed the same as M1 in advance. Then M2 accelerates at the same time as M1.
- Depending on the line speed of the machine and the paper length in the feed direction, it sometimes occur that the speed of M1 or M2 is changed before PS3 turns ON.
- When the entrance sensor (PS1) detects the trailing edge of the 1st sheet of paper, M1 switches to low speed again after a specified period of time [4] and is ready to accept the next sheet.
- For tab paper, the time, which is added for a specified period of time to ON time of PS1 [3], is a starting point for the above operation.
- When M1 switches to low speed again to accept the 2nd sheet of paper, the trailing edge of the 1st sheet of paper already passes the entrance roller 2/. Therefore, M1 is not effected when M1 slows the line speed.
- M2 remains at high speed so the paper arrives at the junction roller which M2 drives is exited through the output roller, maintaining the line speed 1000mm/s.
- The 2nd sheet of paper is conveyed to RU at low speed during the exiting the 1st sheet of paper. However, it does not reach the junction roller which M2 drives so the paper exit operation at high speed is not effected.
- When the paper exit sensor (PS2) detects the trailing edge of the 1st sheet of paper, M2 switches to low speed again after a specified period of time[5] and is ready to accept the next sheet.
- For paper after the 2nd sheet, the same operation as the 1st sheet of paper is performed.
- When the paper exit sensor (PS2) detects the trailing edge of the last sheet of paper, M1 and M2 turn OFF after a specified period of time.

[1]	Print start	[2]	Speed up the line speed for the 1st sheet of paper
[3]	Sheet detection time	[4]	Switching the line speed of M1 to accept the 2nd sheet of paper
[5]	Switching the line speed of M2 to accept the 2nd sheet of paper (The 1st sheet of paper is exited)	-	

(2) Double sheets reverse/exist conveyance

- When the start button turns ON[1], the entrance motor (M1) turns ON at the same low line speed as the machine.
- M1 turns ON at low speed and the entrance roller/1, /2 and the stacker entrance roller rotate at the same speed as the main body so that paper ejected from the main body is conveyed to the RU smoothly.
- When the paper exit sensor (PS3) detects the leading edge of the 1st sheet of paper, M1 switches from low speed to high speed of 1650mm/s after a specified period of time [2] and the line speed inside of the RU is accelerated.

- When M1 switches from low speed to high speed, the trailing edge of the 1st sheet of paper already passes the output roller. Therefore, M1 is not effected when the line speed of the RU is accelerated.
- When the entrance sensor (PS1) detects the trailing edge of the 1st sheet of paper, M1 switches to low speed again [3] after a specified period of time and is ready to accept the next sheet.
- When M1 switches from high speed to low speed, the conveyance of the 1st sheet of paper to the stacker section is completed.
- When the PS3 detects the leading edge of the 2nd sheet of paper, M1 switches from low speed to high speed [4] after a specified period of time as the same for the 1st sheet of paper. Then M1 accelerates the line speed.
- When the PS1 detects the trailing edge of the 2nd sheet of paper, M1 switches from high speed to low speed after a specified period of time [5] as the operation for the 1st sheet of paper and is ready to accept the 3rd sheet.
- The 2nd sheet of paper is stacked to the stacker section the same as the 1st sheet.
- After a specified period of time since the PS1 detects the trailing edge of the 2nd sheet of paper, the output motor (M2) rotates in the reverse direction [6]. Thus the output motor prevents the paper from nipping by the paper re-feed roller during alignment is operated for the 1st and 2nd sheet of paper.
- When the alignment operation is completed, M2 rotates in forward direction [7] after a specified period of time since PS1 detects the trailing edge of the 2nd sheet of paper and drives refeed roller, merging section roller, output roller at the line speed 1000mm/s.
- The 1st and 2nd sheets of papers have been pulled against the refeed roller after the alignment operation is applied. Thus, the rotation of M2 in the forward direction nips the papers so that 2 sheets of papers are exited being overlapped.
- 2 sheets of paper exited at a time reverses because they are conveyed from the side which was trailing edge when they were accepted to the stacker.
- During the double sheets reverse paper exit of the 1st and 2nd sheets of paper, the acceptance operation for the 3rd paper is performed at the same timing of the 1st and 2nd sheets.
- After a specified period of time since PS1 detects the trailing edge of the 3rd sheet of paper, M2 turns off the rotation in the forward direction [8] and completes the double reverse/exit conveyance for the 1st and 2nd sheet of paper.
- When the paper exit sensor (PS2) detects the trailing edge of the double sheets of reverse paper exit before a specified period of time starting on the time when PS1 detects the trailing edge of the 3rd sheet of paper, the former have a priority to be as the timing of completing the paper exiting of M2.
- For papers after the 3rd sheet, the operation for the 1st and 2nd sheets of papers is repeated and 2 sheets of papers are reversely exited being overlapped.
- When the number of total sheets of paper is odd, M2 rotates in forward [9] and reverse [10] direction since the PS1 detects the trailing edge of the last sheet of paper, and the reverse/exit conveyance only for the last page is performed.
- When only a sheet of paper is fed as a last sheet of paper, M2 turns OFF the reverse/exit conveyance in the forward rotation a specified period of time after M2 turns ON, and turns ON [11] again after a specified period of time to restart the reverse/exit conveyance.
- When only a sheet of paper is fed as a last sheet of paper, the reverse/exit conveyance stops temporarily so that the paper is transferred a fixed distance away from the former exited paper.
- M2 turns OFF after a specified period of time since the PS2 detects [12] the trailing edge of the last sheet of paper in both case of double and single reverse/exit conveyance.

[1]	Print start	[2]	Speed up the line speed for the 1st sheet of paper
[3]	Switching to the line speed for acceptance the 2nd sheet	[4]	Speed up the line speed for the 2nd sheet of paper

[7]	Double sheets reverse/exit for the 1st and 2nd sheets start	[8]	Double sheets reverse/exit for the 1st and 2nd sheets completion
[9]	Assist the alignment operation of the last sheet of paper when the number of sheets is odd.	[10]	Reversing/exiting conveyance of the last sheet of paper when the number of sheets is odd (Start)
[11]	Reversing/exiting conveyance of the last sheet of paper when the number of sheets is odd (Restart)	[12]	Detecting the trailing edge of the last paper

(3) Single sheet reverse/exit conveyance

- When the start button turns ON [1], the entrance motor (M1) turns ON at the same low speed as the machine.
- M1 turns ON at low speed and the entrance roller/1, /2 and the stacker entrance roller rotate at the same speed as the main body so that paper ejected from the main body is conveyed to the RU smoothly.
- When the paper exit sensor (PS3) detects the leading edge of the 1st sheet of paper, M1 switches from low speed to high speed of 1650mm/s after a specified period of time [2] and the line speed inside of the RU is accelerated.
- When M1 switches from low speed to high speed, the trailing edge of the 1st sheet of paper already passes the output roller. Therefore, M1 is not effected when the line speed of the RU is accelerated.
- When the entrance sensor (PS1) detects the trailing edge of the 1st sheet of paper, M1 switches to low speed again [3] after a specified period of time and is ready to accept the next sheet.
- When M1 switches from high speed to low speed, the conveyance of the 1st sheet of paper to the stacker section is completed.

- After a specified period of time since the PS1 detects the trailing edge of the 1st sheet of paper, the output motor (M2) rotates in the reverse direction [4]. Thus the output motor prevents the paper from nipping by the paper re-feed roller during alignment is operated for the 1st sheet of paper.
- When the alignment operation is completed, M2 rotates in forward direction [5] after a specified period of time since PS1 detects the trailing edge of the 1st sheet of paper and drives refeed roller, merging section roller, output roller at the line speed 1000mm/s.
- The 1st sheet of paper after the alignment operation contacts with the refeed roller, so it is nipped by the rotation in forward direction of M2 and ejected.
- Exited paper is reversed because they are conveyed from the side which was trailing edge when they were stacked to the stacker.
- When the paper exit sensor (PS2) detects the trailing edge of the 1st sheet of paper, M2 turns off the rotation in the reverse direction [6] and completes the reverse/exit conveyance for the 1st sheet of paper.
- For paper after the 2nd sheet, the same operation as the 1st sheet of paper is performed.

[1]	Print start	[2]	Speed up the line speed for the 1st sheet of paper
[3]	Switching to the line speed for acceptance the 2nd sheet	[4]	Alignment operation for the 1st sheet of paper assist

3. STACKER SECTION

3.1 Configuration

[1]	CD alignment plate /Rr	[2]	Assist guide
[3]	CD alignment plate /Fr	[4]	FD alignment plate
[5]	Stacker jam sensor (PS5)	[6]	Stack assist fan /Fr (FM1)
[7]	Stack assist fan /Rr (FM2)	-	

3.2 Drive

3.2.1 Assist guide drive

[1]	Timing belt	[2]	Stack switch motor (M6)
[3]	Actuator	[4]	Assist guide
[5]	Stack switch home sensor (PS8)	-	

3.2.2 CD alignment drive

[1]	CD alignment motor (M4)	[2]	CD alignment plate /Rr
[3]	Timing belt	[4]	CD alignment plate /Fr
[5]	CD alignment home sensor (PS4)	-	

3.2.3 FD alignment drive

[1]	FD alignment plate	[2]	FD alignment motor (M3)
[3]	FD alignment home sensor (PS3)	[4]	Timing belt

3.3 Operation

3.3.1 Conveyance path switching control

- The assist guide [1] switches the paper accepting path to the stacker section [8] and paper exit path from the stacker section [5].
- The angle of the assist guide changes according to the rotation of the pulley /2 [2].
- The stack switch motor (M6) [4] drives the pulley /2 via the timing belt [6] and the pulley /1 [3].
- The pulley /2 is equipped with the actuator [7], and the stack switch home sensor (PS8) [10] controls the rotation position. Thus, the assist guide has 2 set stopping positions.
- Pulley /2 stops at the home position when the stacker section accepts paper. At this time, the assist guide is opened.
- When the assist guide is opened, the conveyance path is made between the stacker entrance roller and the stacker section. Thus, the paper [9] which passed through the stacker entrance roller to perform the reverse paper exit is conveyed to the stacker section.

- When paper is ejected from the stacker section, the assist guide is closed and the conveyance path to the stacker entrance roller is blocked. The conveyance path of the paper re-feed roller leads so that the paper is exited. This operation reverses the paper.
- When the stacker section accepts paper, M6 does not operate and the assist guide keeps being opened.
- When the entrance sensor (PS1) detects the trailing edge of paper and turns OFF, M6 rotates in the reverse direction and closes the assist guide after a specified period of time. At this time, the trailing edge of the paper has passed the assist guide.
- When the paper conveyed to the stacker section is moved up by the vertical alignment operation, the closed assist guide conveys the paper is conveyed to the paper re-feed roller.
- After a specified period of time since the start of vertical alignment operation, M6 rotates in the forward direction and opens the assist guide again to enter the stand-by to accept the next sheet.

[1]	Assist guide	[2]	Pulley /2
[3]	Pulley /1	[4]	Stack switch motor (M6)
[5]	Paper exit path	[6]	Timing belt
[7]	Actuator	[8]	Paper accepting path
[9]	Paper (accepting conveyance)	[10]	Stack switch home sensor (PS8)
[11]	Paper (exit conveyance)	-	

3.3.2 Horizontal alignment control

(1) Horizontal alignment mechanism

- The CD alignment plates /Fr [6] and /Rr [2] align the paper in the cross direction.
- The CD alignment plates /Fr and /Rr are connected to the timing belt [5], and the drive of the CD alignment motor (M4) [1] moves them.
- M4 is equipped with the damper to make itself calm.
- The CD alignment plate /Rr is equipped with the actuator [3]. The CD alignment home sensor (PS4) controls the movement position of the CD alignment plate /Fr, /Rr.

[1]	CD alignment motor (M4)	[2]	CD alignment plate /Fr
[3]	Actuator	[4]	Stacker jam sensor (PS5)
[5]	Timing belt	[6]	CD alignment plate /Fr
[7]	CD alignment home sensor (PS4)		-

(2) Alignment timing

- When paper is accepted, the CD alignment plate /Fr and /Rr stand by at the position where 10mm distance from the edge of the paper.
- The operation for lining up edges of the CD alignment plate /Fr and /Rr is performed for 2 steps when single sheet reverse paper exit and 1 step when double sheets reverse paper exit.
- In the single sheet reverse paper exit, the edges are lined up for 8mm at mid speed after a specified period of time since entrance sensor (PS1) detects the trailing edge of the sheet.
- When vertical alignment is started after the operation described as above, the edges are lined up for 2mm at low speed in addition after a specified period of time.
- In the double sheets reverse paper exit, the edges are lined up for 10mm at high speed after a specified period of time since PS1 detects the trailing edge of the sheet.
- After a specified period of time since vertical alignment starts, the edges are lined up for 10mm for each at high speed by the CD alignment plate /Fr and /Rr. This operation is same for single sheet reverse paper exit and double sheets reverse paper exit.

(3) Paper in the stacker detection control

- The stack side of the stacker is equipped with the stacker jam sensor (PS5). It detects whether paper remains in the stacker or not.

3.3.3 Vertical alignment control

(1) Vertical alignment mechanism

- The FC alignment plate [1] aligns the paper in the feed direction.
- When the FD alignment plate goes up, the stacked paper strikes the paper re-feed roller. Then, the alignment in the feed direction is performed.
- The FD alignment motor (M3) [2] drives the FD alignment plate via the timing belt [5].
- M3 is equipped with the damper to make Machine calm.
- The timing belt is equipped with the actuator [4], and the FD alignment home sensor (PS3) [3] controls the moving position.

[1]	FD alignment plate	[2]	FD alignment motor (M3)
[3]	FD alignment home sensor (PS3)	[4]	Actuator
[5]	Timing belt	-	

(2) Alignment timing

- Vertical alignment operation is different for single sheet reverse paper exit and double sheets reverse paper exit.
- Single sheet reverse paper exit
 - For single sheet reverse paper exit, the FD alignment motor (M3) turns ON upon receiving a print job and the FD alignment plate [14] goes up from the home position [6] to the position [9] where the paper trailing edge is at a distant of 35mm [11] from the center [10] of the paper re-feed roller [12]. Then, the FD alignment plate remains at the position.
 - When the paper is conveyed to the stacker section, the FD alignment plate goes further up a specified period of time after the entrance sensor (PS1) detects the paper trailing edge. Then, the FD alignment plate strikes the paper trailing edge to the paper re-feed roller and paper re-feed driven roller [13] and performs alignment in the feed direction.
 - After another period of time, the FD alignment plate goes up again when the paper exit motor (M2) turns ON and the FD alignment plate assists the paper exit operation by the paper re-feed roller for a specified period of time.
 - After another period of time, the FD alignment plate goes down to the position where is at a distant of 35mm from the center of the paper re-feed roller. Then, the FD alignment plate enters the stand-by to receive the next paper.
- Double sheets reverse paper exit
 - For single sheet reverse paper exit, the FD alignment motor (M3) turns ON upon receiving a print job and the FD alignment plate [14] goes up from the home position [6] to the position [9] where the paper trailing edge is at a distant of 35mm [11] from the center [10] of the paper re-feed roller [12]. Then, the FD alignment plate remains at the position.
 - After a specified period of time since the entrance sensor (PS1) detects the trailing edge of the 1st sheet, the FD alignment plate goes further up to lift the trailing edge of the 1st sheet to the position [16] where is at a distant of 15mm [17] from the center of the paper re-feed roller.
 - Receives the 2nd sheet on the above condition.
 - After a specified period of time since the PS1 detects the trailing edge of the 2nd sheet, the FD alignment plate goes further up and hit the paper trailing edge against the paper re-feed roller and paper re-feed driven roller [13] to perform alignment in the feed direction.
 - The above operation shortens the time from receiving the 2nd sheet and completing the alignment.
 - Following operations are same as the single sheet reverse paper exit.

[1]	Vertical alignment position	[2]	Changes of single sheet reverse paper exit
[3]	Change of double sheets reverse paper exit	[4]	2nd sheet receiving position
[5]	1st sheet receiving position	[6]	Home position
[7]	FD alignment home sensor (PS3)	[8]	Paper length in the feed direction
[9]	Paper trailing edge for 1st sheet receiving	[10]	Center of the paper re-feed roller
[11]	35mm	[12]	Paper re-feed roller
[13]	Paper re-feed driven roller	[14]	FD alignment plate
[15]	1st sheet of paper	[16]	Paper trailing edge for 2nd sheet receiving
[17]	15mm	[18]	Assist guide
[19]	2nd sheet of paper	-	

3.3.4 Reverse/exit control

(1) Double sheets reverse/exit conveyance control

- When the start button turns ON [1], the FD alignment motor (M3) also turns on [2] and moves up the FD alignment plate to the position where the upper edge of paper to be stacked is 35mm distance from the center of the refeed roller at high speed.
- When the start button turns ON, the CD alignment motor (M4) also turns on [3]. The motor closes the CD alignment plate /Fr, /Rr to the position at high speed to the position where the both edges of the paper to stack are 10mm distance from the plate at high speed.
- The standby position to accept paper for both FD alignment plate and CD alignment plate/Fr, /Rr is as mentioned above.
- The 1st sheet of paper which is conveyed to the RU is conveyed to the stacker section via the straight gate and the stacker entrance roller from the entrance roller/2.
- When PS1 detects the trailing edge of the 1st sheet of paper, the stack switch motor [6] rotates in the reverse direction [4] and closes the assist guide after a specified period of time.
- When the assist guide is closed, the conveyance of the 1st sheet of paper to the stacker section is completed.
- After a specified period of time since PS1 detects the trailing edge of the 1st sheet of paper, M3 turns ON [5] and moves up the FD alignment plate at low speed to the position where the upper edge of stacked paper is 15mm distance from the center of the refeed roller.
- The standby position to accept the 2nd sheet of paper for the double sheets reverse paper exit is as mentioned above.
- When the 1st sheet of paper moves up, the assist guide is close and the conveyance path to the stacker entrance roller side is blocked, so the paper is conveyed to the re-feed roller side.
- After a specified period of time since M3 turn ON the position movement to accept the 2nd sheet of paper, M6 rotates in forward direction [6] and opens assist guide, and stands by to accept the 2nd sheet of paper.
- When the PS1 detects the trailing edge of the 2nd sheet of paper, M3 turns ON [7] after a specified period of time and moves down the FD alignment plate at arbitrary speed. Then M3 accepts the 2nd sheet of paper to the stacker position.
- When the PS1 detects the trailing edge of the 2nd sheet of paper, M6 rotates again in the reverse direction [8] and closes the assist guide after a specified period of time.
- After a specified period time since the PS1 detects the trailing edge of the 2nd sheet of paper, M3 turns ON [9] and moves up the FD alignment plate at high speed to perform vertical alignment for the 1st and 2nd stacked sheet of paper by contacting with the refeed roller.
- When the 1st and 2nd sheets of paper are moved up, the assist guide is closed and the conveyance path to the stacker entrance roller is blocked, so the paper is conveyed to the re-feed roller.

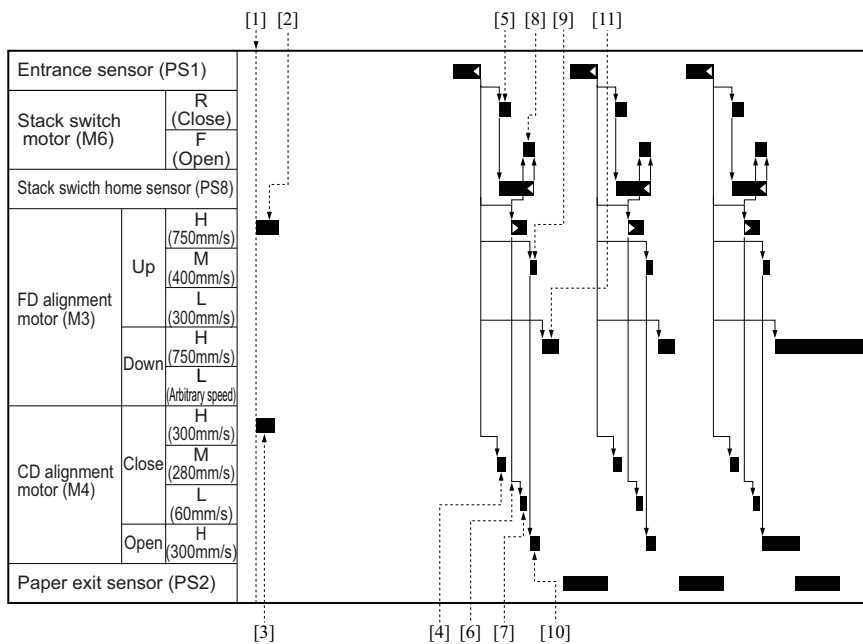

- M4 turns ON [10] after a specified period of time since M3 turns ON the vertical alignment. Then M4 closes the CD alignment plate /Fr and /Rr at high speed to perform horizontal alignment for the 1st and 2nd stacked sheets of paper.
- After a specified period of time since M3 turns ON the vertical alignment, M6 rotates in forward direction [11] and opens the assist guide to enter the stand-by for accepting the 3rd sheet of paper.
- After a specified period of time since PS1 detects the trailing edge of the 2nd sheet of paper, M3 turns ON [12] and moves up the FD alignment plate at mid speed so that the paper re-feed roller nips the aligned 1st and 2nd sheet of paper.
- Moving up distance for nip assistance operation of M3 is 10mm at the speed 400mm/s for plain and 23mm at the speed 600mm/s for tab paper.
- Aligned 2 sheets of paper are conveyed from the side which was trailing edge when they were stacked to the stacker. Therefore they reverses.
- M4 turns ON [13] at the same timing when M3 performs nip assist operation and opens the FD alignment plate /Fr, /Rr to enter the stand-by for accepting the 3rd sheet of paper.
- After a specified period of time since PS1 detects the trailing edge of 2nd sheet of paper, M3 turns ON [14] and moves down the FD alignment plate at high speed to enter the stand-by for accepting the 3rd sheet of paper.
- The position to standby for accepting the 1st and 3rd sheets of paper of FD alignment plate are the same.
- For papers after the 3rd sheet, the operation for the 1st and 2nd sheets of paper is repeated and 2 sheets of papers are reversely exited overlapped.
- When the number of total sheets of paper is odd, M4 turns ON [15] a specified period of time after PS1 detects the trailing edge of the last sheet of paper and closes the CD alignment plate /Fr and /Rr by 8mm for each at mid speed to perform the horizontal alignment of a sheet of paper.
- The position where the CD alignment plate /Fr and /Rr stop after they move at mid speed is 2mm from the paper edges. The horizontal alignment is not completed.
- After a specified period time since the PS1 detects the trailing edge of the last sheet of paper, M3 turns ON [16] and moves up the FD alignment plate at mid speed to perform vertical alignment for the stacked last sheet of paper by contacting it with the paper refeed roller.
- When the last sheet of paper moves up, the assist guide is close so that the conveyance path to the stacker entrance roller side is blocked and the paper is conveyed to the refeed roller side.
- M4 turns ON [17] a specified period of time after M3 turns ON the vertical alignment. Then, M4 closes the CD alignment plate /Fr and /Rr by 2mm for each to complete the horizontal alignment for the last stacked sheet of paper.
- The following operation for exiting papers is the same as the double reverse/exit conveyance.

[1]	Print start	[2]	FD alignment plate position movement to accept the 1st sheet
[3]	CD alignment plate /Fr, /Rr position movement to accept the 1st sheet	[4]	Assist the moving up the 1st sheet of paper of assist guide
[5]	FD alignment plate position movement to accept the 2nd sheet	[6]	Assist guide standby for accepting the 2nd sheet
[7]	FD alignment plate position movement to accept the 3rd sheet	[8]	Alignment assist for the 1st and 2nd sheets of paper of the assist guide
[9]	Vertical alignment of alignment FD alignment plate	[10]	Horizontal alignment of CD alignment plate /Fr, /Rr
[11]	Assist guide standby for accepting the 3rd sheet	[12]	FD alignment nip assist
[13]	CD alignment plate /Fr, /Rr position movement to accept the 3rd sheet	[14]	FD alignment plate position movement to accept the 3rd sheet
[15]	Horizontal alignment by the CD alignment plate /Fr, /Rr when the number of sheets is odd (1st step)	[16]	Vertical alignment by the FD alignment plate when the number of sheets is odd
[17]	Horizontal alignment by the CD alignment plate /Fr, /Rr when the number of sheets is odd (2nd step)	-	

(2) Single sheet reverse/exit control

- When the start button turns ON [1], the FD alignment motor (M3) also turns on [2]. Then the motor moves up the FD alignment plate at high speed to the position where the upper edge of the paper to stack is 35mm distance from the center of the refeed roller at.
- When the start button turns ON, the CD alignment motor (M4) also turns on [3]. The motor closes the CD alignment plate /Fr, /Rr to the position at high speed to the position where the both edges of the paper to stack are 10mm distance from the plate at high speed.
- The standby position to accept paper for both FD alignment plate and CD alignment plate /Fr, /Rr is as mentioned above.
- The 1st sheet of paper which is conveyed to the RU is conveyed to the stacker section via the straight gate and the stacker entrance roller from the entrance roller/2.
- When the entrance sensor (PS1) detects the trailing edge of the 1st sheet of paper, M4 turns OFF after a specified period of time. Then M4 closes the CD alignment plate /Fr and /Rr by 8mm for each at mid speed to perform horizontal alignment.
- The position where the CD alignment plate /Fr, /Rr stops after they move at mid speed is 2mm from the paper edges. The horizontal alignment is not completed.
- When PS1 detects the trailing edge of the 1st sheet of paper, the stack switch motor (M6) rotates in the reverse direction [5] after a specified period of time to close the assist guide.
- When the assist guide is closed, the conveyance of the 1st sheet of paper to the stacker section is completed.
- After a specified period time since the PS1 detects the trailing edge of the 1st sheet of paper, M3 turns ON [6] and lifts the FD alignment plate at high speed to perform the vertical alignment for the 1st stacked sheet of paper by contacting it with the paper refeed roller.
- When the 1st sheet of paper moves up, the assist guide is close and the conveyance path to the stacker entrance roller side is blocked, so the paper is conveyed to the re-feed roller side.
- M4 turns ON [7] after a specified period of time since M3 turns ON the vertical alignment. Then M4 closes the CD alignment plate /Fr and /Rr by 2mm for each to complete the horizontal alignment for the 1st stacked sheet of paper.
- After a specified period of time since M3 turns ON the vertical alignment, M6 rotates in forward direction [8] and opens the assist guide to enter the stand-by for accepting the 2nd sheet of paper.
- After a specified period of time since PS1 detects the trailing edge of the 1st sheet of paper, M3 turns on [9] and moves up the FD alignment plate at mid speed so that the paper re-feed roller nips the aligned 1st sheet of paper.
- Moving up distance for nip assistance operation of M3 is 10mm at the speed 400mm/s for plain and 23mm at the speed 600mm/s for tab paper.
- Aligned paper is conveyed from the side which was trailing edge when they were stacked to the stacker. Therefore they reverses.
- M4 turns ON [10] at the same timing when M3 performs nip assist operation and opens the FD alignment plate /Fr, /Rr to enter the stand-by for accepting the 2nd sheet of paper.
- After a specified period of time since PS1 detects the trailing edge of the 1st sheet of paper, M3 turns ON [11] and moves down the FD alignment plate at high speed to enter the stand-by for accepting the 2nd sheet of paper.
- The position to standby for accepting the 1st and 2nd sheets of paper of FD alignment plate are the same.
- For paper after the 2nd sheet, the same operation as the 1st sheet of paper is performed.

[1] Print start	[2] FD alignment plate position movement to accept the 1st sheet
[3] CD alignment plate /Fr, /Rr position movement to accept the 1st sheet	[4] Horizontal alignment of the CD alignment plate /Fr, /Rr (1st step)
[5] Alignment assist for the 1st sheet of paper of assist guide	[6] Vertical alignment of the FD alignment plate
[7] Horizontal alignment of the CD alignment plate /Fr, /Rr (2nd step)	[8] Assist guide standby for accepting the 2nd sheet
[9] FD alignment nip assist	[10] CD alignment plate /Fr, /Rr position movement to accept the 2nd sheet
[11] FD alignment plate position movement to accept the 2nd sheet	-

3.3.5 Stack assist fan control

- Stack assist fan /Fr (FM1) [3], /Rr (FM2) [1] is equipped to improve the performance of stacked paper separation.
- FM1, FM2 operates only in the reverse/exit mode.

- FM1, FM2 turns ON at the same time when the paper exit sensor (PS3) turns ON, and turns OFF at the same time when the paper exit sensor (PS2) detects the trailing edge of the last sheet of paper and turns OFF.

[1]	Stack assist fan /Rr (FM2)	[2]	Paper
[3]	Stack assist fan /Fr (FM1)	-	

PH THEORY OF OPERATION ZU-608

1. UNIT CONFIGURATION

[1]	Z-folding section	[2]	Conveyance section
[3]	Punch section	[4]	Punch scraps conveyance section

2. PAPER PATH

2.1 Straight mode/punch mode(for the small size paper : A5, 5-1/2 x 8-1/2)

2.2 Punch mode (excluding the small size paper)

2.3 Z-folding mode/punch + Z-folding mode

[1]	From the main body to the 1st folding	[2]	1st folding to the 2nd folding
[3]	From the 2nd folding to the paper exit		

3. CONVEYANCE/EXIT SECTION

3.1 Configuration

[1]	Gate solenoid/Up (SD602)	[2]	Conveyance sensor (PS601)
[3]	Conveyance encoder sensor (PS610)	[4]	Gate solenoid/Lw (SD601)
[5]	Exit sensor (PS609)		

3.2 Drive

3.2.1 Conveyance drive

[1]	Main motor (M606)	[2]	Gate /Up
[3]	1st folding roller	[4]	Conveyance roller
[5]	Registration roller	[6]	Registration motor (M601)
[7]	Exit roller	[8]	Gate /Lw
[9]	2nd folding roller		

3.2.2 Gate drive

[1]	Gate solenoid/Up (SD602)	[2]	Gate /Up
[3]	Gate /Lw	[4]	Gate solenoid/Lw (SD601)

3.3 Operation

3.3.1 Conveyance path switching

- The gates/Lw and /Up switch the conveyance path.
- The gate solenoid/Lw drives the gate/Lw respectively.
- The gate solenoid/Up drive the gate/Up respectively.

(1) Gate /Lw

- The gate/Lw switches the paper path between the straight conveyance path and the upper conveyance path.
- The gate/Lw is set to the straight conveyance path when the gate solenoid/Lw turns OFF.
- The gate/Lw is set to the upper conveyance path when gate solenoid/Lw turns ON.

[1]	Straight conveyance path	[2]	Gate solenoid/Lw (SD601)
-----	--------------------------	-----	--------------------------

[3] Upper conveyance path	[4] Gate /Lw
---------------------------	--------------

(2) Gate /Up

- The gate/Up switches the paper path of the paper that was conveyed to the upper conveyance path by the gate/Lw.
- The gate/Up is set to the paper path to the exit side when the gate solenoid/Up turns OFF.
- The gate/Up is set to the paper path to the 1st folding stopper when gate solenoid/Up turns ON.

[1] Gate solenoid/Up (SD602)	[2] Gate /Up
[3] Paper exit conveyance path	[4] 1st folding stopper
[5] Conveyance path to the 1st folding stopper	

(3) Operation timing**(a) Z-Folding**

1. In the Z-folding mode for the all paper size, the gate solenoid/Lw and the gate solenoid/Up turn ON when the paper edge sensor board detects the leading edge of the paper.
2. The gate/Lw is set to the upper conveyance path and the gate/Up is set to the conveyance path to the 1st folding stopper.
3. The gate solenoid/Lw and the gate solenoid/Up turn OFF a specified period of time after the last paper turns OFF the exit sensor.

**(b) Punch mode for the small size paper (A5, 5-1/2 x 8-1/2)**

- Gate solenoids/Lw and gate solenoids/Up always remain OFF, and never turn ON.
- The gate/Lw remains being set to the straight conveyance path.

(c) Punch mode for the large size paper (other than the small size paper)

- The gate solenoid/Lw turns ON when the paper edge sensor board detects the leading edge of the paper.
- The gate/Lw is set to the upper conveyance path.
- The gate solenoid/Up remains OFF and the gate/Up remains being set to the paper path to the exit side.
- The gate solenoid/Lw turns OFF a specified period of time after the last paper turns OFF the exit sensor.

(d) Straight paper exit

- Gate solenoids/Lw and gate solenoids/Up always remain OFF, and never turn ON.
- The gate/Lw remains being set to the straight conveyance path.

3.3.2 Conveyance line speed switching

- The main motor drives the conveyance drive roller, the 1st folding roller, and the 2nd folding roller, which perform the folding operation, as well as the conveyance roller and the exit roller.
- The paper edge sensor board, the conveyance sensor, and the exit sensor detect the paper.

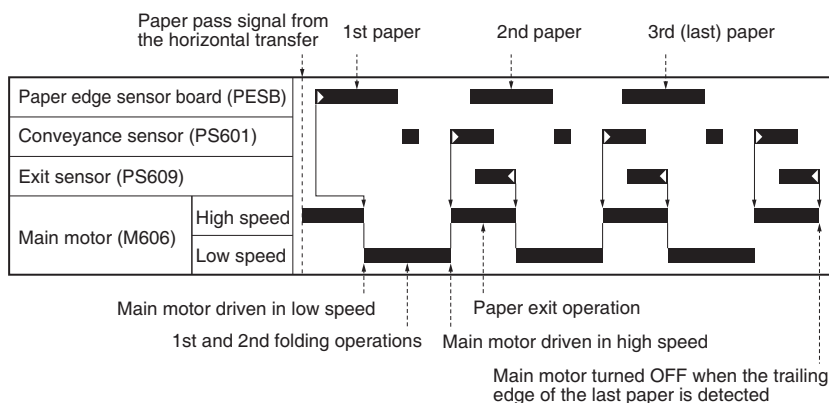

[1]	Conveyance drive roller	[2]	1st folding roller
[3]	Conveyance roller	[4]	Paper edge sensor board (PESB)
[5]	Registration roller	[6]	Exit sensor (PS609)
[7]	Exit roller	[8]	Conveyance sensor (PS601)
[9]	2nd folding roller		

(1) Operation timing

(a) Z-Folding

1. Transmitting the paper pass signal from the horizontal transfer, the main motor turns ON and rotates in high speed.
2. The main motor rotates in low speed and perform the 1st and 2nd folding operations a specified period of time after the paper edge sensor board detects the leading edge of the paper.
3. The main motor rotates in high speed to perform the paper exit operation of the 1st paper and to convey the 2nd paper in sync with the paper exit speed of the main body when the conveyance sensor detects the leading edge of the paper and turns ON after the 2nd folding operation.
4. The main motor turns OFF when the exit sensor detects the trailing edge of the last paper.

(b) Punch + Z-folding

1. Transmitting the paper pass signal from the horizontal transfer, the main motor turns ON and rotates in high speed.
2. The main motor rotates in low speed and perform the 1st folding operations a specified period of time after the paper edge sensor board detects the leading edge of the paper.
3. The main motor turns OFF for the punching operation a specified period of time after paper edge sensor board detects the trailing edge of the paper.
4. The main motor turns OFF when the exit sensor detects the trailing edge of the last paper.

5. The main motor rotates in high speed to perform the paper exit operation of the 1st paper and to convey the 2nd paper in sync with the paper exit speed of the main body when the conveyance sensor detects the leading edge of the paper and turns ON after the 2nd folding operation.
6. The main motor turns OFF when the exit sensor detects the trailing edge of the last paper.

3.3.3 Registration control

- Registration control corrects the tilt of paper during the Z-folding or the punching.
- The paper exited from the main body is pressed against the stopped registration roller and forms a loop to correct skew of the paper, and then the paper is conveyed with its leading edge nipped.
- The registration motor drives the registration roller.

[1]	Paper leading edge	[2]	Loop
[3]	Registration motor (M601)	[4]	Registration roller

(1) Operation timing

(a) Punch + Z-folding

1. Transmitting the paper pass signal from the horizontal transfer, the registration motor turns ON.
2. The registration motor stops a specified period of time after the paper edge sensor board detects the leading edge of the paper conveyed from the main body.
3. The paper is pressed against the registration roller and forms a loop to correct paper skew.
4. The registration motor turns ON and the conveyance is restarted a specified period of time after the paper contacts with the registration roller.
5. The registration motor turns OFF a specified period of time after the paper is exited.
- No registration control is conducted in the straight mode.

4. PUNCH SECTION

4.1 Configuration

[1] Punch home sensor (PS606)	[2] Paper edge sensor board (PESB)
[3] Punch switchover switch (MS601)	

4.2 Drive

[1] Eccentric cam	[2] Punch clutch (CL601)
[3] Punch motor (M604)	[4] Punch shift motor (M605)
[5] Belt	[6] Rack
[7] Punch blade	[8] Punch switchover motor (M608)
[9] Punch switchover cam	[10] Cam cover
[11] Cam holder	

4.3 Operation

- The punch operation is conducted for every paper.
- The controls related to the punch operation is the punch control, the punch position movement control, and the punch hole switching control.

4.3.1 Punch control

- The punch operation is conducted by transmitting the rotation of the punch motor to the eccentric cam by the punch clutch and reciprocating the punch blades connected to the cam holder once.
- The punch motor drives the eccentric cam and performs the punch operation when punch clutch turns ON.

- The punch motor rotates clockwise from the view of the rear.
- The punch motor keeps rotating during the punch operation.
- The punch home sensor detects the home position of the punch blades.

[1]	Eccentric cam	[2]	Cam holder
[3]	Punch home sensor (PS606)	[4]	Punch motor (M604)
[5]	Punch clutch (CL601)	[6]	Punch blade
[7]	Paper		

(1) Operation timing

- The registration motor and the main motor turn OFF to stop the conveyance during the punch operation.
1. The punch motor turns ON when the paper edge sensor board detects the leading edge of the paper.
 2. The punch clutch turns ON and performs the punch operation a specified period of time after the paper edge sensor board detects the trailing edge of the paper.
 3. The punch clutch turns OFF after a specified period of time.
 4. The punch motor turns OFF a specified period of time after the punch clutch turns OFF.
 5. After the punch operation, the registration motor and the main motor turn ON to exit the paper.

4.3.2 Punch unit position movement control

- The punch shift motor moves the punch unit to move the punch hole position in the main scan direction.
- The registration motor controls the punch position in the sub scan direction by its stop position.
- The sensors of the paper edge sensor board detects the punch hole position.
- The front side sensor among 5 sensors detects the leading/trailing/side edge of the paper and the other 4 sensors detect the side edge of the paper. The different sensor is used depending on the paper size.
- The punch shift home sensor detects the home position.

[1]	Belt	[2]	Punch shift motor (M605)
[3]	Punch shift home sensor (PS605)	[4]	Punch unit
[5]	Side edge sensors	[6]	Leading/trailing/side edge sensor
[7]	Paper edge sensor board (PESB)		

(1) Standby position movement of the punch unit

- In the punch mode, the punch unit is set to the standby position in accordance with the paper size before the paper is conveyed.
- The punch shift motor moves the punch unit so that the sensor corresponding to the paper size among 5 sensors of the paper edge sensor board (in case of A4 paper, the sensor is used) is positioned 5 mm inward from the side edge of the paper.
- This operation is not conducted in the no punch mode.

[1]	Side edge of the paper	[2]	Punch shift motor (M605)
[3]	Punch unit	[4]	Punch blade
[5]	Paper edge sensor board (PESB)	[6]	Standby position

(2) Punch position correction

- The punch unit positioned 5 mm inward from the side edge of the paper conducts the punch position correction operation by moving the punch unit back and forth while conveying the paper to correct the misalignment between the conveyed paper and the punch position.
1. Move the punch unit backward until the certain side edge sensor (in case of A4 paper) detects the side edge of the paper.
 2. Then, move the punch unit forward until the side edge sensor detects the side edge of the paper (the side edge reference position detection).
 3. Move the punch unit forward further so that the center of the punch blades is positioned to the center of the paper.

[1]	Side edge of the paper	[2]	Paper edge sensor board (PESB)
[3]	Center of the paper	[4]	Paper conveyance direction
[5]	Punch blade	[6]	Punch unit
[7]	Center of the punch	[8]	Standby position

4.3.3 Punch hole switching control

1. Transmitting the paper pass signal from the horizontal transfer, the punch switchover motor switches the number of holes in the punch mode.
2. The punch switchover motor rotates the punch switchover cam clockwise and moves the eccentric cams and back and forth via the cam cover.
3. When switching between the 2 holes punching and the 4 holes punching in Metric Type, 2 eccentric cams in the middle remain being held in the cam holders because they are shared in both cases.
4. When the cam cover moves forward, the eccentric cams at the outside for the 4 holes punching are held in the cam holder so that the total of 4 eccentric cams are driven.
5. When the cam cover move backward, 2 outside eccentric cams are disengaged.
6. For the switchover between the 2 holes punching and the 3 holes punching in Inch Type, the 2 holes eccentric cams and the 3 holes eccentric cams work exclusively.
7. When the cam cover moves forward, the 3 holes eccentric cams are held in the cam holder and the 2 holes eccentric cams are disengaged.
8. This operation is not conducted if the number of holes is same with the previous printing.

[1]	Cam cover	[2]	Cam holder
[3]	Eccentric cam (4 holes)	[4]	Eccentric cam (2 holes/4 holes)
[5]	Punch switchover motor (M608)	[6]	Punch switchover switch (MS601)
[7]	Punch switchover cam		

5. PUNCH-HOLE SCRAPS CONVEYANCE SECTION

5.1 Configuration

[1]	Punch scraps conveyance motor (M607)	[2]	Punch scraps box set sensor (PS607)
[3]	Punch scraps full sensor (PS608)		

5.2 Drive

[1]	Punch scraps conveyance screw gear	[2]	Punch scraps conveyance motor (M607)
-----	------------------------------------	-----	--------------------------------------

5.3 Operation

5.3.1 Punch-hole scraps conveyance control

- The punch scraps are conveyed by the punch scraps conveyance screw driven by the punch scraps conveyance motor.
- The punch scraps conveyance motor turns ON to rotate the punch scraps conveyance screw a specified period of time after the paper edge sensor detects the trailing edge of the paper in the punch mode.
- The punch scraps are sent to the forward by the rotation of the screw and collected in the punch scraps box via the punch scraps collective duct.

[1]	Punch scraps conveyance screw	[2]	Punch scraps conveyance motor (M607)
[3]	Punch waste box	[4]	Punch scraps collective duct

5.3.2 Punch-hole scraps box control

- The punch scraps box set sensor and the punch scraps full sensor monitor the punch scraps box.

[1]	Punch scraps full sensor (PS608)	[2]	Punch waste box
[3]	Punch scraps box set sensor (PS607)		

(1) Punch-hole scraps box full detection

- The punch scraps full sensor detects whether the punch scraps box is full or not.
- The punch scraps full sensor turns ON and transmits the punch scraps full signal to the main body when the punch scraps box becomes full of punch scraps, and then the main body displays the message on its operation panel.

(2) Punch-hole scraps box detection

- The punch scraps box set sensor detects whether the punch scraps box is housed or not.
- The punch scraps box set sensor and the punch scraps full sensor monitor the punch scraps box.

6. Z-FOLDING

6.1 Configuration

[1]	1st folding stopper home sensor (PS603)	[2]	2nd folding stopper home sensor (PS604)
[3]	Exit sensor (PS609)	[4]	Conveyance sensor (PS601)

6.2 Drive

<1st folding stopper drive>

<2nd folding stopper drive>

[1]	1st folding stopper	[2]	1st folding stopper home sensor (PS603)
[3]	1st folding stopper motor (M602)	[4]	2nd folding stopper motor (M603)
[5]	2nd folding stopper	[6]	2nd folding stopper home sensor (PS604)

6.3 Operation

6.3.1 1st folding control

1. The registration roller, the conveyance roller, and the 1st folding roller convey the paper to the 1st folding stopper section via the gate/Up.
2. A loop is formed between the 1st folding roller and the conveyance drive roller when the leading edge of the paper is pressed against the 1st folding stopper.
3. The loop grows, and then it is caught by these rollers and the 1st folding is conducted.
4. The paper is then conveyed to the 2nd folding stopper section.
5. The position of the 1st folding depends on the position of the 1st folding stopper.
6. In the Z-folding mode with the punch mode, the registration motor and the main motor stops to conduct the punch operation after the 1st folding operation. Then the registration motor and the main motor turns ON to conduct the 2nd folding operation.

[1]	1st folding stopper	[2]	Gate /Up
[3]	Conveyance roller	[4]	Registration roller
[5]	1st folding roller	[6]	Loop
[7]	Conveyance drive roller	[8]	1st folding stopper home sensor (PS603)

(1) Operation timing

1. The 1st folding stopper motor turns ON to drive the 1st folding stopper to the appropriate position in accordance with the paper size a specified period of time after transmitting the paper pass signal from the horizontal transfer.
2. Transmitting the termination signal from the main body, the 1st folding stopper motor replaces the 1st folding stopper to the home position.

6.3.2 2nd folding control

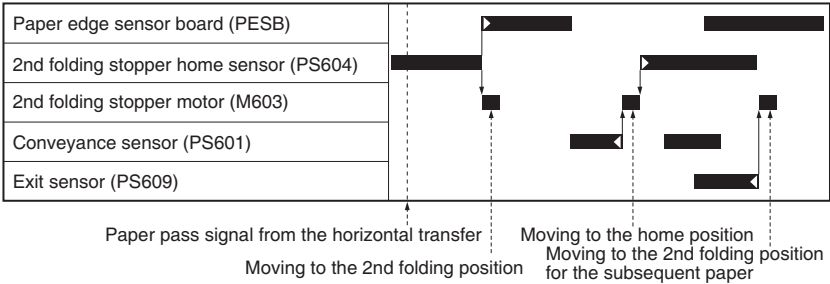

1. The paper conveyed from the 1st folding section to the 2nd folding section is stopped by the 2nd folding stopper.
2. Form a loop between conveyance drive roller and the 2nd folding roller.
3. The loop grows, and then it is caught by these rollers and the 2nd folding is conducted.
4. The 2nd folding stopper motor turns ON when the trailing edge of the paper (1st folding) conveyed to the paper exit direction passes the conveyance sensor.

[1]	Conveyance drive roller	[2]	1st folding roller
[3]	2nd folding stopper (Home position)	[4]	Exit sensor (PS609)
[5]	2nd folding stopper (Folding position)	[6]	2nd folding stopper home sensor (PS604)
[7]	Conveyance sensor (PS601)	[8]	2nd folding roller
[9]	Loop	[10]	Direction of paper exit

(1) Operation timing

1. The 2nd folding stopper motor turns ON to drive the 2nd folding stopper to the appropriate position in accordance with the paper size when the paper edge sensor board detects the leading edge of the paper.
2. The 2nd folding stopper motor rotates in the reverse direction to move the 2nd folding stopper to the home position when the conveyance sensor detects the trailing edge of the paper after the 2nd folding. It opens the paper exit path.
3. The 2nd folding stopper motor turns ON to replace the stopper to the original position for the subsequent Z-folding when the exit sensor detects the trailing edge of the paper.

PI THEORY OF OPERATION FS-532

1. UNIT CONFIGURATION

[1]	Paper conveyance section	[2]	Stapler section
[3]	Stacker section	[4]	Main tray section

[3]	Conveyance gate /Lw	[4]	Conveyance gate /Up
[5]	Cam	[6]	Conveyance gate motor (M22)

3.2.2 Bypass conveyance roller/stacker entrance roller drive

[1]	Bypass conveyance roller /1	[2]	Bypass conveyance roller /2
[3]	Stacker entrance motor (M5)	[4]	Stacker entrance roller

3.2.3 Sub tray conveyance roller/PK exit roller/stacker conveyance roller drive

[1]	FNS conveyance motor /2 (M2)	[2]	Stacker conveyance roller
[3]	PK exit roller	[4]	Sub tray conveyance roller /1
[5]	Sub tray conveyance roller /2	-	

3.2.4 Sub tray exit roller/horizontal conveyance roller drive

[1]	Sub tray exit roller	[2]	Horizontal conveyance roller /1
[3]	Horizontal conveyance roller /2	[4]	FNS conveyance motor /3 (M3)

3.2.5 Bypass gate drive

[1]	Bypass gate /Rt	[2]	Bypass gate /Lt
[3]	Cam	[4]	Bypass gate motor (M25)

3.3 Operation

3.3.1 Line speed switch control

- The line speed of FS-532 is 1000 mm/s.
- When the line speed of paper conveyed to FS-532 is slower than 1000mm/s, the speed is reduced at receiving the paper.
- Refer to the following table for basic line speed. However, the deceleration of the line speed varies according to the print mode, weight or the type of the main body which connects FS-532.

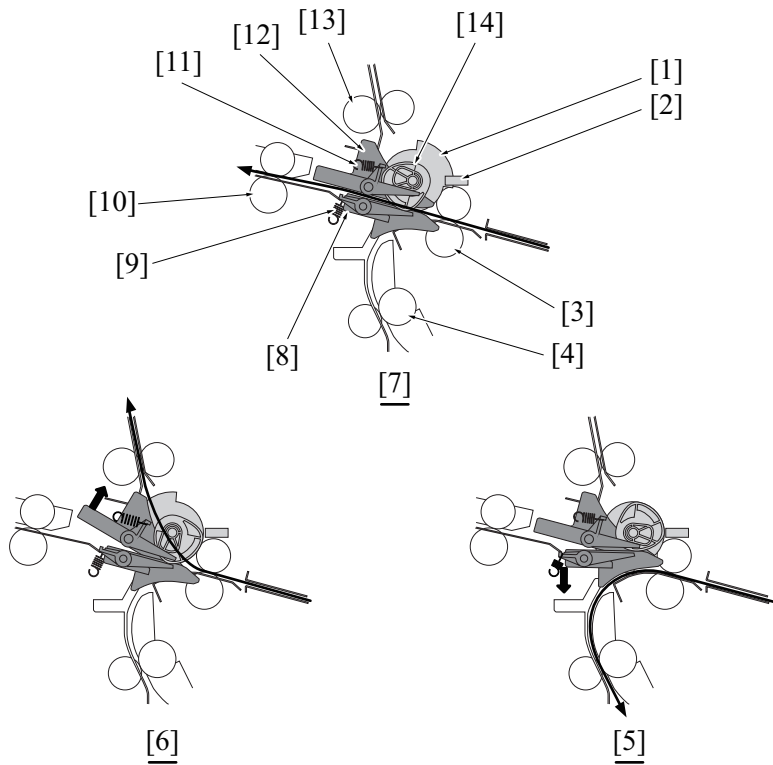

Machine name	CPM	Print mode				
		Simplex (Face up)	1 side reverse (Face down)	Duplex	Thick Simplex/Duplex	Thick 1 side reverse
1250/1250P	125	1000mm/s	1000mm/s	1000mm/s	1000mm/s	1000mm/s
1052	105	490mm/s	1000mm/s	490mm/s	330mm/s	750mm/s
951	95	460mm/s	1000mm/s	460mm/s	290mm/s	600mm/s

- When the line speed is 1000mm/s print mode, the line speed is not switched.
- The deceleration timing of the line speed is after a specified period of time since the FNS entrance sensor (PS1) detects the leading edge of paper.
- The reduced line speed is returned to 1000mm/s by the acceleration enable signal that is given from the main body.
- The timing when the acceleration enable signal is given varies depending on the previous option type and whether the main body decurler is used or not.
- When the acceleration enable signal is given, the speed of the motor that drives the roller to which the paper leading edge does not reach is not changed but fixed to 1000mm/s to rotate.

3.3.2 Conveyance path switching control

(1) Conveyance gate control

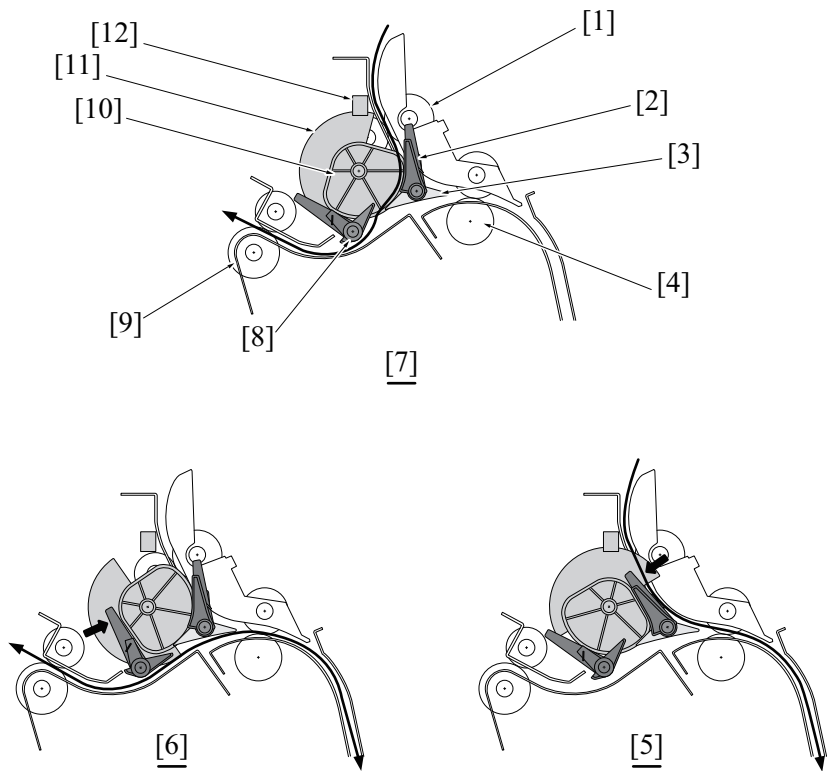

- Conveyance gate switches the straight conveyance path [7], the sub tray conveyance path [6], and the stacker/SD conveyance path [5].
- The conveyance gate consists of the conveyance gates /Up [12] and /Lw [8]. It has 3 patterns to be changed according to the rotation of the cam [14].
- The conveyance gate motor (M22) drives the cam.
- The cam is equipped with the actuator [1]. The conveyance gate home sensor (PS31) [2] controls the rotation position.
- In the straight conveyance, both of the conveyance gates /Up and /Lw are open according to the home position of the cam.
- Paper that is reached the PK exit roller [3] is conveyed to the horizontal conveyance roller /1 [10] through the space between the conveyance gates /Up and /Lw.
- In the sub tray conveyance, the cam depresses the tip of the conveyance gate /Up.
- Since the conveyance gate /Lw keeps the same position as the straight conveyance, the conveyance gate is closed.
- Paper that is conveyed from the PK exit roller is conveyed to the sub tray conveyance roller /1 [13] led by the conveyance gate /Up.
- In the stacker/SD conveyance, the depression force by the cam is released. Therefore, the force of the spring [9] lifts up the tip of the conveyance gate /Lw.
- Since the conveyance gate /Up keeps the same position as the straight conveyance, the conveyance gate is closed.
- Paper that is conveyed from the PK exit roller is conveyed to the stacker conveyance roller [4] led by the conveyance gate /Lw.
- The timing to switch the conveyance path of M22 varies depending on whether it is at the start of the job or during the job.
- In case the conveyance path is switched at starting the job, it is executed when the main body starts the paper feed operation.
- In case the conveyance path is switched during the job, it is executed after a specified period of time since the FNS entrance sensor (PS1) detects the trailing edge of the last page of the previous job.

[1] Actuator	[2] Conveyance gate home sensor (PS31)
[3] PK exit roller	[4] Stacker conveyance roller
[5] Stacker/SD conveyance path	[6] Sub tray conveyance path
[7] Straight conveyance path	[8] Conveyance gate /Lw
[9] Spring	[10] Horizontal conveyance roller /1
[11] Spring	[12] Conveyance gate /Up
[13] Sub tray conveyance roller /1	[14] Cam

(2) Bypass gate control

- The bypass gate switches the path of the paper that is reached the stacker/SD conveyance path to the stacker conveyance path, the overlap paper conveyance path, or the SD conveyance path.
- The bypass gate consists of the bypass gates /Rt [2] and /Lt [8]. It has 3 patterns to be changed according to the rotation of the cam [10].
- The bypass gate motor (M25) drives the cam.
- The cam is equipped with the actuator [11]. The bypass gate home sensor (PS36) [12] controls the rotation position.
- In the stacker conveyance, both of the bypass gates /Rt and /Lt are open according to the home position of the cam.
- Paper that reaches the stacker conveyance roller [1] is conveyed to the stacker entrance roller [9] via the left side of the bypass gate /Rt and the bypass fix gate [3] and the lower side of the bypass gate /Lt.
- In the overlap paper conveyance, the depression of the cam is released and the tip of the bypass gate /Lt is depressed.
- The bypass gate /Rt is open but the conveyance path between the stacker conveyance roller and the stacker entrance roller is closed.
- The stacker entrance roller switches back paper. The paper is conveyed to the bypass conveyance roller /1 [4] via the lower side of the bypass fix gate.
- In the SD conveyance, the pressure of the cam is released and the tip of the bypass gate /Rt moves to the left.
- The bypass gate /Lt is open but the conveyance path between the stacker conveyance roller and the stacker entrance roller is closed.
- Paper that is reached the stacker conveyance roller is conveyed to the bypass conveyance roller /1 via the right side of the bypass gate /Rt and the right side of the bypass fix gate.
- The timing to switch the conveyance path of M25 varies depending on the print mode. For details, refer to "[PI.5. Stacker section](#)".

4. SUB TRAY SECTION

4.1 Configuration

[1]	Sub tray exit sensor (PS8)	[2]	Sub tray
[3]	Sub tray paper full sensor (PS9)	[4]	Sub tray exit roller

4.2 Drive

For details, refer to "PI.3.2.3 Sub tray conveyance roller/PK exit roller/stacker conveyance roller drive" and "PI.3.2.4 Sub tray exit roller/horizontal conveyance roller drive".

4.3 Operation

4.3.1 Sub tray paper exit control

(1) Normal mode

- The FNS entrance motor (M1) that drives the FNS entrance roller, the FNS conveyance motor /2 (M2) that drives the PK exit roller and the sub tray conveyance rollers /1 and /2, and the FNS conveyance motor /3 (M3) that drives the sub tray paper exit roller turn ON simultaneously by the print start signal.
- When the sub tray exit sensor (PS8) detects the leading edge of the conveyed paper and turns ON, M3 reduces the rotation speed after a specified period of time.
- When PS8 detects the trailing edge of the paper and turns OFF, M3 returns to the high speed rotation after a specified period of time.
- M3 reduces the speed for each sheet, and it prevents the misalignment of paper that is ejected on the sub tray.
- M1, M2 and M3 keep turning ON during printing. However, each motor turns OFF after a specified period of time when there is no conveyance paper from the main body and there is no paper in the drive conveyance path of M1, M2 or M3.

(2) Punch mode

- In the punch mode, the FNS conveyance motors /2 (M2) turns ON by the print start signal [1].
- The FNS entrance motor (M1) turns ON after a specified period of time since the FNS entrance sensor (PS1) detects the leading edge of paper and turns ON.
- When PS1 detects the trailing edge of the paper and turns OFF, M1 and M2 turn OFF after a specified period of time.
- When the conveyed paper stops and the punch is executed [2], M2 turns ON again.
- During punching, the operation of M3 varies depending on the paper length in the feed direction.
- When the paper length in the feed direction is 336.8mm or shorter, M3 keeps ON state.
- When the paper length in the feed direction is 336.8mm or longer, M3 turns OFF/ON in synchronization with turning OFF/ON of M2.
- When the paper is conveyed to the sub tray exit sensor (PS8), M3 reduces the speed [3] according to the ON/OFF of PS8.
- A decelerating operation prevents the misalignment of paper ejected on the sub tray.

[1]	Print start signal	[2]	Punch
-----	--------------------	-----	-------

[3]	1st sheet of paper Deceleration	-
-----	---------------------------------	---

4.3.2 Sub tray paper full detection control

- The sub tray paper full sensor (PS9) [2] turns ON when paper that has been exited into the sub tray gets to the specified thickness or fixed output quantity (thin paper) continuously
- When PS9 turns ON, "Sub tray paper full" is displayed on the main body control panel.
- When output quantity is over the fixed quantity while in the thin paper exit, "Sub tray paper full" is displayed on the main body control even PS9 does not turn ON.

5. STACKER SECTION

5.1 Configuration

[1]	Rear stopper /Rr	[2]	Rear presser /Rr
[3]	Rewind paddle	[4]	Rear stopper /Md
[5]	Large size paper alignment fan (FM1)	[6]	CD alignment plate /Fr
[7]	FD alignment plate	[8]	Stack plate
[9]	CD alignment plate /Rr	[10]	Stack assist plate

5.2 Drive

5.2.1 Stacker entrance roller pressure release drive

[1]	Stacker entrance roller *1	[2]	Stacker entrance driven roller
[3]	Arm	[4]	Actuator
[5]	Roller pressure motor (M27)	[6]	Cam

*1 For the drive of the stacker entrance roller, refer to [PI.3.2.2 Bypass conveyance roller/stacker entrance roller drive](#).

5.2.2 Rewind paddle pressure release/rewind paddle drive

[1]	Timing belt (for driving the pressure release)	[2]	Rewind paddle release motor (M28)
[3]	Pressure release gear	[4]	Pressure release drive shaft
[5]	Rewind paddle	[6]	Pressure release support arm
[7]	Timing belt (for driving the rewind paddle)	[8]	Actuator
[9]	Rewind paddle	[10]	Stacker entrance roller *1

*1 For the drive of the stacker entrance roller, refer to [PI.3.2.2 Bypass conveyance roller/stacker entrance roller drive](#).

5.2.3 Stack assist plate drive

[1]	Arm	[2]	Actuator
[3]	Stack assist plate	[4]	Stacker entrance driven roller
[5]	Cam	[6]	Stack assist motor (M8)
[7]	Spring	-	

5.2.4 Alignment plate/rear stopper drive/bundle exit claw drive

[1]	Small size paper alignment motor (M18)	[2]	Stacker alignment motor (M9)
[3]	Stacker rear stopper motor (M20)	[4]	Timing belt (for driving the rear stopper /Fr, /Rr)
[5]	Rear stopper /Rr	[6]	Rear stopper /Md
[7]	Rear stopper /Fr	[8]	Stacker movement motor (M19)

[9]	Timing belt (for driving the rear stopper /Md)	[10]	Actuator
[11]	CD alignment plate /Fr	[12]	FD alignment plate
[13]	Timing belt (for driving the CD alignment plate /Fr, /Rr)	[14]	CD alignment plate /Rr
[15]	Bundle exit claw	-	

5.2.5 Paper pressure drive

[1]	Pressure lever	[2]	Stacker paper press motor (M21)
[3]	Actuator	[4]	Rear presser /Fr
[5]	Rear presser /Rr	-	

5.3 Operation

5.3.1 Paper overlap control

(1) Switchback control

- In the staple mode, the subsequent sheets to be stapled are overlapped and stacked in the bypass conveyance section [4] during the waiting period. It shortens the time for starting the subsequent stapling.
- The 1st sheet of the overlapped paper is conveyed from the stacker conveyance roller [2] that is driven by the FNS conveyance motor /2 (M2) to the stacker entrance roller [7] that is driven by the stacker entrance motor (M5). (A)
- When the paper overlap sensor /1 (PS32) [1] detects the trailing edge of the paper and turns OFF, the rotation of M5 is switched from reverse to forward after a specified period of time to convey the paper in the reverse direction.
- Since the bypass gate /Lt is closed, the paper is conveyed to the bypass conveyance roller /1 that is driven by M5. (B)
- The stacker conveyance roller keeps the forward rotation while the stacker entrance roller and the bypass conveyance roller /1 turn reverse. Therefore, the 2nd sheet of the overlapped paper [10] is conveyed. (C-1, C-2)
- When the paper overlap sensor /2 (PS33) [3] detects the trailing edge of the 1st sheet and turns OFF, the reverse rotation of M5 turns OFF after a specified period of time.
- When PS32 detects the leading edge of the 2nd sheet and turns ON, M5 turns forward after a specified period of time.
- When M5 turns forward, the 1st sheet is conveyed to the stacker entrance roller side again. (D)
- The 2nd sheet that is conveyed from the stacker conveyance roller and the 1st sheet that is conveyed from the bypass conveyance roller /1 are overlapped. (E)
- These operations are repeated to overlap paper during stapling.
- The overlap conveyance is available only for the Plain, Fine, Coated, and Book/News paper.
- By using the DIPSW, the weight of paper for the overlap conveyance can be selected; 50 to 91g/m² or 92 to 216g/m².
- The overlap conveyance is not executed in the mixed mode.
- The feed length of paper for the overlap conveyance is 297mm or shorter.
- The feed length of paper for the overlap conveyance is 229mm or shorter in the punch staple mode.

[1] Paper overlap sensor /1 (PS32)	[2] Stacker conveyance roller
[3] Paper overlap sensor /2 (PS33)	[4] Bypass conveyance path
[5] Bypass conveyance roller /1	[6] 1st sheet of paper
[7] Stacker entrance roller	[8] Stacker entrance driven roller
[9] Bypass gate /Lt	[10] 2nd sheet of paper

(2) Stacker entrance roller pressure release control

- By releasing the pressure, the stacker entrance driven roller moves up and down.
- The arm moves the stacker entrance driven roller up and down.
- In the overlap control of paper whose feed length is 229mm or shorter, the roller pressure motor (M27) turns ON after specified period of time since the FNS entrance sensor (PS1) detects the leading edge of the paper and turns ON. Then the pressure of the stacker entrance roller is released.
- The cam is equipped with the actuator. The roller pressure motor home sensor (PS34) controls the rotation position.

(3) Overlap control (Feed length 229mm or shorter)

- When the paper overlap sensor /1 (PS32) detects the leading edge of the 2nd sheet and turns OFF, the stacker entrance motor (M5) rotates in the reverse direction to switch back the paper after a specified period of time.
- When the paper overlap sensor /2 (PS33) [1] detects the trailing edge of the 1st sheet and turns ON according to the switch back, the reverse rotation of M5 turns OFF after a specified period of time.
- When PS32 detects the leading edge of the 2nd sheet and turns ON, M5 turns forward to convey the 1st sheet back in the original direction. The 1st sheet is conveyed with being overlapped on the 2nd sheet at this time.

- When PS32 detects the leading edge of the 2nd sheet and turns OFF, M5 rotates in the reverse direction to switch back the 1st sheet and the 2nd sheet overlap each other after a specified period of time.
- When PS32 detects the leading edge of the 3rd sheet and turns ON, it conducts the same operation. Then convey the 3 sheets at a time to the stacker section.

[1]	End of the front staple conveyance	[2]	Switch back the 1st sheet
[3]	Conveyance of 2 pages at a time	[4]	Switch back the 1st and 2nd sheet
[5]	Conveyance of 3 sheets at a time	-	

5.3.2 Stacker entrance roller pressure release control

- When the paper whose feed length is 230mm or longer is fed in the punch staple mode, the pressure of the stacker entrance roller [1] is released during the punching operation.
- By releasing the pressure, the stacker entrance driven roller [2] moves up and down.
- The arm [3] moves the stacker entrance driven roller up and down.
- The roller pressure motor (M27) [5] turns ON after specified period of time since the FNS entrance sensor (PS1) detects the leading edge of the paper and turns ON. Then the pressure of the stacker entrance roller is released.
- The cam [6] is equipped with the actuator [4]. The roller pressure motor home sensor (PS34) [7] controls the rotation position.

[1]	Stacker entrance roller	[2]	Stacker entrance driven roller
[3]	Arm	[4]	Actuator
[5]	Roller pressure motor (M27)	[6]	Cam
[7]	Roller pressure motor home sensor (PS34)	-	

5.3.3 Stack assist control

(1) During the overlap conveyance

- During the overlap conveyance, the stack assist plate [6] is set at the position lower than the stacker entrance roller [1]. It prevents the tip of paper [7] that is switched back from dropping in the stacker [2].
- The position of the stack assist plate is changed according to the shape of the cam [3].
- The stack assist motor (M8) drives the cam.
- The cam is equipped with the actuator [5]. The stacker assist home sensor (PS11) [4] controls the rotation position.

[1]	Stacker entrance roller	[2]	Stacker
[3]	Cam	[4]	Stacker assist home sensor (PS11)
[5]	Actuator	[6]	Stack assist plate
[7]	Overlapped paper	-	

(2) During stacking

- During stacking, the stack assist plate [6] leads the paper [1] ejected from the stacker entrance roller [2] into the stacker [3].
- The stack assist plate presses the paper while the cam [7] rotates once.

[1]	Stack paper	[2]	Stacker entrance roller
[3]	Stacker	[4]	Stacker assist home sensor (PS11)
[5]	Actuator	[6]	Stack assist plate
[7]	Cam	-	

5.3.4 Paper stopper control

- The rewind paddle [2] is equipped for striking the paper [4] conveyed from the stacker entrance roller [6] against the rear stopper [3] of the stacker [5].
- The stacker entrance motor (M5) that is transmitted via the stacker entrance roller drives the rewind paddle.
- The rewind paddle is equipped with a pressure release mechanism [1] against paper.
- The rewind release motor (M28) drives the pressure release of the rewind paddle.
- The pressure release drive shaft of the rewind paddle is equipped with the actuator. The rewind paddle release home sensor (PS38) controls the pressing position.
- The pressing distance of the rewind paddle is changed according to the number of sheets loaded in the stacker.

[1]	Pressure release	[2]	Rewind paddle
[3]	Rear stopper	[4]	Paper
[5]	Stacker	[6]	Stacker entrance roller

5.3.5 Rear stopper position control

- It is equipped with the rear stopper to align the trailing edge of paper stacked in the stacker.
- There are 3 types of rear stoppers; rear stoppers /Fr [3], /Md [2], and /Rr [1]. They are positioned on the center and both ends in the cross direction.
- The 3 stoppers keep the rear edge of the stacked paper to prevent the deformation as a paper bundle and improve the quality after the stapling.
- The rear stoppers /Fr and /Rr are connected to the timing belt [4]. The drive of the stacker movement motor (M19) [5] moves them.
- The rear stoppers /Fr and /Rr move to the symmetry direction based on the center of the rear stopper /Md.
- The shift amount of the rear stoppers /Fr and /Rr varies depending on the paper size and the print mode. However, they always keep the edge of paper.
- In the staple mode, when the stop positions of the rear stoppers /Fr and /Rr conflict with the stapling position, the position is moved right before the stapling.
- The rear stopper /Md does not move in the cross direction. But it assists the paper ejection.

[1]	Rear stopper /Rr	[2]	Rear stopper /Md
[3]	Rear stopper /Fr	[4]	Timing belt
[5]	Stacker movement motor (M19)	-	

5.3.6 Paper pressure control

- It is equipped with the rear pressers /Fr [7] and /Rr [3] to press the trailing edge of paper stacked in the stacker.
- The rear presser corrects the paper curl to prevent the paper misalignment at stapling.
- The rear presser suppresses the air layer between sheets and keeps the paper load capacity.
- The drive of the stacker paper press motor (M21) that is transmitted via the pressure lever [2] drives the rear pressers /Fr and /Rr.
- The rear pressers /Fr and /Rr are equipped with the spring, and the pressure volume is changed according to the paper thickness.
- The pressure lever is equipped with the actuator [5]. The exit paper press home sensor (PS37) [6] controls the pressing position.

- The rear pressers /Fr and /Rr are positioned at the rear stoppers /Fr and /Rr. They are driven according to the movement of the rear stoppers /Fr and /Rr.

[1]	Stacker paper press motor (M21)	[2]	Pressure lever
[3]	Rear presser /Rr	[4]	Drive shaft
[5]	Actuator	[6]	Stacker paper press home sensor (PS30)
[7]	Rear presser /Fr	[8]	Paper

5.3.7 Horizontal alignment control

(1) Horizontal alignment mechanism

- The CD alignment plates /Fr [3] and /Rr [5] align the paper in the cross direction.
- The CD alignment plates /Fr and /Rr are connected to the timing belt [4]. The drive of the stacker alignment motor (M9) [1] moves them.
- The CD alignment plate has a projection on the top. The projection is used as a guide for the overlap conveyance.
- The CD alignment plate is equipped with the actuator. The stacker alignment home sensor (PS12) [6] controls the movement position of the CD alignment plate /Fr, /Rr.

[1]	Stacker alignment motor (M9)	[2]	Stacker empty sensor (PS28)
[3]	CD alignment plate /Fr	[4]	Timing belt
[5]	CD alignment plate /Rr	[6]	Stacker alignment home sensor (PS12)

(2) Alignment timing

- The alignment is basically executed once for each sheet or bundle.
- When all of the following conditions are met, the alignment is executed twice for each sheet or bundle.
 - When the 1-position stapling is executed for 2 sheets or more
 - When the 2-position stapling is executed for 5 sheets or more
 - When the paper length in the feed direction is 231mm or longer
 - When the FNS entrance sensor (PS1) is OFF at finishing the alignment initial operation

(3) Paper in the stacker detection control

- The stack side of the stacker is equipped with the stacker empty sensor (PS28). It detects whether paper remains in the stacker or not.

5.3.8 Vertical alignment control

(1) Vertical alignment mechanism

- For the paper whose length in the feed direction is 230mm or shorter, the alignment is executed with the FD alignment plate [9] pushing the paper against the rear stoppers /Fr [4], /Md [3], and /Rr [2].
- The small size paper alignment motor (M18) [1] drives the FD alignment plate.
- The drive section of the FD alignment board is equipped with the actuator [7]. The small size paper alignment home sensor (PS26) [8] and the stacker rear alignment sensor (PS44) [6] control the drive position.

[1]	Small size paper alignment motor (M18)	[2]	Rear stopper /Rr
[3]	Rear stopper /Md	[4]	Rear stopper /Fr
[5]	Stacker empty sensor (PS28)	[6]	Stacker rear alignment sensor (PS44)
[7]	Actuator	[8]	Small size paper alignment home sensor (PS26)
[9]	FD alignment plate	-	

(2) Alignment timing

- The alignment operation starts after a specified period of time since the paper overlap sensor /1 (PS32) detects the trailing edge of paper.
- The duration of time after PS32 turns OFF and before the small size paper alignment motor (M18) that drives the FD alignment board turns ON varies depending on the paper size and the stop position of the FD alignment board.
- In the alignment operation, the reverse rotation of M18 presses paper. Then, it rotates forward after a pause to move to the standby position.

(3) Air assist control

- For the paper whose length in the feed direction is 231mm or more, the alignment is executed only with the air assist [3] from the large size paper alignment fan (FM1) [1].
- Air layer is created between the sheets to which air is blown. By reducing the resistance between the sheets, it helps the paper fall with its own weight.

[1]	Large size paper alignment fan (FM1)	[2]	Paper
[3]	Air assist		-

5.3.9 Small-size paper exit auxiliary control

- The FD alignment plate [2] ejects the stapled bundle of paper, but the trailing edge of the bundle of paper is lower than the movable range of the FD alignment plate. Therefore, the paper cannot be conveyed at this position.
- It lifts the rear stopper /Md [1] and raises the trailing edge of the bundle of paper to the movable range of the FD alignment plate.
- The stacker rear stopper motor (M20) [3] drives the rear stopper /Md.
- The stacker rear stopper home sensor (PS29) controls the drive position of the rear stopper /Md.

[1]	Rear stopper /Md	[2]	FD alignment plate
[3]	Stacker rear stopper motor (M20)	[4]	Stacker rear stopper home sensor (PS29)

6. STAPLER SECTION

6.1 Configuration

[1]	Stapler movement motor (M14)	[2]	Stapler
[3]	Staple scraps box	-	

6.2 Drive

6.2.1 Stapler movement/rotation control

[1]	Stapler movement motor (M14)	[2]	Stapler movable base
[3]	Guide	[4]	Stapler position shaft
[5]	Rotation fulcrum shaft	-	

6.3 Operation

6.3.1 Stapler movement control

(1) Stapler movement mechanism

- There are 2 types for the stapler movement; parallel and rotational.
- The stapler movement motor (M14) operates the parallel and rotational movements.
- The stapler fixed base is equipped with the rotation fulcrum shaft and the position control shaft. Once these shafts move parallel and pass the guide, it rotates along the groove of the guide.
- One stapler staples at 2 positions.
- The stapler movement home sensor (PS22) and the staple center position sensor (PS6) control the stapler movement position.

(2) Staple 1-position control

- When the print start signal is turned ON, the stapler movement motor (M14) also turns ON to move the stapler to the position according to the paper size.
- Once the stapling finishes, the stapler remains at the position.

(3) Staple 2-position control

- When the print start signal is turned ON, the stapler movement motor (M14) also turns ON to move the stapler to the 1st stapling position according to the paper size.
- Once the 1st stapling finishes, the stapler moves parallel to the 2nd stapling position.

- Once the 2nd stapling finishes, the stapler remains at the position until the subsequent bundle of paper is reached.
- When the subsequent bundle of paper is reached, the 1st stapling is executed.
- Once the 1st stapling finishes, the stapler moves parallel to the 2nd stapling position.
- The operations are repeated.

6.3.2 Staple control

(1) Staple operation

- Stapler is integral structure, and it has the stapler section [2] and the clincher section [1].
- Stapler motor (M31) drives the clincher section and then press the paper [3].
- M31 pushes out the staple from the cartridge of the stapler section.
- The staple which has passed through the pressed paper is cut its overhang which is over a certain length.
- The staple which has been cut is folded its edge by hitting the clincher section to staple the paper together.

[1]	Clincher section	[2]	Stapler section
[3]	Paper	-	

(2) Staple control

- After the CD alignment plate /Fr, Rr and the FD alignment plate finish the alignment of the paper, the stapler motor (M31) turns ON and drive the clincher section of the stapler to press the paper.
- M31 continues to turn ON after it driven the clincher. M31 pushes out the staple from the cartridge, and cut the overhang of the staple.
- After M31 finishes pushing the staple and stapling the paper, it releases the pressure toward the paper by the clincher section.
- The stapler home sensor (PS40) controls the rotation position of M31.
- When PS40 turns OFF after M31 turns ON, M31 turns OFF after a specified period of time. M31 executes pressing the paper with the clincher section, pushing out and cutting the staple and releasing the press with the clincher section in a series of operations by it turns OFF.

(3) Clogged staple detection

- When the stapler home sensor (PS40) does not turn OFF within a specified period of time after the stapler motor (M31) turns ON, the stapler home sensor (PS40) judges that the staples have been clogged and turns M31 OFF.

(4) Cartridge detection

- The cartridge set sensor (PS42) detect the presence of a cartridge or the incorrect setting of a cartridge.
- When there is no cartridge or the cartridge is set incorrectly, an error message is displayed on the operation section.

(5) Staple detection

- When the staples run short, the staple empty sensor (PS41) detect this condition and display an error message on the operation section.

(6) Staple scraps box detection

- The stapler scraps box set sensor (PS35) detects the presence of a staple scraps box or the incorrect setting of a box.
- When there is no staple scraps box or it is set incorrectly, an error message is displayed on the operation section.

(7) Staple scraps box detection

- The staple scraps box full sensor (PS7) detects the rest of the capacity of the staple scraps box.
- The error message is displayed on the operation panel, when the staple scraps box full is detected.

7. MAIN TRAY SECTION

7.1 Configuration

[1]	Paper exit opening	[2]	Paper exit alignment plate
[3]	Up/down belt	[4]	Gripper /Lw
[5]	Paper exit roller /Lw	[6]	Main tray
[7]	Gripper /Up	-	

7.2 Drive

7.2.1 Main tray up-down drive

[3]	Paper holding arm	[4]	Exit paper press motor (M26)
[5]	Gripper exit motor /Lw (M17)	[6]	Link arm swing material
[7]	Link arm	[8]	Gripper /Up
[9]	Gripper exit motor /Up (M16)	[10]	Main tray paper exit sensor (PS10)

7.2.4 Paper exit alignment plate drive

[1]	Paper exit alignment plate motor (M12)	[2]	Paper exit alignment plate
[3]	Paper exit alignment plate up down motor (M13)	-	

7.2.5 Main tray shift drive

[1]	Back board (main tray connecting section)	[2]	Pulley
[3]	Tray shift roller motor (M15)	[4]	

7.3 Operation

7.3.1 Paper exit opening control

- The paper exit opening motor (M10) [9] drives the paper exit opening [7] via the arm [4] and the pulley [3].
- The arm is connected to the offset position from the center of the pulley. It opens and closes the paper exit opening while the pulley rotates once.
- The pulley is equipped with the actuator [1], and the paper exit opening sensor (PS13) [2] controls the rotation position.
- The home position [6] is where the paper exit opening is closed.
- The release position [8] is where the paper exit opening opens about 50 degrees.

[1]	Actuator	[2]	Paper exit opening sensor (PS13)
[3]	Pulley	[4]	Arm
[5]	Paper exit roller	[6]	Home position
[7]	Paper exit opening	[8]	Release position
[9]	Paper exit opening motor (M10)	-	

7.3.2 Gripper control

(1) Gripper mechanism

- The gripper is equipped for preventing the misalignment of paper on the main tray by stabilizing the time duration of paper dropping from the exit roller to the main tray.
- The grippers /Up [6] and /Lw [2] nip the top and bottom of the ejected paper [1]. The paper is struck against the paper exit stopper plate [4] and is pulled in.
- The paddle [3] is equipped on the bottom of the tip of the gripper /Lw. It returns the paper on the top that has been ejected to the paper exit stopper plate.
- The gripper exit motor /Up (M16) drives the gripper /Up.
- The gripper home sensor /Up (PS24) is equipped on the M16 drive path. It controls the operation condition of the gripper /Up.
- The gripper exit motor /Lw (M17) drives the gripper /Lw.
- The gripper home sensor /Lw (PS25) is equipped on the M17 drive path. It controls the operation condition of the gripper /Lw.

[1]	Paper	[2]	Gripper /Lw
[3]	Paddle	[4]	Paper exit stopper plate
[5]	Exit roller	[6]	Gripper /Up

(2) Operation timing

- After a specified period of time since the FNS entrance sensor (PS1) detects the paper trailing edge and turns OFF, the gripper exit motor /Up (M16) rotates forward and the gripper exit motor /Lw (M17) turns ON.
- The grippers /Up and /Lw grip the paper [1], and the paper is ejected on the main tray.
- When the grip of paper is released, M16 switches the rotation from forward to reverse. Then, M16 turns OFF and turns in a standby condition when the gripper home sensor /Up (PS24) turns ON.
- M17 turns OFF after a specified period of time since the gripper home sensor /Lw (PS25) turns OFF, and turns in a standby condition.
- These operations are repeated for each paper.

[1]	1st sheet grip	[2]	2nd sheet grip
-----	----------------	-----	----------------

7.3.3 Paper pressure control

- The holding material [1] is equipped for preventing the curling of the paper [2] that has been ejected on the main tray and the pushing out by the subsequent pages.
- The exit paper press motor (M26) drives the holding material.
- The actuator is equipped on the drive path from M26 to the holding material. The exit paper press home sensor (PS37) controls the operation condition.
- When a print job is received, M26 turns ON and the holding material is pressed against the paper.
- When FNS entrance sensor (PS1) detects the trailing edge of the 1st sheet of paper, M26 turns OFF after a specified period of time.
- The pressure of the holding material is released once. But it returns to the pressure status after a specified period of time.
- These operations are repeated for each conveyed paper.

[1]	Holding material	[2]	Paper
[3]	Exit roller	-	

7.3.4 Main tray up/down control

(1) Up/down mechanism

- The forward or reverse rotation of the main tray up down motor (M11) drives the up/down belt to move the main tray up or down.
- The main tray upper limit sensor (PS14) and the tray upper limit LED (LED1) detect the top surface of paper on the main tray.

(2) Tray full-status detection alarm control

- When the operation panel section is informed the tray full-status detection alarm for the main tray, the main tray upper limit sensor (PS14) and the main tray near empty sensor (PS46) turns ON after the paper on the main tray is removed. Then, the tray full-status detection alarm is released.
- When the PS46 turns OFF, the tray full-status detection alarm is not released even PS14 turns ON.

(3) Main tray loading volume detection control

- The maximum stacking capacity of paper on the main tray varies depending on the paper size and whether the SD is installed or not.
- When the SD is not installed, the maximum capacity of the main tray is where the 4000 sheets sensor (PS19) [1] turns ON.
- When the SD is installed, the maximum capacity of the main tray is where the 3000 sheets sensor (PS16) [2] turns ON.

- When the size of loaded paper is large size, the maximum capacity of the main tray is where the main tray middle position sensor (PS18) [3] turns ON.
- When the size of loaded paper is small size, the maximum capacity of the main tray is where the main tray quarter position sensor (PS17) [4] turns ON.

[1]	4000 sheets sensor (PS19)	[2]	3000 sheets sensor (PS16)
[3]	Main tray middle position sensor (PS18)	[4]	Main tray quarter position sensor (PS17)
[5]	Main tray near empty sensor (PS46)	[6]	Main tray upper limit sensor (PS14)

(4) Paper extraction detection control

- The paper removal sensor (PS15) detects paper that is loaded on the main tray.
- PS15 detects the presence or absence of paper with the actuator.
- When paper is loaded on the main tray, the actuator is pushed and PS15 turns OFF.
- When paper is removed from the main tray, the actuator is tilted to the main tray side and PS15 turns ON.

[1]	Loaded paper	[2]	Paper removal sensor (PS15) OFF
[3]	Paper removal sensor (PS15) ON	[4]	Actuator

(5) Paper exit switch

- When the paper exit switch (SW1) is pushed for 0.5 second or more while paper is ejected to the main tray in the straight mode or the shift mode, the ejection is temporary stopped.
- Press the start button on the main body or the paper exit switch (SW1) to restart the ejection.

(6) Main tray output detection

- The main tray paper exit sensor (PS10) detects the main tray output.

7.3.5 Paper exit alignment control

(1) Paper exit alignment mechanism

- The paper exit alignment plates /Fr [1] and /Rr [3] are equipped for aligning the paper that is ejected on the main tray.

- The paper exit alignment plates /Fr and /Rr are connected to the timing belt [10]. The drive of the paper exit alignment plate motor (M12) [11] moves them.
- The paper exit alignment plates /Fr and /Rr move symmetrically based on the center of the paper exit opening.
- The support section [9] of the paper exit alignment plate /Rr is equipped with the actuator. The paper exit alignment plate home sensor (PS20) [8] controls the alignment position.
- Since the main tray shifts, the paper exit alignment plates /Fr and /Rr are lifted and removed from paper when the shift position is switched.
- The paper exit alignment plate up down motor (M13) [7] lifts the paper exit alignment plates /Fr and /Rr.
- The actuator [4] is equipped on the pulley [5] that transmits the drive of M13. The paper exit alignment plate up down home sensor (PS21) [6] controls the shift position of the paper exit alignment plates /Fr and /Rr.
- The movable alignment plate [2] is equipped on each paper exit alignment plate. It prevents the shock that is given to the tray or paper.

[1] Paper exit alignment plate /Fr	[2] Paper exit alignment plate
[3] Paper exit alignment plate /Rr	[4] Actuator
[5] Pulley	[6] Paper exit alignment plate up down home sensor (PS21)
[7] Paper exit alignment plate up down motor (M13)	[8] Paper exit alignment plate home sensor (PS20)
[9] Support section	[10] Timing belt
[11] Paper exit alignment plate motor (M12)	-

(2) Operation timing

- The paper exit alignment plate motor (M12) turns forward and reverse after a specified period of time since the FNS entrance sensor (PS1) detects the trailing edge of paper. Then, the paper exit alignment plate motor drives the paper exit alignment plates /Fr and /Rr.
- The paper exit alignment plates /Fr and /Rr align each sheet of paper that has been sent.
- The paper exit alignment plate up down motor (M13) turns reverse when the tray shift roller motor (M15) turns ON, and lifts the paper exit alignment plates /Fr and /Rr.
- The main tray is shifted during the operation.
- When the shift of the main tray finishes, M13 turns toward after a specified period of time since PS1 turns OFF. It lowers the paper exit alignment plates /Fr and /Rr.
- M13 executes those operations for each last sheet.

7.3.6 Main tray shift control

(1) Main tray shift mechanism

- The paper eject position of the alignment mechanism for ejected paper is fixed based on the center. Therefore, the shift mechanism that sorts paper into each set is provided on the main tray side.
- The drive unit of the shift mechanism is equipped inside the FNS. The moving part of the main tray [1] is connected to the back board [11] in the drive unit.
- Both of the back board in the drive unit and the moving part of the main tray consist of the roller and the bearing.
- The tray shift roller motor (M15) [2] drives the back board in the drive unit via the arm [8] and the pulley [7].
- The arm is connected to the offset position from the center of the pulley. It shifts the back board while the pulley rotates a half turn.
- The cam is equipped with the actuator [9]. The main tray home sensor (PS23) [6] controls the rotation position.

[1]	Main tray	[2]	Tray shift roller motor (M15)
[3]	Bearing	[4]	Bearing
[5]	Roller	[6]	Main tray home sensor (PS23)
[7]	Pulley	[8]	Arm
[9]	Actuator	[10]	Roller
[11]	Back board	[12]	Bearing
[13]	Bearing	[14]	Roller

(2) Main tray shift timing

- The tray shift roller motor (M15) turns ON after a specified period of time since the FNS entrance sensor (PS1) detects the trailing edge of last sheet in the set. It shifts the main tray.
- The main tray home sensor (PS23) turns OFF when M15 turns ON. When PS23 turns ON again and detects the home position, M15 turns OFF and turns in the standby condition.
- According to this operation, the first sheet of the subsequent set is ejected on the shifted position.
- The same operations are repeated when PS1 detects the trailing edge of the last sheet of the subsequent set.

3.3 Operation

3.3.1 SD entrance conveyance

- The SD conveyance roller and the SD stacker entrance roller convey paper that is conveyed from the SD conveyance path of the FNS into the SD.
- The SD entrance motor (M101) drives the SD conveyance roller and the SD stacker entrance roller.
- The SD entrance sensor (PS102) is equipped on just before the SD stacker entrance roller.
- PS102 triggers the operations of M101, the saddle stitching alignment motor (M104), the center paddle motor (M106), and the lower paddle motor (M109).
- PS102 detects the paper which remains in the entrance conveyance section.

-----	---	-----	-----------------

4.3 Operation

4.3.1 Paper stopper control mechanism

- The paper [13] conveyed from the SD stacker entrance roller [4] is conveyed to the alignment part /Up [12]. Then, the paddles /Md [1] and /Lw [6] align the paper to the rear stopper [10] of the alignment part /Lw [11].
- The center paddle motor (M106) drives the paddle /Md. The lower paddle motor (M109) drives the paddle /Lw.
- The paddles /Md and /Lw are installed at the specified position on the circle of the drive shaft.
- When paper is conveyed to the alignment section or to the half-folding section after the alignment, the paddles /Md and /Lw move to the position where they do not block the conveyance path.
- The actuators [3] and [7] are equipped on the drive shaft of each paddle. The center paddle home sensor (PS108) [2] and the lower paddle home sensor (PS114) [8] control the rotation position.
- The stacker empty sensor /Up (PS101) [14] and the stacker empty sensor /Lw (PS115) [9] are equipped on the alignment parts /Up and /Lw. They detect the remained sheet.

[1]	Paddle /Md	[2]	Center paddle home sensor (PS108)

[11]	Alignment part /Lw	[12]	Alignment part /Up
[13]	Paper	[14]	Stacker empty sensor /Up (PS101)

4.3.2 Rear stopper mechanism

- The rear stopper [8] is equipped for aligning the rear edge of paper [7] stacked on the alignment section.
- The stopper motor (M105) [3] drives the rear stopper via the timing belt [5].
- The actuator [2] is equipped on the rear stopper. The stopper home sensor (PS107) [4] controls the stop position.
- The rear gripper [1] is equipped for preventing the misalignment of the stacked paper that is caused when the rear stopper moves.
- The rear gripper solenoid (SD102) [6] drives the rear gripper.
- Once SD102 turns ON, the rear gripper goes down to press paper against the rear stopper and keep the paper.

[1]	Rear gripper	[2]	Actuator

[5]	Stopper motor (M105)	[6]	Rear gripper solenoid (SD102)
[7]	Paper	[8]	Rear stopper

4.3.3 Alignment mechanism

- The alignment plates /Fr [4] and /Rr [3] align paper that is stacked on the alignment section in the cross direction.
- The alignment plates /Fr and /Rr are connected to the timing belt [5], and the drive of the saddle stitching alignment motor (M104) [1] moves them.
- The alignment plates /Fr and /Rr move to the symmetry direction based on the center of paper.
- The Alignment Plate /Rr is equipped with the actuator. The alignment home sensor (PS106) [2] controls the movement amount of the Alignment Plate /Fr and /Rr.

[1]	Saddle stitching alignment motor (M104)	[2]	Alignment home sensor (PS106)
[3]	Alignment plate /Rr	[4]	Alignment plate /Fr
[5]	Timing belt	[6]	Actuator

4.3.4 Alignment control

(1) Initial operation at starting the print job

- When the print start signal turns ON, the sensors which are equipped on each conveyance path detect the presence of paper.
- When any of the sensor other than the stacker empty sensor /Lw (PS115) detects paper, a message to release the JAM is displayed on the control panel of the main body while the FNS is stopped.
- When PS115 detects paper, the initial operation of the stopper motor (M105) is performed to check whether PS115 switches from ON to OFF. When PS115 continues to turn ON, the FNS is stopped and a message to release the JAM is displayed on the control panel of the main body.
- When any of the sensor does not detect paper, turn ON the SD entrance motor (M101), the folding roller motor (M108) and the saddle stitching exit motor (M120). Then check whether any of the sensor does not detect paper again.
- When any of the sensor detects paper, the FNS is stopped and a message to release the JAM is displayed on the control panel of the main body.
- When any of the sensor does not detect paper, the initial operation of each load is performed.
- The initial operation of each load is a home position search operation of each load.
- The home position search operation varies depending on the stop position of each load.

(2) Standby position movement

- After the initial operation, the saddle stitching alignment motor (M104) and the stopper motor (M105) move to the standby position from each home position.
- The standby position varies depending on the paper size.

(3) Initial operation during continuous printing

- During the continuous printing, when the subsequent print is in the same print mode but the paper size differs or when the subsequent print is in the different print mode, the saddle stitching alignment motor (M104) and the stopper motor (M105) perform the initial operation.
- In the initial operations of M104 and M105, the home position is searched once. Then, it moves to the standby position according to the subsequent print.

(4) Alignment control of saddle stitching mode

- After a specified time since the SD entrance sensor (PS102) detects the trailing edge [1] of the 1st paper, the SD entrance motor (M101) switches the rotation speed from high speed to low speed [2].
- After a specified time since PS102 detects the trailing edge of the 1st paper, the lower paddle motor (M109) rotates [3] the paddle /Lw. This operation is the preparation to contact paper to the rear stopper.
- After the paper conveyance to the alignment part /Up is completed, the center paddle motor (M106) rotates [4] the paddle /Md.
- After a specified period of time since the center paddle home sensor (PS108) detects the second ON [5], M106 turns OFF to finish the paper alignment operation by the paddle /Md.
- The alignment plates /Fr and /Rr wait at the position that has been specified according to the paper size.
- After a specified period of time since PS102 detects the trailing edge of the 1st paper, the saddle stitching alignment motor (M104) rotates forward [6] and closes the alignment plates /Fr and /Rr to align paper.
- After a specified time since M109 turns ON and the lower paddle home sensor (PS114) detects the fourth ON [7], M109 turns OFF to finish the paper alignment operation of the paddle /Lw.
- After a specified time since M104 finishes the alignment, it reverses [8] to return to the standby position.
- M101 switches the rotation speed from low to high speed [9] after a specified period of time has passed. The timing when the rotation speed is switches differs depending on the paper size.
- When PS102 detects the trailing edge of the 2nd paper, M101 switches the rotation speed from high to low speed.
- M106, M109, and M104 perform the paper alignment operation to the 2nd paper that is the same as to the 1st paper. However, M106 turns OFF after a specified time since M106 turns ON and PS108 detects the third ON [12].
- For the 3rd and the subsequent sheets, the process that is the same as the 2nd sheet is performed.

- When PS102 detects the trailing edge of the last paper and turns OFF, M104 performs the alignment operation twice.
- After a specified period of time since M104 performs the second alignment operation and returns to the standby position, the rear gripper solenoid (SD102) turns ON [13] to grip the bundle of paper.
- The stopper motor (M105) rotates forward [14] and move the bundle of paper to the staple position.
- During the stapling, M104 rotates forward [15] to close the alignment plates /Fr and /Rr.
- When the stapling finishes, M104 reverses [16] to move the alignment plates /Fr and /Rr to the standby position.
- After a specified period of time since the Alignment Plate /Fr, /Rr move to the standby position, SD102 turns ON again [17] to grip the bundle of paper.
- M105 rotates in the reverse direction [18] and move the bundle of paper which is performed Fold & Staple to the Half position.
- When a series of operations finishes, M104 and M105 perform the initial operation.

[1]	Trailing edge of the 1st saddle stitching sheet detected	[2]	Paper conveyance section low speed conveyance
[3]	Paddle /Lw drive	[4]	Paddle /Md drive
[5]	Paddle /Md home position detected (second)	[6]	Alignment of 1st saddle stitching sheet
[7]	Paddle /Lw home position detected (fourth)	[8]	Moved to the alignment plates /Fr and /Rr standby positions
[9]	Paper conveyance section high speed conveyance	[10]	Trailing edge of the 2nd or last saddle stitching sheet detected
[11]	Paper conveyance section low speed conveyance	[12]	Paddle /Md home position detected (third)
[13]	Rear gripped for moving the stapling position	[14]	Moved to the rear stopper stapling position
[15]	Alignment for stapling	[16]	Alignment for stapling released
[17]	Rear gripped for moving the half-folding position	[18]	Moved to the rear stopper half-folding position

(5) Alignment control of half-folding/tri-folding mode

- The processes of the half-folding and the tri-folding before the last sheet are the same as the process of the saddle stitching mode.
- When the SD entrance sensor (PS102) detects the trailing edge of the last folding paper and turns OFF, the saddle stitching alignment motor (M104) performs the alignment once. Then, it keeps the alignment plates /Fr and /Rr at the alignment position [1].
- After a specified period of time since the Alignment Plate /Fr, /Rr move to the alignment position, M104 rotates in the reverse direction [2] to move them to the standby position.
- After a specified period of time since the Alignment Plate /Fr, /Rr move to the standby position, the rear gripper solenoid (SD102) turns ON [3] to grip the bundle of paper.
- The stopper motor (M105) reverses [4] to move the aligned bundle of paper to the half-folding position or the 1st folding position of the tri-folding.
- When a series of operations finishes, M104 and M105 perform the initial operation.

[1]	Alignment	[2]	Alignment released
[3]	Rear gripped for moving the folding position	[4]	Moved to the rear stopper folding position

5. STAPLER SECTION

5.1 Configuration

[1]	Clincher	[2]	Stapler
[3]	Stapler movement motor (M103)	[4]	Stapler shift home sensor (PS105)

5.2 Drive

[1]	Clincher	[2]	Stapler
[3]	Stapler movement motor (M103)	-	

5.3 Operation

5.3.1 Stapler movement control

(1) Stapler movement mechanism

- The stapler [3] and the clincher [2] are divided. The dedicated stapler guides [4] hold each of them.
- The stapler is fixed on the timing belt [6] and the stapler movement motor (M103) [5] drives it.
- Since the clincher is connected with the stapler by the connecting bracket [1], it moves together with the stapler.
- The actuator [7] is equipped with the stapler. The stapler shift home sensor (PS105) [8] controls the movement position.

[1]	Connecting bracket	[2]	Clincher
[3]	Stapler	[4]	Stapler guide
[5]	Stapler movement motor (M103)	[6]	Timing belt
[7]	Actuator	[8]	Stapler shift home sensor (PS105)

(2) Standby position movement

- After the initial operation, the stapler movement motor (M103) that drives the stapler moves from each home position to the standby position.

- The standby position varies depending on the paper size.
- (3) Initial operation during continuous printing**
- During the continuous printing or when the subsequent print is in the Fold & Staple mode, the stapler movement motor (M103) performs the initial operation.
 - Otherwise, M103 does not perform the initial operation.
 - In the initial operation of M103, the home position is searched once. Then, it moves to the standby position according to the subsequent print.
- (4) Staple 2-position control**
- When the saddle stitching alignment motor (M104) completes [1] the alignment, the stapler movement motor (M103) rotates in the reverse direction [2].
 - Move the stapler to the 1st staple position.
 - After a specified period of time since the movement completes, the SD stapler motor (M102) turns ON [3] and performs the 1st stapling.
 - After a specified period of time since the 1st stapling is completed, M103 rotates in the forward direction.
 - Move the stapler to the 2nd staple position.
 - After a specified period of time since the movement completes, M102 turns ON [3] and performs the 2nd stapling.
 - When the 2nd stapling completes, M104 rotates in the reverse direction [6] and releases the alignment.

5.3.2 Staple control

(1) Staple operation

- The stapler section [3] and the clincher section [1] is separated in the structure of the stapler.
- The SD stapler motor (M102) lift up the cartridge [2], and press the paper against the clincher section.
- M102 pushes out the staple from the cartridge.
- The staple which has passed through the pressed paper is folded its edge by hitting the clincher section. Thus the paper is stapled together.

[1]	Clincher section	[2]	Cartridge
[3]	Stapler section	[4]	Paper

(2) Staple control

- After the Alignment Plate /Fr, /Rr finish the alignment of the paper, the SD stapler motor (M102) turns ON and lift up the cartridge of the stapler section to press the paper against the clincher section.
- M102 pushes out the staple after it finishes pressing the paper.
- After M102 finishes pushing the staple and stapling the paper, it moves back the cartridge to the original position and releases the pressure toward the paper.
- The stapler home sensor (PS103) controls the rotation position of M102.
- When PS103 turns OFF after M102 turns ON, M102 turns OFF after a specified period of time. M102 executes lifting up the cartridge, pushing out the staple and moving back the cartridge in a series of operation by it turns OFF.

(3) Clogged staple detection

- When the stapler home sensor (PS103) does not turn OFF within a specified period of time after the SD stapler motor (M102) turns ON, PS103 judges that the staples have been clogged and turns M102 OFF.

(4) Staple and cartridge detection

- When the staples run short, the staple empty sensor (PS104) detect this condition and display an error message on the operation section.
- PS104 detects the presence of a cartridge or the incorrect setting of a cartridge.

[1] 2nd folding gate solenoid (SD101)	[2] 2nd folding gate
---------------------------------------	----------------------

6.3 Operation

6.3.1 1st Fold knife control

(1) 1st folding knife mechanism

- The 1st folding knife motor (M107) drives the 1st folding knife.
- The drive gear of the 1st folding knife is equipped with the actuator. The 1st folding knife home sensor (PS110) controls the movement amount of the 1st folding knife.
- The 1st folding knife is used in the half-folding, saddle stitching, and tri-folding modes.
- In the tri-folding mode, it is used for the 1st folding.

(2) 1st folding knife operation

- The 1st folding knife [2] pushes paper [3] stacked on the alignment section to the position where the 1st folding roller [5] nips the paper.
- The 1st folding roller pulls in the paper and presses and folds it between the rollers.
- The folding position is controlled depending on the stop position of the rear stopper [4].

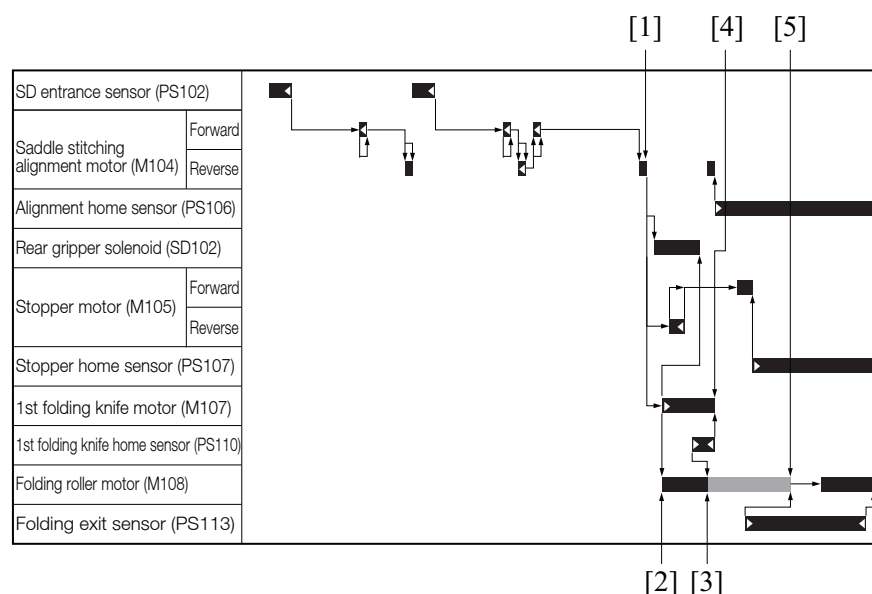

[1] 1st folding knife home sensor (PS110)	[2] 1st folding knife
[3] Paper	[4] Rear stopper
[5] 1st folding roller	-

(3) 1st folding knife control

- The 1st folding knife motor (M107) turns ON after a specified period of time since the saddle stitching alignment motor (M104) completes the alignment of the last paper.
- When M107 turns ON, the 1st folding knife comes out and pushes paper against the 1st folding roller.
- When the 1st folding knife home sensor (PS110) turns ON, M107 turns OFF after a specified period of time.

6.3.2 Half-folding/saddle stitching conveyance control

- When the saddle stitching alignment motor (M104) completes [1] the alignment of the last sheet, the 1st folding knife motor (M107) and the folding roller motor (M108) turn ON [2] after a specified period of time.
- When M107 turns ON, the 1st folding knife starts pushing the paper.
- When the 1st folding knife home sensor (PS110) turns ON, M108 switches the conveyance speed from low speed to high speed [3].
- When PS110 turns OFF [4], M107 completes the 1st folding operation.
- When the folding exit sensor (PS113) detects the leading edge of ejected paper, M108 turns OFF [5] after a specified period of time.

[1]	Alignment released	[2]	1st folding operation started
[3]	Speed up the conveyance speed	[4]	1st folding operation completed
[5]	High speed conveyance completed	-	

6.3.3 2nd folding gate control

(1) 2nd folding gate mechanism

- To switch the conveyance path for the half-folding, saddle stitching and the tri-folding, the 2nd folding gate is equipped.
- The 2nd folding gate solenoid (SD101) [6] drives the 2nd folding gate.
- SD101 turns OFF while in the Half or the Fold & Staple mode.
The 1st folded paper is conveyed to the SD exit roller [4] through the space under the 2nd folding gate.
- In the tri-folding mode, SD101 turns ON and closes the 2nd folding gate [3].
The 1st folded paper is conveyed to the upper side of the 2nd folding gate. Then the 2nd folding knife [9] executes the tri-folding.
- The 2nd folding sensor (PS112) [8] is equipped for judging the tri-folding position accurately.
- The 2nd folding knife home sensor (PS111) [7] controls the position where the 2nd folding knife pushes in.

[1]	1st folding roller	[2]	2nd folding roller
[3]	2nd folding gate (in the tri-folding mode)	[4]	SD exit roller
[5]	2nd folding gate (in the half-folding or saddle stitching mode)	[6]	2nd folding gate solenoid (SD101)
[7]	2nd folding knife home sensor (PS111)	[8]	2nd folding sensor (PS112)
[9]	2nd folding knife	-	

(2) 2nd folding gate control

- The 2nd folding gate solenoid (SD101) turns ON at the same time when the saddle stitching alignment motor (M104) turns ON for the last sheet.
- SD101 turns OFF when the folding exit sensor (PS113) detects the trailing edge of the bundle of paper.

6.3.4 2nd Folding knife control

(1) 2nd folding knife mechanism

- The 2nd folding knife operates by the 2nd folding knife motor (M110).
- The actuator [2] is equipped on the 2nd knife, and the 2nd folding knife home sensor (PS111) controls how far the 2nd folding knife moves.
- The 2nd folding knife is used for the 2nd folding in the 3rd folding mode.

(2) 2nd folding knife operation

- Push the 1st folded paper [2] conveyed by the 1st folding roller [1] to the place where the roller at the bottom of the 1st folding roller and the 2nd folding roller [3] are nipped by the 2nd folding knife [6].
- The 2st folding roller pulls in the paper and presses and conduct the 2nd fold between the rollers.
- The 2nd folding place is controlled according to the period since the 2nd folding sensor (PS112) [4] detects the leading edge of the paper until the 2nd folding knife is pushed out.

[1]	1st Folding Roller	[2]	Paper
[3]	2st Folding Roller	[4]	2nd folding sensor (PS112)
[5]	2nd folding gate	[6]	2nd folding knife
[7]	2nd folding knife home sensor (PS111)	-	

(3) 2nd Folding knife control

- When the 2nd folding sensor (PS112) detects the leading edge of the paper after the 1st folding and turns ON, the 2nd folding knife motor (M110) turns ON (in reverse rotation) after a specified period of time.
- The 2nd folding knife starts operating after M110 turns ON (in reverse rotation), and push the paper to the roller at the bottom of the 1st folding roller and the 2nd folding roller.
- When the 2nd folding knife starts operating, the 2nd folding knife home sensor (PS111) turns OFF.
- When PS111 turns ON, M110 turns OFF to stop the forward rotation after a specified period of time.

6.3.5 Tri-folding conveyance control

- When the SD entrance sensor (PS102) detects the trailing edge of the last paper and turns OFF, the 2nd folding gate solenoid (SD101) turns ON after a specified period of time and switches the 2nd folding gate to tri-folding conveyance path.
- When the saddle stitching alignment motor (M104) completes [2] the alignment of the last sheet, the 1st folding knife motor (M107) and the folding roller motor (M108) turn ON [3] after a specified period of time.
- When the 2nd folding sensor detects [4] the leading edge of the paper after the 1st folding, the 2nd folding knife motor (M110) turns ON [6] after a specified period of time.
- When M110 turns ON, the 2nd folding knife starts pushing the paper.
- When M110 switches the rotation from reverse to forward [7], M108 switches the conveyance speed from low to high [8].
- When the 2nd folding knife home sensor (PS111) turns ON, M110 finishes the 2nd folding after a specified period of time [9].
- When the folding exit sensor (PS113) detects the trailing edge of the paper, SD101 turns OFF. At this time, M108 turns OFF [10] after a specified period of time.

[7]	Paper exit belt	-	

7.2 Drive

[1]	Paper exit belt	[2]	Saddle stitching exit motor (M120)
-----	-----------------	-----	------------------------------------

7.3 Operation

7.3.1 Paper exit control

(1) Paper exit mechanism

- When the bundle of paper is on the Output Tray, the actuator turns ON the tray exit sensor /1 (PS120) and the tray exit sensor /2 (PS121).
- The saddle stitching exit motor (M120) drives the paper exit belt to move the ejected bundle of paper.

(2) Paper exit operation

- When PS120 turns ON by exiting the bundle of paper, M120 turns ON after a specified period of time.
- When M120 turns ON, the paper exit belt conveys the bundle of paper to the rear side.

(3) Exit tray full detection

- When both of PS120 and PS121 are ON for more than the specified time period, the tray is judged as full.

7.3.2 Output tray lift up control

- When the bundle of ejected sheets are stacked around the paper exit opening, lifting the lift up handle [5] moves the sheets to the rear automatically.
- The tray lift up sensor (PS122) [3] is equipped on the bottom of the Output Tray.
- When the Output Tray is positioned horizontally, the actuator [2] turns ON PS122.
- When the output tray is lifted, the actuator is also lifted. It turns OFF PS122.
- When PS122 turns OFF, the saddle stitching exit motor (M120) turns ON and rotates the paper exit belt.
- The rotation of the paper exit belt moves the bundle of paper around the paper exit opening to the rear of the output tray.
- When the output tray is lifted, the exit auxiliary roller [1] pushes the bundle of paper against the paper exit belt. Therefore, the conveyance performance is improved.

2.3 Operation

2.3.1 Punch ready position movement control

- When the power is ON, the punch shift motor (M302) rotates to move the punch unit [2] to the home position until the punch shift home sensor (PS303) turns ON.
- When the punch mode is selected, M302 rotates to move the punch unit [2] so that the paper size sensor (PS305) [5] of the punch unit [2] is positioned on the front side [6] of the paper.
- PS305 consists of 5 sensors. Each sensor detects the following paper.

Sensor	Paper size
1	8 ¹ / ₂ x 11, A3, A4
2	9 x 11, 11 x 17
3	ISO-B4, ISO-B5, B5, 16K, B4, 8K
4	16KS, A4S, A5, 8 ¹ / ₂ x 11S, 5 ¹ / ₂ x 8 ¹ / ₂ , SRA4S, 8 x 13, 8 ¹ / ₄ x 13, 8 ¹ / ₂ x 13, 8 ¹ / ₈ x 13 ¹ / ₄ , ISO-B5S, 8 ¹ / ₂ x 14S
5	5 ¹ / ₂ x 8 ¹ / ₂ S, A5S, B5S

* The sensors are numbered 1 to 5 from the front side.

- The punch unit returns to the home position at the end of the job.

[1] Punch blade	[2] Punch unit
[3] Paper conveyance direction	[4] Paper
[5] Paper size sensor (PS305)	[6] Front side

2.3.2 Punch position correction control

For the punch unit positioned from the side edge of the paper to the inside (Refer to "[PK.2.3.1 Punch ready position movement control](#)"), the punch position is adjusted in the following procedure so that punching is made symmetrically to the center of paper at all times. The punch position correction is operated by moving the punch unit back and forth while conveying the paper.

- When the specified sensor [10] which is for the paper size in the paper size sensor (PS305) [11] detects paper and turns ON after the specified time since FNS entrance sensor (PS4) detects the leading edge of paper, it judges that paper side edge is on the rear side than the sensor. When the sensor remains being OFF without detecting paper, it judges that the paper side edge is on front side than the sensor. For punching on the paper conveyed from PI, it is started when the paper pass-through sensor /Up (PS201) or /Lw (PS206) detects the leading edge of the paper.
- When it judges that the paper side edge is on the front side than the sensor [1], the punch shift motor (M302) rotates in reverse to move the punch unit [13] to the front side [4]. After the specified time since PS305 turns OFF, M302 turns OFF. Then, M302 turns forward rotation ON to move back the punch unit to the rear side [3] for the specified distance. When PS305 turns ON from OFF, it detects as the side edge [9] and is the side edge reference position.
- When it judges that the paper side edge is on the rear side than the sensor, M302 rotates in forward to move the punch unit to the rear side. When PS305 turns ON from OFF, it detects the side edge. It is the side edge reference position.
- Once it detects the side edge reference position [9], the punch unit [13] is moved further so that the center of the punch blade [12] is positioned to the center of the paper [8]. The moving distance and its direction are depending on the paper size. It stops temporarily at the side edge reference position if the moving distance is a little.

[13]	Punch unit	[14]	Punch blade

2.3.3 Punch control

(1) Registration loop control

- When the FNS entrance sensor (PS1) detects the trailing edge of paper, the FNS conveyance motor (M1) stops temporarily. Thus the paper is pressed against the entrance roller forming a loop [3] to correct the bend. When the specified time has passed, M1 turns ON to restart conveying the paper.
- This operation is not performed for paper that weights 136 g/m² or more or that is fed from PI. It is also not performed during the through mode (non-punch mode).
- When punching the paper conveyed from PI, the loop is formed on the PI side. For details, refer to [PL Theory of Operation PI-502](#).

[1]	Previous device	[2]	Entrance roller
[3]	Loop	[4]	PK

(2) Punch control (for 2/4-Hole)

- The main body start signal drives the FNS conveyance motor /2 (M2).
- In the punching mode, the motor (M2) stops temporarily after the FNS entrance sensor (PS1) detects the trailing edge of paper.
- At the same time, the punch motor (M301) [1] drives to move the punch drive board (for 2-Hole) [3] and the punch drive board (for 4-Hole) [5] horizontally.
- Punch drive board has a wavy groove [4], and the punch blades [6] and [7] move up and down along it. When the punch blade goes down, it performs a punch.
- The FNS conveyance motor /2 (M2) restarts rotating to convey paper after the specified time since it stops temporary.

[1]	Punch motor (M301)	[2]	Front side
[3]	Punch drive board (for 2-Hole)	[4]	Wavy groove
[5]	Punch drive board (for 3-Hole)	[6]	Punch blade (for 2/4-Hole)
[7]	Punch blade (for 4-Hole)	-	

(a) Punch control for 2-Hole

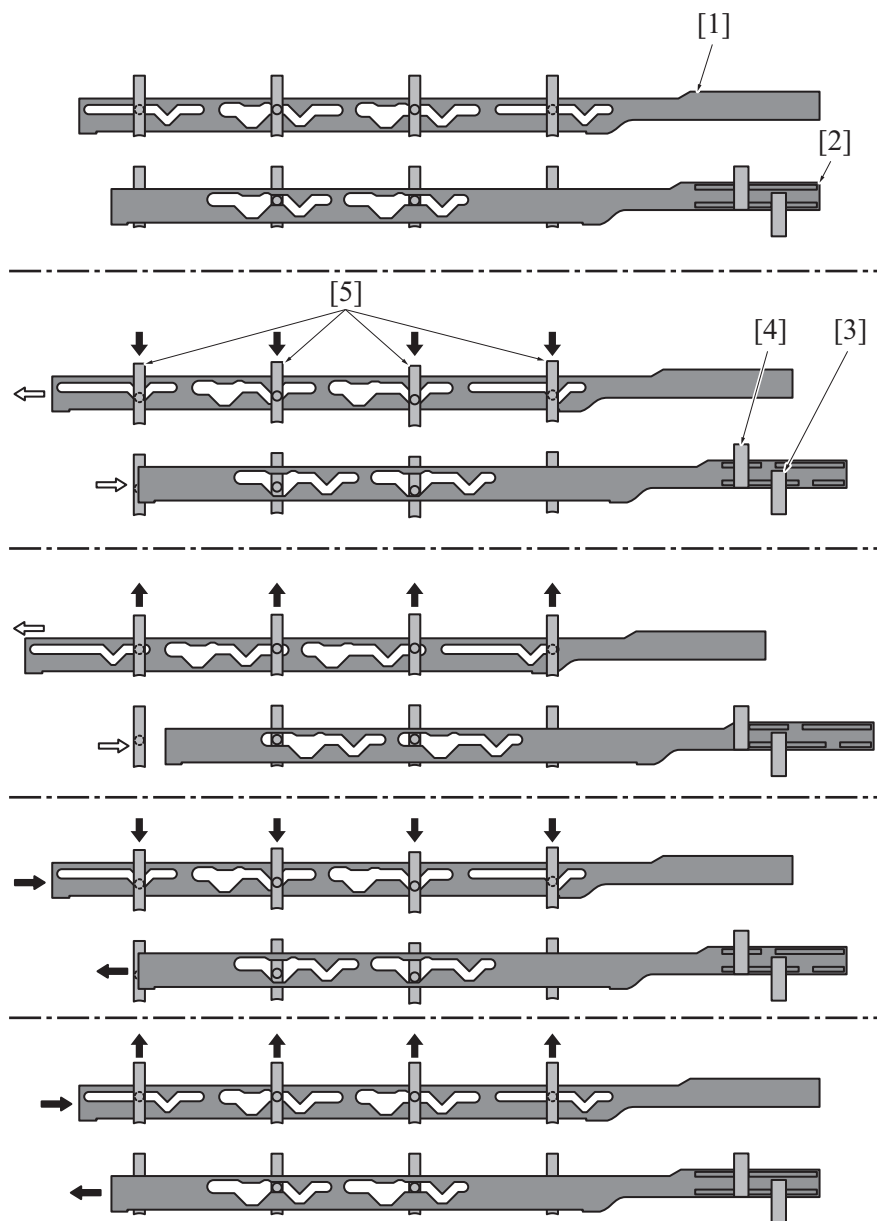

- When the punch drive board motor turns forward, the punch drive board (for 2-Hole) [2] moves horizontally to the front and the punch drive board (for 4-Hole) [1] moves horizontally to the rear.
- As the punch drive board (for 2-Hole) [2] moves horizontally, the punch home sensors /1 (PS301) [3] and /2 (PS307) [4] are shaded and turned OFF.
- The punch blade (for 2/4-Hole) [5] moves down along with the wavy groove on the punch drive board (for 2-Hole) [2] to perform the 2-Hole punch.
- When the punch drive board (for 2-Hole) [2] moves horizontally again, the punch blade (for 2/4-Hole) [5] moves back to the original position. Then, the punch home sensor /1 (PS301) [3] turns ON.
- At this time, the punch home sensor /2 (PS307) [4] remains OFF.
- When the punch home sensor /1 (PS301) [3] turns ON and the punch home sensor /2 (PS307) [4] turns OFF, the punch drive motor stops to complete the punching operation.
- To perform the punching operation on the subsequent paper, the punch drive motor reverses and performs the punching operation again.
- When the punch home sensors /1 (PS301) [3] and /2 (PS307) [4] turn ON, the punch motor (M301) stops to complete the punching operation.

[1]	Punch drive board (for 4-Hole)	[2]	Punch drive board (for 2-Hole)
[3]	Punch home sensor /1 (PS301)	[4]	Punch home sensor /2 (PS307)
[5]	Punch blade (for 2/4-Hole)	-	

(b) Punch control for 4-Hole

- When the punch drive board motor reverses, the punch drive board (for 2-Hole) [2] moves horizontally to the rear and the punch drive board (for 4-Hole) [1] moves horizontally to the front.
- As the punch drive board (for 2-Hole) [2] moves horizontally, the punch home sensors /1 (PS301) [3] and /2 (PS307) [4] are shaded and turned OFF.
- The punch blade (for 4-Hole) [5] moves down along with the wavy groove on the punch drive board (for 4-Hole) [1] to perform the 4-Hole punch.
- When the punch drive board (for 4-Hole) [1] moves horizontally again, the punch blade [3] moves back to the original position. Then, the punch home sensor /2 (PS307) [4] turns ON.
- When the punch home sensor /1 (PS301) [3] turns OFF and the punch home sensor /2 (PS307) [4] turns ON, the punch drive motor stops to complete the punching operation.
- To perform the punching operation on the subsequent paper, the punch drive motor turns forward and performs the punching operation again.
- When the punch home sensors /1 (PS301) [3] and /2 (PS307) [4] turn ON, the punch motor (M301) stops to complete the punching operation.

[1]	Punch drive board (for 4-Hole)	[2]	Punch drive board (for 2-Hole)

[5]	Punch blade (for 4-Hole)	-	

(3) Punch control (2/3-Hole)

- The main body start signal drives the FNS conveyance motor /2 (M2).
- In the punching mode, the motor (M2) stops temporarily after the FNS entrance sensor (PS1) detects the trailing edge of paper.
- At the same time, the punch motor (M301) [1] drives to move the punch drive board (for 2-Hole) [3] and the punch drive board (for 3-Hole) [5] horizontally.
- Punch drive board has a wavy groove [4], and the punch blades [6] and [7] move up and down along it. When the punch blade goes down, it performs a punch.
- The FNS conveyance motor /2 (M2) restarts rotating to convey paper after the specified time since it stops temporary.

[5]	Punch drive board (for 3-Hole)	[6]	Punch blade (for 2-Hole)
[7]	Punch blade (for 3-Hole)	-	

(a) Punch control for 2-Hole

- When the punch drive board motor turns forward, the punch drive board (for 2-Hole) [2] moves horizontally to the front and the punch drive board (for 3-Hole) [1] moves horizontally to the rear.
- As the punch drive board (for 2-Hole) [2] moves horizontally, the punch home sensors /1 (PS301) [3] and /2 (PS307) [4] are shaded and turned OFF.
- The punch blade (for 2-Hole) [5] moves down along with the wavy groove on the punch drive board (for 2-Hole) [2] to perform the 2-Hole punch.
- When the punch drive board (for 2-Hole) [2] moves horizontally again, the punch blade (for 2-Hole) [5] moves back to the original position. Then, the punch home sensor /1 (PS301) [3] turns ON.
- At this time, the punch home sensor /2 (PS307) [4] remains OFF.
- When the punch home sensor /1 (PS301) [3] turns ON and the punch home sensor /2 (PS307) [4] turns OFF, the punch drive motor stops to complete the punching operation.
- To perform the punching operation on the subsequent paper, the punch drive motor reverses and performs the punching operation again.
- When the punch home sensors /1 (PS301) [3] and /2 (PS307) [4] turn ON, the punch motor (M301) stops to complete the punching operation.

[1]	Punch drive board (for 3-Hole)	[2]	Punch drive board (for 2-Hole)

3. PUNCH-HOLE SCRAPS BOX SECTION

3.1 Configuration

[1]	Punch scraps box set sensor (PS304)	[2]	Punch scraps box full sensor (PS302)
[3]	Punch scraps box	[4]	Front side
[5]	Projection	[6]	Conductive PET

3.2 Drive

The punch scraps box section comprises no moving parts.

3.3 Operation

3.3.1 Punch scraps dropping

- The conductive PET [1] is attached on the lower part of the punch unit. It swings together with the punch unit.
- The chute does not swing. Therefore, the conductive PET and the projection [2] of the chute make contact with each other to shake the conductive PET and drop the punch scraps.

[1]	Conductive PET	[2]	Projection
-----	----------------	-----	------------

3.3.2 Punch scraps box control

(1) Punch scraps box full detection

The punch scraps generated by the punch operation falls in the punch scraps box [3]. The punch scraps box full sensor (PS302) [1] turns ON and transmits the "no punch scraps box" information to the main body when the punch scraps box becomes full of punch scraps.

(2) Punch scraps box detection

The punch scraps box set sensor (PS304) detects whether the punch scraps box is set or not. PS304 turns OFF and transmits the "no punch scraps box" information to the main body if the punch scraps box is not set.

2.2.2 Tray lift drive

15jft2c003nb

[1]	Front side	[2]	Tray lift motor /Lw (M202)
[3]	Tray lift motor /Up (M201)	-	

2.3 Operation

2.3.1 Tray lift mechanism

The tray lift motors /Up (M201) [2] and /Lw (M202) [7] move up and down the trays /Up and /Lw by rotating in the forward and reverse direction to drive the lift arms /Up [10] and /Lw [4] and move up and down the lift plates /Up [8] and /Lw [6], respectively.

At the upper limit positions, the tray upper limit sensors /Up (PS205) [1] and /Lw (PS209) [3] detect the actuators lifted up by the lift plates.

At the lower position of the tray, the tray lower limit sensors /Up (PS204) [9] and /Lw (PS210) [5] detect the actuators coupled with the lift arms /Up and /Lw.

15jft2c004na

[7]	Tray lift motor /Lw (M202)	[8]	Tray lift plate /Up
[9]	Tray lower limit sensor /Up (PS204)	[10]	Lift arm /Up

2.3.2 Pick-up mechanism

The pick-up solenoids /Up (SD201) and /Lw (SD202) [2] turn ON to pick up the paper. The release arm [5] held upward by the spring [1] lifts up the pick-up roller mounting plate [4] to release the pick-up roller [3]. When SD201 and SD202 turn ON, the release arm moves backward, and then the pick-up roller mounting plate and the pick-up roller fall down by their own weight. The pick-up roller driven by the transfer motor (M203) presses the paper and picks it up to transfer it to the separation section.

15jft2c005nb

[1]	Spring	[2]	Pick-up solenoid /Up (SD201)
[3]	Pick-up roller	[4]	Pick-up roller mounting plate

[5]	Release arm	-
-----	-------------	---

2.3.3 Separation mechanism

The separation roller [4] is driven to rotate in the opposite direction from the paper transfer direction [2]. However, when no paper is conveyed or only 1 sheet of paper is conveyed, the frictional force generating between the paper feed roller [1]/paper and the separation roller [4] is greater than the frictional force of the torque limiter [3]. Accordingly, the separation roller [4] rotates in the direction of the paper conveyance [2] to convey paper to the vertical conveyance section.

When 2 or more sheets of paper are conveyed, the frictional force between these sheets of paper is smaller than the frictional force of the torque limiter [3] and the separation roller rotates in the reverse direction to prevent the lower most paper from being conveyed.

15jft2c006na

[1]	Paper feed roller	[2]	Paper conveyance direction
[3]	Torque limiter	[4]	Separation roller
[5]	2nd sheet of paper	[6]	1st sheet of paper
[7]	Pick-up roller	-	

2.3.4 Registration control

Transmitting the FS start signal [1], the transfer motor (M203) rotates in low speed and the pick-up solenoids /Up (SD201) and /Lw (SD202) turn ON. At the time, the tray lift motors /Up (M201) and /Lw (M202) rotate in the forward direction to lift up the trays /Up and /Lw.

M201 and M202 stop when the tray upper limit sensors /Up (PS205) and /Lw (PS209) turn ON [2], and after a specified period of time, the transfer clutch /Up (CL201) and /Lw (CL202) turn ON and the paper is picked up from the tray. Only 1 sheet of paper is transferred by the transfer roller because of the separation roller.

M203 rotates in high speed when the paper reaches the paper passage sensors /Up (PS201) and /Lw (PS206) [3]. At the time, the paper is pressed against the transfer roller and forms a loop because the registration clutch (CL203) is OFF. After a specified period of time, CL203 turns ON [4] and M203 drives the paper to FS.

M203 switches to rotate in low speed to feed the subsequent paper since the paper passed PS201/PS206 [5], and then CL203 turns OFF after a specified period of time.

[1]	FS operation start signal ON	[2]	Tray reached at the upper limit
[3]	Paper reached the paper passage sensors /Up (PS201) and /Lw (PS206)	[4]	Registration clutch (CL203) ON
[5]	Trailing edge of the paper passed the paper passage sensors /Up (PS201) and /Lw (PS206)	-	

2.3.5 Paper size detection control

The paper size VRs /Up (VR201) [1] and /Lw (VR202) [3] coupled with the side guide [2] detects the paper size in the main scan direction. The paper set sensors /Up (PS203) [5] and /Lw (PS212) [4] and the L size sensor /Lw (PS208) [6] detects the paper size in the sub scan direction.

2.2 Drive

2.2.1 Conveyance drive

[1]	Conveyance drive motor	[2]	Conveyance roller /1
[3]	Conveyance roller /2	-	

2.3 Operation

2.3.1 Conveyance control

- Upon receiving of a print job, the tray lift motors /Up (M201) and /Lw (M202) are driven to move up the trays /Up and /Lw.
- After the tray upper limit sensors /Up (PS205) and /Lw (PS209) turn ON [2], M201/M202 stop and the conveyance motor (M203) drives at low speed after the specified time.
- After the specified time since the 1st sheet reaches the paper passage sensor /Lw (PS206) [3], M203 switches to high speed, and the FNS conveyance motor /4 (M4) drives.
- After the specified time since the 1st sheet passes PS206 [4], M203 switches to low speed.
- After a specified period of time since the 2nd paper gets to PS206 [6], M203 and M4 stop. They drive again after a specified period of time since the paper that fed from the main body passes the FNS entrance sensor (PS1) [7].
- After the specified time since the 2nd paper passes PS206 [8], M203 and M4 stop.

2.2 Drive

Is502to2002c

[1]	Entrance conveyance lock solenoid (SD5)	[2]	Entrance jam release lever
[3]	Coupling jam release lever	[4]	Coupling conveyance lock solenoid (SD11)

2.3 Operation

2.3.1 Door open/close mechanism

While the LS is in operation, the front door lock solenoid (SD4) locks the front door, thus making it impossible to open and close it. However, while in the coupling conveyance (coupling mode) or while exiting paper into the sub tray (sub tray mode), the front door can be opened and closed.

Pressing the paper removing switch on the stacker tray operation board (TOB) brings down the stacker tray. When the stacker tray arm release sensor (PS15) is turn ON, SD4 turns OFF immediately.

The lock is released due to SD4 being turned off and the front door can be opened and closed.

2.3.2 Jam release lever lock mechanism

The entrance guide plate and the coupling guide plate are provided with a jam release lever to release jams. The entrance conveyance lock solenoid (SD5) and the coupling conveyance lock solenoid (SD11) operate each of the jam release levers.

- ON/OFF timing of SD5 and SD11

	Operation timing
ON (Lock)	When the stacker tray goes up, and while in printing
OFF (Release)	While in standing by, when the stacker tray goes down after completion of printing, and when the front door is open (except in coupling mode and in sub tray mode)

3. ENTRANCE CONVEYANCE SECTION

[5]	Entrance roller	[6]	1st gate
[7]	Coupling conveyance roller /1	[8]	2nd gate

3.3 Operation

3.3.1 Path switching

The path along which paper conveyed to the entrance guide plate is conveyed varies according to the operation mode. The 1st gate and the 2nd gate switch the conveyance path.

(1) 1st gate

The switching of the conveyance path is made between the stacker tray output (stacker tray non-sort mode and stacker tray sort mode) and the sub tray paper exit (sub tray mode) and the coupling conveyance (coupling mode).

[1]	Sub tray mode/coupling mode	[2]	1st gate
[3]	Stacker tray non-sort mode/stacker tray sort mode		

(2) 2nd gate

The conveyance path is switched between the sub tray paper exit (sub tray mode) and the coupling conveyance (coupling mode).

[1]	Coupling mode	[2]	Sub tray mode
[3]	2nd gate		-

3.3.2 Conveyance line speed control

The conveyance process speed of the entrance roller and the coupling conveyance rollers 1/ and /2 that are driven by the conveyance motor (M/2) varies according to the exit line speed of the previous device (main body or post processing machine). These operations are common to all the modes.

(1) When the exit line speed of the previous device is 1000mm/s

[1]	Paper exit sensor of previous device ON	[2]	1st sheet of paper
[3]	2nd sheet of paper	[4]	3rd sheet of paper

(2) When the exit line speed of the previous device is other than 1000mm/s

[1]	Paper exit sensor of previous device ON	[2]	1st sheet of paper
[3]	2nd sheet of paper	[4]	3rd sheet of paper

3.3.3 Paper cooling mechanism

Paper conveyed to the LS is likely to curl up due to fusing heat. Heat storage accumulated in paper stacked during continuous printing causes tacking (sheets of paper sticking hard each other by toner) when toner that has been fused is refused and adheres. So, fresh air is blown on the paper from under the entrance guide plate and above the path guide of the upper surface of the paper stack section, thus cooling down the paper to correct curling and prevent tacking.

4.3 Operation

4.3.1 Stacker tray conveyance

While in the stacker tray non-sort mode and the stacker tray sort mode, paper is conveyed into the stacker tray.

(1) De-curler

Paper that has passed through the 1st gate is conveyed to the grip belt by the de-curler roller. At this time, the de-curler roller corrects the curled paper.

(2) Grip conveyance

Paper conveyed by the de-curler roller enters and is held by the grip provided on the grip belt. The paper held by the grip is conveyed to the section above the stacker tray by the rotation of the grip belt.

2 grips are provided on the grip belt and each one of them conveys paper one after the other. The grip conveyance home sensor (PS5) controls the position where the grip is waiting for paper from the de-curler roller.

[1] Paper	[2] De-curler roller
[3] Grip	[4] Stacker tray
[5] Grip	[6] Grip belt
[7] Grip conveyance home sensor (PS5)	-

(3) Front stopper control

Paper conveyed by the grip strikes against the front stopper equipped to the shift unit and is released from the grip. At this time, the shift unit has been moved to the position specified in advance for each paper size.

2 types of the front stoppers, more specifically, a movable type and a stationary type, are employed. In stacker tray non-sort mode, only the movable type front stopper is employed. A distance of 20mm is kept between the position where the movable type front stopper stops and the position in which the stationary type front stopper is, which is the shift distance.

When stacking tab paper, paper is aligned by either stationary type front stopper or movable type front stopper. Therefore, it is impossible to shift tab paper for stacking.

For the front stopper solenoid (SD9) that drives the movable type front stopper, a latch-type solenoid is employed that is not required to be energized to maintain the ON state. However, a latch-type solenoid requires a different control signal for each ON and OFF action.

[1] Entrance sensor (PS4)	[2] Paper
[3] Movable type front stopper	[4] 20mm
[5] Stationary type front stopper	[6] Grip
[7] Stacker tray	[8] Grip belt
[9] Conveyance unit	[10] Grip

(a) Stacker tray non-sort mode

Example: A4 4 sheets, 1 set

[1] Paper exit sensor of previous device ON	[2] The conveyance unit starts to move
[3] 1st sheet of paper	[4] Movable type front stopper ON
[5] 2nd sheet of paper	[6] 3rd sheet of paper
[7] Last sheet of paper	[8] Movable type front stopper OFF

(b) Stacker tray sort mode

Example: A4 2 sheets, 2 sets

[1] Paper exit sensor of previous device ON	[2] The conveyance unit starts to move
[3] Shift of the 1st sheet of paper	[4] Movable type front stopper ON
[5] Shift of the 2nd sheet of paper	[6] Non-shift of the 1st sheet of paper
[7] Movable type front stopper OFF	[8] Non-shift of the 2nd sheet of paper
[9] Movable type front stopper OFF secured	[10] Movable type front stopper OFF secured

(4) Job partition plate

In stacker tray sort mode, the trailing edge of the shift paper is restricted by the job partition plate and the paper is exited onto the stacker tray 20mm shifted from the non-shift paper. At this time, the upper surface of the non-shift paper does not come to the same level as the lower edge of the job partition plate and the 1st sheet of the shift paper is in possibility of getting into the lower side of the job partition plate. To prevent this, the job partition plate is attached to the upper surface of the non-shift paper that has been exited to restrict the entry of the paper. For the job partition solenoid (SD2) that drives the job partition plate, a latch-type solenoid is employed that is not required to be energized to maintain the ON state. However, a latch-type solenoid requires a different control signal for each ON and OFF action.

[1] Entrance sensor (PS4)	[2] Job partition plate
[3] Non-shift paper	[4] Stacker tray
[5] Shift paper	-

(a) Stacker tray non-sort mode

Example: A4 4 sheets, 1 set

[1] Paper exit sensor of previous device ON	[2] 1st sheet of paper
[3] Job partition plate close	[4] 2nd sheet of paper
[5] Job partition plate close	[6] 3rd sheet of paper
[7] Job partition plate close	[8] Last sheet of paper
[9] Job partition plate close	-

(b) Stacker tray sort mode

Example: A4 2 sheets, 2 sets

[1] Paper exit sensor of previous device ON	[2] Shift of the 1st sheet of paper
[3] Job partition plate open (shift amount: 20mm)	[4] Shift of the 2nd sheet of paper
[5] Non-shift of the 1st sheet of paper	[6] Job partition plate close
[7] Non-shift of the 2nd sheet of paper	[8] Job partition plate close

(5) Rear stopper control

While in the stacker tray sort mode is in shifting, the rear stopper is left open and this plays as a guide for the trailing edge of paper.

To assist the separation of paper released from the grip, the paddle is rotated at a high speed.

For the rear stopper solenoid (SD3) that drives the rear stopper, a latch-type solenoid is employed that does not need to be energized to maintain the ON state. However, a latch-type solenoid requires a different control signal for each ON and OFF action.

[1] Paddler	[2] Entrance sensor (PS4)
[3] Rear stopper	[4] Paper position while in the stacker tray sort mode
[5] Paper position while in the stacker tray non-sort mode	-

(a) Stacker tray non-sort mode

Example: A4 4 sheets, 1 set

[1] Paper exit sensor of previous device ON	[2] 1st sheet of paper
[3] Rear stopper close	[4] 2nd sheet of paper
[5] Rear stopper close	[6] 3rd sheet of paper
[7] Rear stopper close	[8] Last sheet of paper
[9] Rear stopper close	-

(b) Stacker tray sort mode

Example: A4 2 sheets, 2 sets

[1] Paper exit sensor of previous device ON	[2] Shift of the 1st sheet of paper
[3] Rear stopper open	[4] Shift of the 2nd sheet of paper
[5] Non-shift of the 1st sheet of paper	[6] Rear stopper close
[7] Non-shift of the 2nd sheet of paper	[8] Rear stopper close

(6) Paper press arm

The paper that has been released from the grip is pressed one at a time onto the stacker tray by the paper pressure arms /1, /2 and /3 to be loaded on the stacker tray. However, the operation of the paper pressure arm /2 is limited only to the paper size larger than B4.

Is502to2025e

[1] Paper exit sensor of previous device ON	[2] 1st sheet of paper
[3] 2nd sheet of paper	[4] Last sheet of paper

(7) Alignment plate control

The alignment plate aligns each sheet of paper loaded on the stacker tray.

Is502to2026e

[1] Paper exit sensor of previous device ON	[2] Movement to a position specified for each paper size
[3] 1st sheet of paper	[4] Alignment of the 1st sheet of paper
[5] 2nd sheet of paper	[6] Alignment of the 2nd sheet of paper
[7] 3rd sheet of paper	[8] Alignment of the 3rd sheet of paper
[9] Last sheet of paper	[10] Alignment of the last sheet of paper
[11] Returning to the home position	-

(8) Stacker tray up down control

The paper empty sensor (PS6) detects the upper surface of paper loaded on the stacker tray through the paper press arm /3. When PS6 is turned off by loading exited paper, the stacker tray up down motor (M1) turns on to lower the stacker tray down to the position at which PS6 turns on. The stacker tray is thus held at a fixed height when paper is being exited.

The number of sheets of paper loaded on the stacker tray is detected by the 2,000 sheets stacked sensor (PS13) and the 5,000 sheets stacked sensor (PS14) provided on the up down path of the stacker tray and displayed on the operation panel. (The main unit makes 3,000 sheets stacked detection.)

When the hand cart once pulled out is put back to its original position, the stacker tray moves up to return to its home position. If the paper detection sensor (PS19) detects that paper is loaded on the stacker tray, the tray stops moving up in order to prevent the uplifted paper from damaging the alignment plate.

(9) Hand cart detection mechanism

The hand cart set switch (RS1) detects the set condition of the hand cart. The set condition of the stacker tray is detected by checking to see if the light from the stacker tray set LED (LED1) gets to the stacker tray set sensor (PS1).

4.3.2 Coupling conveyance

In coupling mode, paper is conveyed to the device connected to the subsequent stage of the LS through the coupling conveyance section.

(1) Line speed switching

When paper is conveyed from the main body, the conveyance motor (M2) at the entrance conveyance section is rotated at the same speed as the conveyance speed of the main body. When paper is conveyed to the LS, the speed of rotation of M2 is increased up to 1,000mm/s to convey paper.

4.3.3 Sub tray conveyance

In sub tray mode, paper is exited into the sub tray.

(1) Line speed switching

[1]	Paper exit sensor of previous device ON	[2]	1st sheet of paper
[3]	2nd sheet of paper	[4]	Last sheet of paper

(2) Paper full control

When the number of the sheets of paper discharged on the sub-tray gets to 200, the sub tray full sensor (PS9) turns ON to give indication of "paper full" on the operation panel.

2.3 Operation

2.3.1 Conveyance path switching

The conveyance path of the paper that has been conveyed to the entrance guide plate varies according to the presence of a punch or folding, the tray into which paper is exited, and the paper size. The entrance gate, the sub tray gate, the S size gate, the L size gate and the folding gate make the switching of the conveyance path. (For details of the folding gate, refer to [PL.4. FOLDING CONVEYANCE SECTION](#))

(1) Entrance gate

The entrance gate solenoid (SD1) switches between the straight conveyance and the punch/folding conveyance by. In the straight mode, the SD1 remains OFF.
When conveying the 1st sheet of paper for punching/folding operation, SD1 is energized a specified period of time after the start button is turned ON.
For the 2nd and the succeeding sheets of paper, SD1 is energized in accord with the conveyance direction of the succeeding page after the preceding page passes through the FD entrance sensor (PS1).

fd501to2005c

[1]	Entrance gate	[2]	Punch mode or folding mode
[3]	Straight mode	-	

(2) Sub tray gate

The sub tray gate solenoid (SD9) switches between the main tray paper exit and the sub tray paper exit. In the mode of the main tray paper exit, the SD9 remains OFF.
When exiting the 1st sheet of paper into the sub tray, switch the SD9 a specified period of time after the start button is turned ON.
For the 2nd and the succeeding sheets of paper, SD9 is energized in accord with the paper exit direction of the succeeding page after the preceding page passes through the intermediate conveyance sensor (PS13).

fd501to2006c

[1]	Sub tray gate	[2]	Main tray exit
[3]	Sub tray exit		-

(3) S size gate

Switching is made according to the paper size and the presence of folding. S size gate solenoid (SD3) makes the drive of the gate. In the punch mode with no folding and in the case of the S size paper, SD3 remains OFF.

When conducting the folding operation or when feeding the 1st sheet of large-size paper, switch SD3 a specified period of time after the start button is turned ON.

For the 2nd and the succeeding sheets of paper, switch the sub tray gate solenoid (SD9) in accord with the paper exit direction of the succeeding page after the preceding page passes through the punch conveyance sensor (PS5).

S size paper: The length in the sub scan direction is 216mm or less.

fd5011to2007c

[1]	S size gate	[2]	For the folding mode (regardless of the presence of a punch)
[3]	Punch conveyance sensor (PS5)	[4]	For the S size paper with a punch only

(4) L size gate

When folding the paper, the conveyance path is switched back and forth for each paper conveyance to prevent the succeeding paper from coming into contact with the trailing edge of the L size paper that is in folding process.

L size gate solenoid (SD4) makes the drive of the gate.

L size paper: The length in the sub scan direction is 217mm or more.

fd501to2008c

[1] L size gate (SD4-OFF position)	[2] Punch registration sensor (PS6)
------------------------------------	-------------------------------------

For the control of the L size gate, SD4 stands by at the OFF position (outer path) for the 1st sheet of paper to pass through. The 1st sheet of paper turns ON SD4 a specified period of time after the punch registration sensor (PS6) turns ON, and makes the switch to the inner path.

When the 2nd sheet of paper turns ON PS6, SD4 turns OFF after a specified period of time to make the switch to the outer path. The above operations are repeated for each sheet of paper.

fd501to2039e

2.3.2 Conveyance line speed control

The conveyance line speed of each conveyance section varies according to the type of paper and paper weight.

(1) Line speed switching

The following list shows each of conveyance sections and the range of the conveyance line speed.

Conveyance section	Conveyance line speed
Entrance conveyance section	290mm/s to 1000mm/s
Intermediate conveyance section	800mm/s to 1000mm/s
Punch conveyance section	490mm/s to 1000mm/s
Main tray paper exit section	205mm/s to 1000mm/s
Sub tray paper exit section	500mm/s

2.3.3 Alignment control

On paper conveyed to the punching position, the 2 alignment plates make a alignment operation to improve the accuracy of the punch hole positioning and the folding. The forward and reverse rotation of the alignment motor (M12) drives the alignment plate. The alignment plate home sensor (PS10) detects its home position.

When the start button is turned ON, M12 rotates in the forward direction to move the alignment plates /Fr and /Rr to the standby position of the paper size.

When the paper is conveyed to the punch position in a specified number of steps after it passes through the FD entrance sensor (PS1), the roller solenoid /1 (SD5), the roller solenoid /2 (SD6), the roller solenoid /3 (SD7) and the roller solenoid /4 (SD8) release the pressure of each roller and M12 conducts the alignment operation.

The roller solenoids that release each of the rollers from pressure are modified according to the size and the direction of paper aligned.

A specified period of time after completion of punching the last paper, M12 rotates in the reverse direction to bring the alignment plate back to the home position.

2.3.4 Gap recovery control

When conveying 2 pages at a time, conduct the gap recovery control after alignment.

- Note**
- The gap recovery control is only for 1200/1200P/1051 and 1250/1250P/1052.

[5]	Roller solenoid /1 (SD5)	[6]	One-way clutch

(1) Small-size paper

Once the roller solenoid /1 (SD5) turns OFF after the alignment and presses each roller, the punch conveyance motor (M2) [4] rotates in the reverse.

The drive of the punch conveyance motor (M2) [4] is passed to the vertical conveyance roller /Rt [2] to rotate it in the reverse. At this time, the vertical conveyance roller /Lt [1] does not rotate in the reverse but keeps stopping since it has the one-way clutch [6]. According to this operation, only the vertical conveyance roller /Rt [2] side of the overlapped paper is returned to adjust the gap of paper.

(2) Large-size paper

Once the roller solenoids /1 (SD5) turns OFF after the alignment and presses each roller, the punch conveyance motor (M2) [4] rotates in the reverse.

The drive of the punch conveyance motor (M2) [4] is passed to the vertical conveyance roller /Rt [2] to rotate it in the reverse. At this time, the vertical conveyance roller /Lt [1] does not rotate in the reverse but keeps stopping since it has the one-way clutch [6]. According to this operation, only the vertical conveyance roller /Rt [2] side of the overlapped paper is returned to adjust the gap of paper.

At the same time as the punch conveyance motor (M2) [4] stops, the roller solenoids /2 and /3 (SD6/SD7) turn OFF and press each roller.

[5]	One-way clutch (2-hole punch)	[6]	Eccentric cam
[7]	Front side direction	[8]	3-hole punch edge
[9]	Eccentric cam	[10]	One-way clutch (3-hole punch)

3.3 Operation

(1) Punch control

The punch registration motor (M13) drives the punch rear claw to hold down the trailing edge of paper, and the punch motor (M10) drives the eccentric cam for punching.

After alignment operations, the roller solenoids /1 to /4 are turned ON to let paper be placed in the unfixed condition. The paper, however, is held by the curvature of the conveyance section. Then, the punch registration motor (M13) rotates a specified number of steps and the punch rear claw holds the trailing edge of paper to move it to the punching position. After a specified period of time, the punch motor (M10) drives for punching. After completion of punching, M13 returns the punch rear claw to the home position. The position of the home position is detected by the punch registration home sensor (PS11).

(2) Punch hole switching control

The punch hole is switched according to the rotational direction of the punch motor (M10).

For 2-hole, M10 rotates counterclockwise to drive the 2-hole punch edge. For 3-hole, M10 rotates clockwise to drive the 3-hole punch edge. The 2-hole punch home sensor (PS8) detects the position of the 2-hole punch edge, and the 3-hole/4-hole punch home sensor (PS9) detects the position of the 3-hole punch edge.

(3) Punch-hole scraps box control

The punch scraps box set sensor (PS12) detects the setting of the punch scraps box, and the punch scraps full sensor (PS26) detects the full condition of the punch scraps box.

[3]	2nd folding roller /1 mounting board	[4]	2nd folding guide
[5]	1st folding roller /1 mounting plate	[6]	1st folding guide

4.3 Operation

4.3.1 Registration control

The paper that has passes through the punch registration sensor (PS6) and arrives at the folding conveyance section is pressed against the registration roller to make adjustments for skew. A specified period of time after the PS6 turns ON, the 1st folding motor (M4) resumes the conveyance of paper. When no folding operation is made, no registration control is made. However, no folding is made on the paper that has entered the folding conveyance section from the folding entrance sensor side. The paper is conveyed vertically as is and exited to the main tray or the sub tray.

[1]	Punch registration sensor (PS6)	[2]	Registration roller
-----	---------------------------------	-----	---------------------

[3]	Folding entrance sensor (PS52)	-
-----	--------------------------------	---

4.3.2 Conveyance path switching

The folding gate solenoid (SD15) switches the conveyance path between the 2nd folding and the 3rd folding.
Except for the Z-Fold mode, a specified period of time after the 1st folding conveyance sensor (PS51) turns ON, SD15 turns ON to convey the paper to the 2nd folding after the 1st folding. In the Z-Fold mode, SD15 remains OFF and the paper is conveyed to the 3rd folding after the 1st folding.

[1]	Except for the Z-Fold mode	[2]	Folding gate

[1]	Change of the 1st folding roller /1 to the folding position	[2]	Change of the 1st folding roller /1 to the conveyance position
-----	---	-----	--

4.3.3 1st folding control

(1) Conveyance/folding switching control

The switching between conveyance and folding is made by moving the 1st folding roller /1. The 1st folding release motor (M14) drives the eccentric cam for this switching.
After the 1st folding conveyance sensor (PS51) turns ON, the paper is conveyed by a specified number of steps. While the paper is being conveyed, the 1st folding roller gears /1 [1] and /2 [4] rotate in the same direction since these 2 gears are interlocked each other through the idle gear [2].
After conveying the paper by the prescribed number of steps, M14 rotates until it gets to a specified number of steps. It rotates the eccentric cam [5] to allow the idle gear arm [3] to separate the idle gear [2] from the 1st folding roller gears /1 [1] and /2 [4]. At the same time, when M14 starts up, the cam provided on the inside of the 1st roller gear /2 [4] rotates to allow the 1st roller /1 and 1st roller /2 to contact each other closely to rotate 1st roller /1. get the gears engaged.
The phases of the 1st folding roller gears /1 [1] and the 1st folding roller gears /2 [3] are not aligned in the depth direction. Therefore, they do not engage with each other the idle gear [2] has been separated.

fd501to2017c

[1]	1st folding roller gear /1	[2]	Idle gear
[3]	Idle gear arm	[4]	1st folding roller gear /2
[5]	Eccentric cam	[6]	Seen from the FD side

In parallel with this, when the 1st folding release motor (M14) starts up, the winding-up of the wire that pulls the folding guide [2] to the right side is loosened to allow the folding guide [2] to push out the paper in the clearance between the 1st folding rollers /1 [1] and /2 [3]. As a result, the paper gets caught in the rollers to be folded.

fd501to2018c

[1]	1st folding roller /1	[2]	Folding guide
[3]	1st folding roller /2	-	

4.3.4 2nd folding control

(1) Conveyance/folding switching control

The switching between conveyance and folding is made by moving the 2nd folding roller /1. The 2nd folding release motor (M15) drives the eccentric cam for this switching.

After the 2nd folding conveyance sensor (PS53) turns ON, the paper is conveyed by a specified number of steps. While the paper is being conveyed, the 2nd folding roller gears /1 [1] and /2 [4] rotate in the same direction since these 2 gears are interlocked each other through the idle gear [2].

After conveying the paper by the prescribed number of steps, M15 rotates until it gets to a specified number of steps. It rotates the eccentric cam [5] to allow the idle gear arm [3] to separate the idle gear [2] from the 2nd folding roller gears /1 [1] and /2 [4]. At the same time, when M14 starts up, the cam provided on the inside of the 2nd roller gear /2 [4] rotates to allow the 2nd roller /1 [1] and 2nd roller /2 to contact each other closely to rotate the 2nd roller /1.

The phases of the 2nd folding roller gears /1 [1] and the 2nd folding roller gears /2 [3] are not aligned in the depth direction. Therefore, they do not engage with each other the idle gear [2] has been separated.

fd501to2019c

[1]	2nd folding roller gear /1	[2]	Idle gear
[3]	Idle gear arm	[4]	2nd folding roller gear /2
[5]	Eccentric cam	[6]	Seen from the FD side

In parallel with this, when the 2nd folding release motor (M15) starts up, the winding-up of the wire that pulls the folding guide [2] to the right side is loosened to allow the folding guide [2] to push out the paper in the clearance between the 2nd folding rollers /1 [1] and /2 [3]. As a result, the paper gets caught in the rollers to be folded.

fd501to2020c

[1]	2nd folding roller /1	[2]	Folding guide
[3]	2nd folding roller /2	[4]	Direction of paper exit

(2) Gate fold assist control

In the Gate fold mode, the 2nd folding roller solenoid (SD18) turns ON a specified period of time after the 1st folding motor (M4) starts folding. When SD18 starts up, the 2nd roller is pressed firmly. This is a measure taken to avoid a multiple fold that is apt to occur at the folding section of paper when the 2nd folding is made.

fd501to2021c

4.3.5 3rd folding control

(1) Conveyance/folding switching control

The switching between conveyance and folding is made by moving the 3rd folding roller /1. The 3rd folding release motor (M16) drives the eccentric cam for this switching.

After the 3rd folding conveyance sensor (PS54) turns ON, the paper is conveyed by a specified number of steps. While the paper is being conveyed, the 3rd folding roller gears /1 [1] and /2 [4] rotate in the same direction since these 2 gears are interlocked each other through the idle gear [2].

After conveying the paper by the prescribed number of steps, M16 rotates until it gets to a specified number of steps. It rotates the eccentric cam [5] to allow the idle gear arm [3] to separate the idle gear [2] from the 3rd folding roller gears /1 [1] and /2 [4]. At the same time, when M16 starts up, the cam provided on the inside of the 3rd roller gear /2 [4] rotates to allow the 3rd roller /1 [1] and 3rd roller /2 to contact each other closely to rotate the 3rd roller /1.

The phases of the 3rd folding roller gears /1 [1] and the 3rd folding roller gears /2 [4] are not aligned in the depth direction. Therefore, they do not engage with each other the idle gear [2] has been separated.

[1]	Main tray	[2]	Up/down wire
[3]	Tray up down motor (M11)	-	

5.3 Operation

5.3.1 Main tray up/down control

The up/down operation of the main tray is controlled by rotating the tray up/down motor (M11) in the normal or reverse direction.

(1) Main tray paper detection

A specified period of time after the main tray paper exit sensor (PS18) turns ON, M11 starts up to bring down the main tray until the main tray upper limit sensor (PS20) turns OFF, and then bring it up again until PS20 turns ON. After the paper is exited, PS20 maintains the distance between the upper surface of the paper exited in the main tray (the surface of the main tray when no paper exited) and the paper exit opening at a fixed distance to prevent the paper exited from having an uneven edge.

(2) Switching the operation of the main tray

The main tray is set so that it normally does not operate. When letting the main tray operate, insert the short connector [2] into the CN90 [1].

⚠ CAUTION

- Letting the main tray operate with the next option connected has a risk of damaging the machine. Be sure not to connect the short connector.

6.3 Operation

6.3.1 Sub tray full-status detection control

The plate of the sub tray (with folding tray) has lift structure, so it moves down with its left edge as the axis of the movement when the paper is exited to the sub tray. When paper that has been exited into the sub tray gets to the specified thickness, the sub tray paper full sensor (PS17) [2] turns ON to send the "sub tray paper full" information to the main body. Then, the main body displays the message on its operation panel. When the folded paper on the sub tray is unfolded and the sub tray paper full sensor (PS46) [1] turns ON, the "sub tray paper full" information is also sent to the main body.

[3]	Release arm	[4]	PI pick-up solenoid /Up (SD13), /Lw (SD14)
[5]	Pick-up roller /Up, /Lw	-	

7.3 Operation

7.3.1 Size detection control

For the size detection of a paper, there are the following 2 directions for each of the tray /Up and the tray /Lw: that is, the main scan direction and the sub scan direction.

The following 3 sensors: PI maximum size sensors /Up (PS47) and /Lw (PS48) [1], L size sensors /Up (PS35) and /Lw (PS41) [2] and S size sensors /Up (PS36) and /Lw (PS42) [3], detect the size in the sub scan when the PI paper set sensors /Up (PS44) and /Lw (PS45) [6] turn ON. When the PS44 and PS45 are OFF, the tray is judged "paper empty."

The paper size VR /Up (VR31) and /Lw (VR32) [4] which are interlocked with the paper regulation plate [5] detect the size in the main scan.

fd501to2031c

[1]	PI maximum size sensor /Up (PS47), /Lw (PS48)	[2]	L size sensor /Up (PS35), /Lw (PS41)
[3]	S size sensor /Up (PS36), /Lw (PS42)	[4]	Paper size VR /Up (VR31), /Lw (VR32)
[5]	Paper regulation plate	[6]	PI paper set sensor /Up (PS44), /Lw (PS45)

7.3.2 Up/down control

For the up/down of the tray, when the paper lift motors /Up (M8) [1] and /Lw (M9) [7] rotate in the normal and reverse directions, the lift arms /Up [11] and /Lw [9] start up to bring up and down the PI lift plates /Up [12] and /Lw [10]. The PI lift plate home sensors /Up (PS34) [2] and /Lw (PS40) [8] detect the lower limit position. The PI upper limit sensors /Up (PS32) [4] and /Lw (PS38) [6] detect the upper limit position at the position to which the actuators /Up [3] and /Lw [5] are pushed up by the PI lift plate.

When the PI paper set sensors /Up (PS44) and /Lw (PS45) are ON with the main body start button ON, M8 and M9 turn ON to bring up the PI lift plate. When PS32 and PS38 turn ON, M8 and M9 stop.

While in the copy/print operation, when PS32 and PS38 turn OFF from ON, M8 and M9 turn ON again to bring up the plate until PS32 and PS38 turn ON.

When PS44 and PS45 turn OFF with no paper left, M8 and M9 make a reverse rotation to move down the PI lift plate until PS34 and PS40 turn ON.

fd501to2032c

[1]	Paper lift motor /Up (M8)	[2]	PI lift plate home sensor /Up (PS34)
[3]	Actuator /Up	[4]	PI upper limit sensor /Up (PS32)

[9]	Lift arm /Lw	[10]	PI lift plate /Lw
[11]	Lift arm /Up	[12]	PI lift plate /Up

7.3.3 Pick-up mechanism

The picking-up of the paper [6] is made when the PI pick-up solenoids /Up (SD13) and /Lw (SD14) [5] turn ON. The release arm that is pressed down by the spring [1] in the direction of [2] presses down the paper feed arm [4] to place the pick-up rollers /Up and /Lw [7] in the release

condition. When SD13 and SD14 [5] turn ON, the release arm is released upward and the pick-up rollers /Up and /Lw [7] go down by their own weight. The pick-up roller that is rotated by the PI conveyance motor (M7) presses down the paper to pick it up.

fd501to2033c

[1]	Spring	[2]	Direction of the spring load
[3]	Release arm	[4]	Paper feed arm
[5]	PI pick-up solenoid /Up (SD13), /Lw (SD14)	[6]	Paper
[7]	Pick-up roller /Up, /Lw	-	

Paper feed arm retaining lever [1] is provided in the pick-up roller section to prevent multi-feed. By moving the paper feed arm retaining levers [1] on the front and back to inside, the pick-up rollers on the front and back are secured while the roller in the middle presses against paper. Multi-feed is prevented by reducing the pressure against paper when feeding papers.

fd501to2044c

7.3.4 Separation mechanism

The separation roller [4] is driven in the direction opposite to the paper conveyance [2]. However, when no paper is conveyed or only 1 sheet of paper is conveyed, the frictional force generating between the paper feed roller [1] and the separation roller [4] or the paper and the separation roller is greater than the frictional force of the torque limiter [3]. Accordingly, the separation roller [4] rotates in the direction of the paper conveyance [2] to convey paper to the vertical conveyance section.

When 2 or more sheets of paper are conveyed, the frictional force between these sheets of paper is smaller than the frictional force of the torque limiter [3] and the separation roller [4] rotates in the reverse direction to prevent the lower most paper from being conveyed.

When the PI registration clutches /Up (CL1) and /Lw (CL2) turn ON according to the PI paper feed demand signal, the paper feed roller [1], the separation roller [4] and the pick-up roller [7] rotate to convey the paper one at a time.

fd501to2034c

[3]	Torque limiter	[4]	Separation roller /Up, /Lw
[5]	2nd sheet of paper	[6]	1st sheet of paper
[7]	Pick-up roller /Up, /Lw	-	

7.3.5 Multi feed detection control

To detect a multi-feed while in the PI paper feed, the PI conveyance path is provided with the multi-feed sensor. The multi-feed sensor is an ultrasonic sensor made up of a pair of a sender and a receiver. This sensor receives ultrasonic waves sent from the multi-feed detection board /1 (MFDB1) [1] by the multi-feed detection board /2 (MFDB2) [2]. Based on the difference in the amount of ultrasonic waves received when a single sheet of paper [1] and the plural sheets of paper [4] pass through between the sender and the receiver, a check is made to see if paper has been multi-fed or not. The multi-feed detection function turns ON (operates) when the LED on the lower side is turned on by the multi-feed detection function selection button on the FD operation board (FDOB) and when no selection is made. It turns OFF (does not operate) when the LED on the upper side is turned on.

[1]	Multi-feed detection board /1 (MFDB1)	[2]	Multi-feed detection board /2 (MFDB2)
[3]	1 sheet of paper	[4]	More than 1 sheet of paper
[5]	Layer of air	-	

7.3.6 Paper empty detection control

The PI empty sensors /Up (PS33) and /Lw (PS39) detect the presence of paper in the tray section while in the print stop. PI set sensors /Up (PS44) and /Lw (PS45) detect the paper empty while in the print to stop the paper feed from the trays /1 to /5 when PS44 and PS45 detect the trailing edge of the last paper.

[5]	Sub tray exit roller	-
-----	----------------------	---

2.2.3 Gate drive/sub tray pressure release drive

2.3 Operation

2.3.1 Conveyance path switching control

(1) Entrance gate solenoid control

The entrance gate switches the path to the horizontal conveyance section and one to the right angle conveyance section. The entrance gate solenoid (SD1) switches them. The right angle conveyance path is selected when SD1 turns OFF and the horizontal conveyance path is selected when it turns ON.
In the coupling exit mode and the sub tray exit mode, SD1 turns ON and sets the entrance gate to the horizontal conveyance section when the main body print signal turns ON. SD1 turns OFF after the paper exit.

(2) Horizontal conveyance gate control

The horizontal conveyance gate switches the path to the sub tray section and the coupling conveyance path to the succeeding device. The horizontal conveyance gate solenoid (SD3) switches them. The coupling conveyance path is selected when SD3 turns OFF and the sub tray path is selected when it turns ON.

2.3.2 Conveyance line speed switch control

The entrance conveyance motor (M1) and the horizontal conveyance motor (M2) convey them.
M1 and M2 turn ON when the main body start signal [1] turns ON. M1 switches its rotational speed in accordance with the main body line speed [2] when the main body paper exit sensor turns ON [3]¹. Then it switches its rotational speed to high speed [4] to convey the paper when it receives the paper trailing edge signal (when the paper trailing edge passes through the fusing).
^{*1} C6501/C6501P only. For C8000/1200/1200P/1250/1250P/C7000/C7000P/C70hc/C6000, the speed is not switched.

[3] M1 switching to low speed	[4] Main body paper trailing edge signal
-------------------------------	--

2.3.3 Sub tray paper exit control

When exiting the paper to the sub tray, the paper misalignment is prevented by releasing the nipping of the sub tray exit roller by the roller release solenoid /4 (SD4) to nip the paper only at the trailing edge and slowing down the paper by the sub tray exit roller that is rotating in low speed for every paper. The horizontal conveyance sensor /1 (PS2) [1] and the sub tray exit sensor (PS11) [2] detect the paper exited to the sub tray.

[1] Horizontal conveyance sensor /1 (PS2)	[2] Sub tray exit sensor (PS11)
[3] Roller release solenoid (SD4)	[4] Sub tray exit roller

The roller release solenoid /4 (SD4) turns ON [2] to release the nipping of the sub tray exit roller [3] after a specified period of time since the horizontal conveyance sensor /1 (PS2) detects the leading edge of paper [1]. SD4 turns OFF [5] and the subtray exit roller nips the trailing edge of paper [6] after a specified period of time since PS2 detects the trailing edge of paper [4]. This control is conducted for every paper exited to the sub tray.

[1] Detection of the leading edge of paper	[2] SD4 ON
[3] Releasing nip	[4] Detection of the trailing edge of paper
[5] SD4 OFF	[6] Nipping the trailing edge of paper

2.3.4 Sub tray paper full detection control

The sub tray paper full sensor (PS12) detects the sub tray paper full via the actuator.

PS12 turns ON under normal circumstances. The sub tray paper full condition is detected and the sub tray paper full signal is transmitted to the main body when stacked paper presses the actuator and PS12 turns OFF. Then, the main body displays the message on its operation panel.

3. RIGHT ANGLE CONVEYANCE SECTION

3.3 Operation

3.3.1 Paper overlap control

(1) Overlap mechanism

When the folding operation is conducted for more than 1 sheet of paper, they are overlapped in the right angle conveyance section, and then conveyed to the folding section.

The overlap mechanism is the mechanism to overlap the paper in adequate paper conveyance order. The right angle conveyance gate [1] driven by the right angle conveyance gate solenoid (SD2) [7] and the overlap stopper [5] driven by the overlap motor (M13) [3] conduct the operation. The overlap home sensor (PS17) [4] detects the home position of the overlap stopper.

The overlap stopper [5] is positioned at the position where the trailing edge of paper [2] is positioned 20mm under from the right angle conveyance gate [1] in accordance with the paper size when it stands by for the paper.

The paper from the main body is conveyed into between the right-angle conveyance gate [1] and the overlap assist roller [8]. Then the paper is conveyed further by the overlap assist roller [8] driven by the entrance conveyance motor (M1) and stopped by the overlap stopper.

15ant2c011nb

[1]	Right angle conveyance gate	[2]	Position of the trailing edge of paper
[3]	Overlap motor (M13)	[4]	Overlap home sensor (PS17)
[5]	Overlap stopper	[6]	Front side view
[7]	Right angle conveyance gate solenoid (SD2)	[8]	Overlap assist roller

The first stacked sheet of paper [5] is conveyed while the overlap stopper is located at the standby position [4].

Before conveying the second paper, right angle conveyance gate solenoid (SD2) turns ON to move the right angle conveyance gate [6] to the right [7]. At the time, overlap motor (M13) moves the overlap stopper 30mm upward [3]. It transfers the stacked paper to the left-side of the right angle conveyance gate. The right angle conveyance gate is replaced [9] to clear the conveyance path. The subsequent paper [8] passes the right-side of the right angle conveyance gate and the paper is overlapped in adequate order. Then, M13 moves the overlap stopper downward [1].

The same as the second sheet is conducted until all of sheets are stacked.

[5]	1st paper	[6]	Right angle conveyance gate

[7] Movement of the right angle conveyance gate	[8] 2nd paper
[9] Replacement of the right angle conveyance gate	-

(2) Overlap control

(a) Overlap tri-folding mode control

In the overlap tri-folding mode, up to 5 sheets are stacked in the right angle conveyance section and conveyed to the folding section. The overlap tri-folding is available only with paper of 50g/m² to 91g/m² in weight and is unavailable with others.

The overlap motor (M13) turns ON when the main body start signal [1] turns ON and moves the overlap stopper upward to its standby position.

Turning ON the right angle conveyance gate solenoid (SD2) [3] after a specified period of time since the entrance sensor (PS1) detects the trailing edge of the paper, the right angle conveyance gate is switched, M13 moves the paper upward [4], and isolate the paper from the conveyance gate by transferring it to the left-side of the right angle conveyance gate. Turning OFF SD2 [5], the conveyance gate opens and waits for the subsequent paper.

Conveying the subsequent paper through the right-side of the right angle conveyance gate [6] and detecting the trailing edge of paper by the entrance sensor (PS1) [7], M13 descends the overlap stopper down [8]. When the trailing edge of paper passes under the right angle conveyance gate, SD2 turns ON [9] to switch the right angle conveyance gate and M13 moves up the overlap stopper [10] to send the conveyed sheets of paper to the left-side of the right angle conveyance gate. Then, SD2 turns OFF [11] and stands by for the subsequent paper.

The overlap stopper moves down to the standby position and stands by for the 1st paper of the subsequent set [12] after a specified period of time since PS1 detects the trailing edge of last paper of the set.

[1] Main body start signal	[2] Movement to the standby position
[3] Switching the right conveyance gate	[4] Separating paper
[5] Securing conveyance path	[6] Conveyance of the subsequent paper
[7] Trailing edge of the subsequent paper detected	[8] Descent of paper
[9] Switching the right conveyance gate	[10] Separating paper
[11] Securing conveyance path	[12] Movement to the standby position

(b) Center folding/saddle stitching mode control

In the center folding/saddle stitching mode, 1, 2, or 3 sheets of paper are stacked and conveyed to the folding section. The number of the stacked sheets is different depending on its paper weight and the conveyance pattern.

Plain paper (less than 131g/m²): up to 3 sheets are stacked and conveyed to the folding section.

Thick paper (131g/m² or more): due to the limit of the folding performance, up to 2 sheets are stacked and conveyed to the folding section.

- Plain paper

The first 3 sheets of paper of the set are stacked before being conveyed to the folding section. After that, 2 sheets of paper are stacked before being conveyed to the folding section. The number of sheets conveyed together at the last conveyance for that set is one of the followings; 3 sheets (when the total number of sheets is 6 or more even number), 2 sheets (when the total number of sheets is odd) or 1 sheet (when the total number of sheets is 4).

- Thick paper

Up to 2 sheets of paper can be stacked for the thick paper.

For every set, 2 sheets of paper are stacked and conveyed to the folding section at first. Similarly, 2 sheets of paper are stacked and conveyed to the folding section for the subsequent sheets. At the final conveyance, 2 sheets are conveyed (if the total number of the paper is even) or 1 sheet is conveyed (if the number is odd).

- Using PI function

The same as the thick paper control is conducted because the paper type information cannot be obtained in the print job using PI.

3.3.2 Alignment control

(1) Alignment mechanism

The alignment is conducted by driving the alignment claws [2] by the right angle conveyance motor (M6) [5] through the belt [3] and the torque limiter [4].

The alignment claws move to the rear of the shelter direction [7] and stops at the mechanical stoppers [1] through the torque limiter when M6 is rotating toward the paper conveyance direction. Rotating M6 in the reverse direction, the alignment claws push the edge of paper to conduct the alignment [6].

15ant2c013na

[1]	Mechanical stoppers	[2]	Alignment claws
[3]	Belt	[4]	Torque limiter
[5]	Right angle conveyance motor (M6)	[6]	Aligning direction
[7]	Shelter direction	-	

(2) Alignment control

The right angle conveyance motor (M6) rotates in the reverse direction when the main body start signal [1] turns ON and the alignment claws move to the standby position [2] in accordance with the paper size.

No alignment operation is conducted for the 1st paper. M6 rotates in the reverse direction to align paper with the alignment claws [3] after a specified period of time since the entrance sensor (PS1) detects the trailing edge of 2nd paper. Then, M6 rotates in the forward direction to replace the alignment claws to the standby position [4].

M6 rotates to convey the paper to the folding section [6] and evacuate the alignment claws to the home position after a specified period of time after the alignment operation [5] for the last paper of the set. After a specified period of time after the right angle conveyance sensor /2 (PS6) detects the leading edge of paper, M6 rotates in the reverse direction to move the alignment claws to the standby position [7] for the subsequent copy.

15ant2e075na

[3]	Alignment operation	[4]	Return to the standby position
[5]	Alignment operation	[6]	Paper conveyance to the folding section
[7]	Return to the standby position	-	

3.3.3 Right angle conveyance control

(1) Right angle conveyance mechanism

In the right angle conveyance, the right angle conveyance motor (M6) and the roller release solenoids /1 (SD5) [5] and /2 (SD6) [10] convey the paper.

When conveying the paper to the overlap section, the paper falls vertically [6] to the overlap stopper [7] by its own weight after conveyed by the overlap assist roller. At the time, the press by the right angle conveyance roller /1 [3] is released by default since the conveyance direction is not the rotational direction of the right angle conveyance roller /1 [3] but the axial direction of the right angle conveyance roller /1.

After stacking and aligning the specified number of papers, the roller release solenoid /1 (SD5) [5] turns ON to nip the paper and convey the paper to the position rotated 90 degrees from the right side to the front side [8]. The roller release solenoid /3 (SD7) [14] is OFF to release the pressure of the folding entrance roller by default since the upper edge of the paper [1] passes over the folding entrance roller [13].

When conveying the paper from the right angle conveyance section to the folding section [12], the roller release solenoid /2 (SD6) [10] turns ON to release the pressure of the right angle conveyance roller /4 [9] and convey the paper to the folding section by nipping the paper with the folding entrance roller [13].

15ant2c014na

[1]	Upper edge of the paper path	[2]	Entrance sensor (PS1)
[3]	Right angle conveyance roller /1	[4]	Right angle conveyance sensor /1 (PS5)
[5]	Roller release solenoid /1 (SD5)	[6]	Paper conveyance to the overlap section

[11]	Right angle conveyance sensor /2 (PS6)	[12]	Paper conveyance to the folding section
[13]	Folding entrance roller	[14]	Roller release solenoid /3 (SD7)

(2) Conveyance control

The roller release solenoid /1 (SD5) turns ON to press the right angle conveyance roller /1 [2] after a specified period of time since the entrance sensor (PS1) detects the trailing edge of last paper of the set [1]. After the alignment operation [3], the right angle conveyance motor (M6) rotates in the forward direction to convey the paper to the front side [4] by rotating 90 degrees. At this time, the roller release solenoid (SD7) turns OFF a specified period of time after the entrance sensor (PS1) detects the trailing edge of paper and releases the pressure of the folding entrance roller /1 [5].

A specified period of time after the right angle conveyance sensor /2 (PS6) detects the leading edge of paper, SD7 turns ON to pressure the folding entrance roller /1 and nip [6] the upper section of paper that has been conveyed to the front side. Also, a specified period of time after that, when the roller release solenoid /2 (SD6) turns ON [7] to release the right angle conveyance roller /4 and convey the paper to the folding section.

4.3 Operation

4.3.1 Folding entrance conveyance control

(1) Mechanism

The folding entrance motor (M3) and the roller release solenoid /3 (SD7) [5] conduct the folding entrance conveyance operation.

The paper [1] conveyed from the right angle conveyance section is conveyed to the folding entrance with the pressure of the folding entrance roller /1 [7] released. Once the right angle conveyance is completed, SD7 [5] turns ON to pressure the nipping of the folding entrance roller /1 and the roller release solenoid /2 (SD6) [3] turns ON to release the right angle conveyance roller /4, M3 convey the paper to the folding section.

The folding entrance sensor (PS60) [6] detects the paper at the folding entrance.

15ant2c022na

[1]	Paper	[2]	Right angle conveyance roller /4
[3]	Roller release solenoid /2 (SD6)	[4]	Right angle conveyance sensor /2 (PS6)
[5]	Roller release solenoid /3 (SD7)	[6]	Folding entrance sensor (PS60)
[7]	Folding entrance roller /1	-	

(2) Control

The roller release solenoid /3 (SD7) turns ON to nip the paper with the folding entrance roller [2] after a specified period of time since the right angle conveyance sensor /2 (PS6) detects the leading edge of paper [1], and then the roller release solenoid /2 (SD6) turns ON to release the nip of the right angle conveyance roller /4 after a specified period of time. Then the folding entrance motor (M3) turns ON and conveys the paper to the folding section [4].

At the time, the folding transfer motor (M4) rotates in the reverse direction [5] to prevent the paper from being caught between the folding rollers /1 and /2.

SD7 turns OFF to release the pressure of the folding entrance roller [7] after a specified period of time since the entrance sensor (PS1) detects the trailing edge of last paper of the subsequent set [6] and it stands by for the paper of the subsequent set being conveyed to the front side of the right angle conveyance section.

15ant2e078na

[1]	Last paper of the 1st set	[2]	Folding entrance roller nipped
[3]	Nip of the right angle conveyance roller /4 released	[4]	Folding entrance conveyance
[5]	Caught-protection to the folding section	[6]	Last paper of the subsequent set
[7]	Nip of the folding entrance roller released	-	

4.3.2 Folding main scan alignment control

(1) Mechanism

In the folding main scan alignment, the alignment stoppers /Rr [5] driven by the folding main scan alignment motor /Rr (M14) stop at the appropriate position in accordance with the paper size, and then the alignment claws /Fr [2] driven by the folding main scan alignment motor /Fr (M7) conduct the alignment operation. The folding main scan alignment home sensors /Fr1 (PS18) [8] and /Fr2 (PS49) [7] detect the home position of the alignment claws /Fr and the folding main scan alignment home sensor /Rr (PS19) [4] detects the home position of the alignment stopper /Rr.

The alignment claws /Fr [2] convey [6] the paper by pushing its trailing edge once the paper passes through the folding entrance roller /3 [3] and until the leading edge of paper contacts with the alignment stopper /Rr because there is no conveyance roller between the folding entrance conveyance roller /3 [3] and the alignment stopper /Rr [5].

15ant2c023na

[1]	Front side direction	[2]	Alignment claw /Fr
[3]	Folding entrance roller /3	[4]	Folding main scan alignment home sensor /Rr (PS19)
[5]	Alignment stopper /Rr	[6]	Paper conveyance
[7]	Folding main scan alignment home sensor /Fr2 (PS49)	[8]	Folding main scan alignment home sensor /Fr1 (PS18)

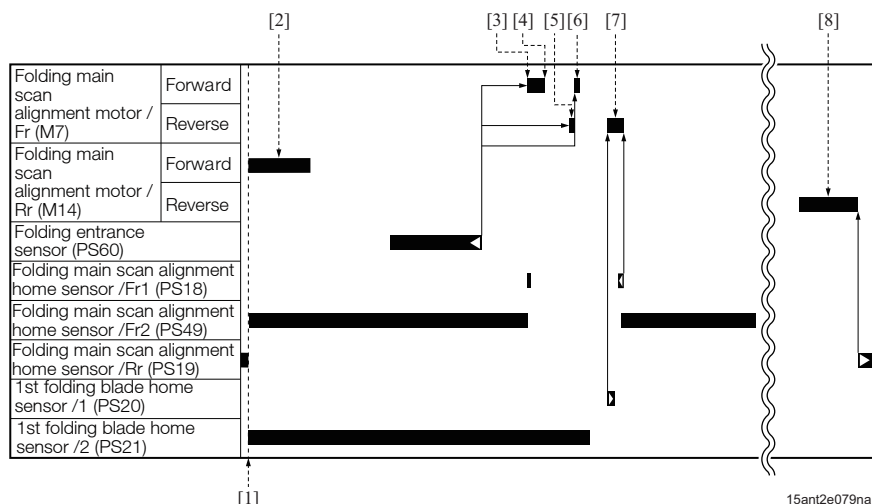

(2) Control

The folding main scan alignment motor /Rr (M14) drives the alignment stoppers /Rr to the appropriate position in accordance with the paper size [2] when the main body start signal [1] turns ON.

The folding main scan alignment motor /Fr (M7) rotates in the forward direction [3] to let the alignment claws /Fr push the trailing edge of paper for conveyance after a specified period of time since the folding entrance sensor (PS60) detects the trailing edge of paper, and then M7 stops after a specified period of time [4]. The alignment stoppers /Rr push the leading edge of paper to conduct the alignment. M7 rotates in the reverse direction [5], and after a specified period of time it rotates in the forward direction to conduct the alignment again [6].

M7 rotates in the reverse direction to replace the alignment claws to the home position [7] when the 1st folding blade home sensor /1 (PS20) detects the completion of the folding operation. M7 starts rotating to replace the alignment claws to the home position for subsequent set when PS21 detects the completion of the folding operation since the 1st folding blade conducts the reciprocal operation in which the 1st folding blade home sensor /1 (PS20) and the 1st folding blade home sensor /2 (PS21) counter changes their positions at each folding operation. M7 stops rotating when the folding main scan alignment home sensor /Fr1 (PS18) detects the home position of the alignment claw /Fr.

Transmitting the print termination signal from SD, M14 rotates to move the alignment stoppers to the home position [8]. It stops rotating when the folding main scan alignment home sensor /Rr (PS19) detects the home position of the alignment stoppers.

4.3.3 Folding control

(1) Mechanism

Folding has the 1st folding and 2nd folding.

The 1st folding is conducted in the overlap tri-folding mode, the overlap tri-folding mode, and the saddle stitching mode.

In the 1st folding operation, the 1st folding blade [7] pushes and inserts the paper between the folding rollers /1 [8] and /2 [3].

The folding rollers /1 and /2 are pressured each other by the spring [2]. The 1st blade motor (M18) [4] drives the 1st folding blade via the crank mechanism [5].

In the 2nd folding operation, as well, the 2nd folding blade [14] pushes and inserts the paper between the folding rollers /2 [3] and /3 [15]. The 2nd folding operation has an adjustable stopper [12] which defines the fold from the 1st folding and accurizes the 2nd folding position.

The folding rollers /2 and /3 are pressured each other by the spring [16]. The 2nd blade motor (M19) [10] drives the 2nd folding blade via the crank mechanism [11].

The folding sensors /2 (PS44) [9], /1 (PS7) [1], and the folding passage sensor (PS8) [13] detect paper.

(2) Tri-folding control

(a) Operation

After the initial operation, the 1st folding blade [8] is at the standby position /1 [5]. In the actuator [7], the 1st folding blade home sensor /2 (PS21) [3] turns ON and the 1st folding blade home sensor /1 (PS20) [6] turns OFF. When paper [9] is conveyed to the folding section and the 1st folding blade motor (M18) is rotated [2], the crank [4] rotates 90 degrees to project the 1st folding blade to the paper and push the paper [12] between the folding roller /1 [10] and /2 [11] with its edge. At the time, the actuator also rotates 90 degrees so that PS21 [3] turns OFF and PS20 [6] turns ON.

M18 keeps rotating in the same direction [13], and then the crank [4] stops when it reaches at the standby position /2 [1] (PS20 turns OFF) where is 180 degrees opposite from the standby position /1. In the 1st folding operation for the subsequent set, M18 rotates in the reverse direction [14] and the crank [4] also rotates 180 degrees in the reverse direction to conduct the 1st folding operation.

The 2nd folding operation is operated as in the 1st folding operation.

15ant2c025na

[1]	Standby position /2	[2]	Projecting position
[3]	1st folding blade home sensor /2 (PS21)	[4]	Crank
[5]	Standby position /1	[6]	1st folding blade home sensor /1 (PS20)
[7]	Actuator	[8]	1st folding blade
[9]	Paper	[10]	Folding roller /1
[11]	Folding roller /2	[12]	Insert paper
[13]	Rotational direction to the standby position /2	[14]	1st folding for the subsequent set

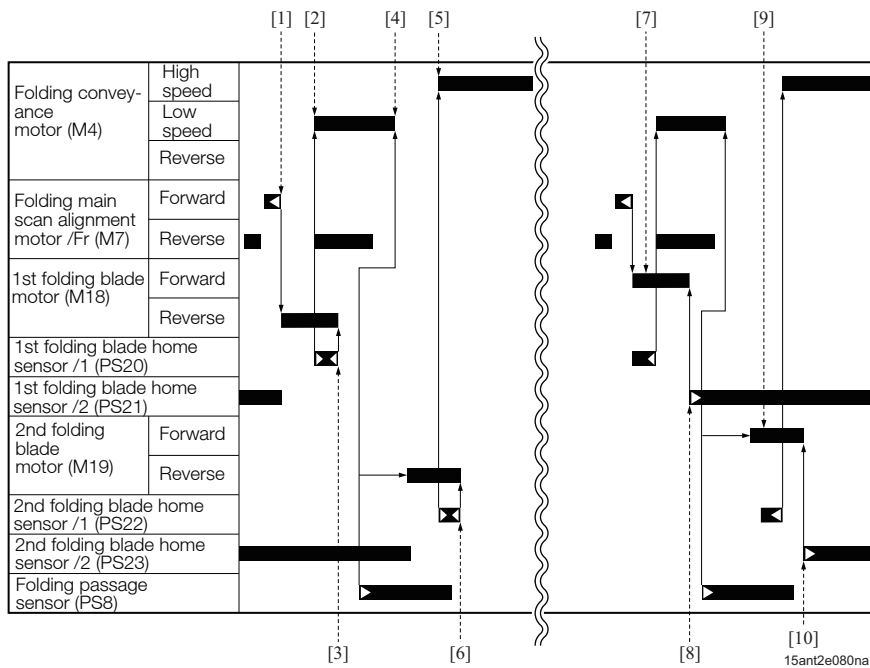

(b) Control

When the folding main scan alignment motor /Fr (M7) stops rotating at the completion of the paper alignment operation, the 1st folding blade motor (M18) turns ON and starts rotating in the reverse direction [1]. The 1st folding blade folds and inserts the paper between the folding rollers /1 and /2. When the 1st folding blade home sensor /1 (PS20) turns ON, the folding transfer motor (M4) turns ON [2] to conduct the 1st folding. M18 stops when PS20 turns OFF [3]. Then, M4 turns OFF and the 1st folding operation is completed [4] after a specified period of time since the folding passage sensor (PS8) detects the leading edge of paper.

After a specified period of time since PS8 turns ON, the 2nd folding blade motor (M19) turns ON and rotates in the reverse direction to start the 2nd folding operation.

When the 2nd folding blade home sensor /1 (PS22) turns ON, M4 rotates [5] in high speed to perform the 2nd folding, and then the tri-folded paper is conveyed to the tri-folding exit. M19 stops when PS22 turns OFF [6].

The 1st folding operation for the subsequent set, M18 rotates in the forward direction to conduct the 1st folding [7] and stops rotating [8] when the 1st folding blade home sensor /2 (PS21) turns ON. In the 2nd folding operation, M19 rotates in the forward direction to conduct the 2nd folding [9] and stops rotating when the 2nd folding blade home sensor /2 (PS23) turns ON [10].

[1] Paper alignment operation completed	[2] 1st folding
[3] 1st folding blade motor (M18) stopped	[4] 1st folding completed
[5] 2nd folding	[6] 2nd folding blade motor (M19) stopped
[7] 1st folding by M18 rotating the forward direction	[8] M18 stopped
[9] 2nd folding by M19 rotating the forward direction	[10] M19 stopped

(3) Tri-folding exit control

(a) Operation

In the multi-letter folding exit, the driving force of the folding transfer motor (M4) is transmitted via the tri-folding exit clutch (CL1). CL1 turns ON and the exit belt [4] is driven approximately 7mm to convey the paper to the front side for every paper exit. The tri-folding paper full sensor (PS10) [3] detects the paper when it is reached at the front, and then the main body displays the message on the operation panel.

[1] Tri-folding exit sensor (PS9)	[2] Right-side view
[3] Tri-folding paper full sensor (PS10)	[4] Paper exit belt

(b) Control

The tri-folding exit clutch (CL1) turns ON and drives the exit belt [1] and stops it [2] after a specified period of time when the tri-folding exit sensor (PS9) detects the leading edge of paper.

The folding transfer motor (M4) stops [3] after a specified period of time since PS9 detects the trailing edge of paper.

[1] Exit belt drive	[2] Exit belt stop
[3] Folding transfer motor (M4) stopped	-

(4) Center folding control

When the folding main scan alignment motor /Fr (M7) stops at the completion of the paper alignment operation, the 1st folding blade motor (M18) turns ON and rotates in the reverse direction [1] to let the 1st folding blade insert the paper between the folding rollers /1 and /2. When the 1st folding blade home sensor /1 (PS20) turns ON, the folding transfer motor (M4) rotates in the reverse direction [2] to rotate the folding rollers /1 and /2 in the reverse direction to release the paper. When PS20 turns OFF, M18 and M4 stop rotating [3].

The folding operation for the subsequent set, M18 rotates in the forward direction to conduct the folding [4] and stops rotating [8] when the 1st folding blade home sensor /2 (PS21) turns ON.

[1]	1st folding blade is projected with the paper	[2]	Folding transfer motor (M18) rotating the reverse direction
[3]	M18 and M4 stopped	[4]	M18 rotating the forward direction
[5]	M18 stopped	-	

4.3.4 Folding sub scan alignment control

(1) Mechanism

The folding sub scan alignment operation is conducted in the multi letter folding mode and is conducted with the folding exit claws [13] and the folding alignment stoppers /Rt [3] driven by the folding sub scan alignment exit motor (M8) [8].

The folding exit claws move to the right [14] and the folding alignment stoppers /Rt move to the left [2] when M8 rotates in the reverse direction [9]. The folding alignment stoppers /Rt are contacted with the alignment stopper [1] and stopped by the torque limiter [7]. The folding exit claws move to the positions for the paper width of A4S or 8 1/2 x 11S and conduct the folding sub scan alignment operation, and then the folding is conducted.

In the multi center folding mode and the saddle stitching mode, M8 rotates in the forward direction to move the folding exit claws to the left [11] after the folding operation. Once the folding exit claws make a round, they conduct the paper exit operation to the saddle stitching section. At the time, the folding alignment stoppers /Rt moving to the right [4] are contacted with the alignment stopper [5] and stopped by the torque limiter [7].

The folding sub scan alignment home sensor (PS56) [12] detects the home position of the folding exit claws in the alignment operation. The folding exit home sensor (PS24) [6] detects the initial position and the center folding exit operation.

[1]	Alignment stopper	[2]	Alignment direction (Left)
[3]	Folding alignment stoppers /Rt	[4]	Movement in the center folding exit operation (Right)
[5]	Home position stopper	[6]	Folding exit home sensor (PS24)
[7]	Torque limiter	[8]	Folding sub scan alignment exit motor (M8)
[9]	M8 rotated in the reverse direction	[10]	Folding sensor /2 (PS44)
[11]	Direction at the center folding exit operation	[12]	Folding sub scan alignment home sensor (PS56)
[13]	Folding exit claws	[14]	Alignment direction (Right)

(2) Folding sub scan alignment control

The folding sub scan alignment exit motor (M8) rotates in the reverse direction to conduct the alignment operation in the sub scan direction [2] after a specified period of time since the right angle conveyance sensor /2 (PS6) detects the trailing edge of paper and the alignment operation in the main scan direction is conducted [1]. When the folding sub scan alignment home sensor (PS56) detects the folding exit claws, M8 conducts the alignment by pressing the side of the paper, and then it stops [3].

The M8 conducts the shelter operation and stops [4] after a specified period of time since PS6 detects the trailing edge of paper.

[1]	Alignment operation in the main scan direction	[2]	Alignment operation in the sub scan direction
[3]	M8 stopped	[4]	Shelter operation

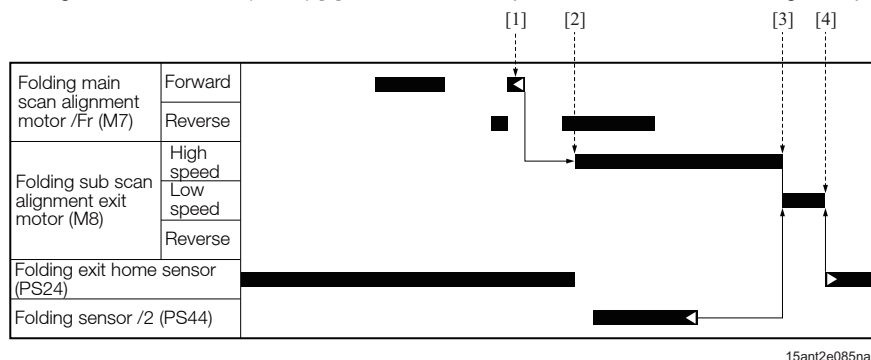

(3) Center folding exit operation

The folding sub scan alignment operation is conducted in the multi-letter folding mode and is conducted with the folding exit claws [13] and the folding alignment stoppers /Rt [3] driven by the folding sub scan alignment exit motor (M8) [8].

The folding exit claws move to the right [14] and the folding alignment stoppers /Rt move to the left [2] when M8 rotates in the reverse direction [9]. The folding alignment stoppers /Rt are contacted with the alignment stopper [1] and stopped by the torque limiter [7]. The folding exit claws move to the positions for the paper width of A4S or 8 1/2 x 11S and conduct the folding sub scan alignment operation, and then the folding is conducted.

In the multi-center folding mode and the saddle stitching mode, M8 rotates in the forward direction to move the folding exit claws to the left [11] after the folding operation. Once the folding exit claws make a round, they conduct the paper exit operation to the saddle stitching section. At the time, the folding alignment stoppers /Rt moving to the right [4] are contacted with the alignment stopper [5] and stopped by the torque limiter [7].

The folding sub scan alignment home sensor (PS56) [12] detects the home position of the folding exit claws in the alignment operation. The folding exit home sensor (PS24) [6] detects the initial position and the center folding exit operation.

[1]	Realignment operation in the main scan direction	[2]	Paper exit operation started
[3]	Switched to the low speed	[4]	Stopped at home position

4.3.5 Guide shaft control

(1) Mechanism

The guide shaft [2] holds the fold line [4] from the bottom and makes certain of the stack [3] in the saddle stitching section when the folding exit claws [7] exit the folded paper [1] to the saddle stitching section.

The guide shaft is projected [5] in sync with the paper exit only when the first folded paper for each set is exited and put away immediately to the folding section [6]. In the subsequent paper exit, the guide shaft does not operate because the paper [3] stacked in the saddle stitching section works as the guide.

15ant2c027na

[1]	Folded paper	[2]	Guide shaft
[3]	Stacked paper	[4]	Fold line
[5]	Projection direction of the guide shaft	[6]	Storage direction of the guide shaft
[7]	Folding exit claws	-	

(2) Guide shaft control

The guide shaft motor (M25) turns ON [2] and the guide shaft is projected after a specified period of time since the folding main scan alignment motor /Fr (M7) completes the realignment operation in the main scan direction [1] (after the center folding operation). The guide shaft conducting the back and forth operation by the belt rotation stops when the guide shaft home sensor (PS46) turns ON [3].

15ant2e086na

[1]	Realignment operation in the main scan direction	[2]	Guide shaft projecting started
[3]	Guide shaft motor (M25) stopped	-	

(3) Folding unit lock control

During the print operation, the folding unit lock solenoid (SD8) locks the folding unit to prevent the guide shaft or the folding exit claws from damage due to pulling out the folding unit by mistake. When the paper gets jammed, the positions of the guide shaft and the folding exit claws are monitored. SD8 turns OFF and releases the lock only when both the folding exit home sensor (PS24) and the guide shaft home sensor (PS46) detect the home position.

5.3 Operation

5.3.1 Saddle stitching alignment control

(1) Mechanism

In the saddle stitching alignment, the saddle stitching alignment plates /Lt [2] and /Rt [8] align the center folded paper [5] in the sub scan direction.

The saddle stitching alignment motor /Lt (M16) [3] drives the saddle stitching alignment plate /Lt [2] in the sub scan direction via the belt by rotating in the forward and reverse directions. The saddle stitching alignment plate /Lt moves to the position for the appropriate paper size when the main body start signal turns ON, and it does not move during the print operation. It return to the position at the saddle stitching alignment home sensor /Lt (PS29) [4] after the print operation.

The saddle stitching alignment motor /Rt (M9) [7] drives the saddle stitching alignment plate /Rt [8] in the sub scan direction via the belt by rotating in the forward and reverse directions. The alignment operation is conducted by M9 by rotating in the forward/reverse directions every time the center folded paper is conveyed. It return to the position at the saddle stitching alignment home sensor /Rt (PS28) [6] after the print operation.

15ant2c037na

[1]	Front side direction	[2]	Saddle stitching alignment plate /Lt
[3]	Saddle stitching alignment motor /Lt (M16)	[4]	Saddle stitching alignment home sensor /Lt (PS29)
[5]	Paper	[6]	Saddle stitching alignment home sensor /Rt (PS28)
[7]	Saddle stitching alignment motor /Rt (M9)	[8]	Saddle stitching alignment plate /Rt

(2) Control

The saddle stitching alignment motor /Lt (M16) rotates in the reverse direction when the main body start signal [1] turns ON and the saddle stitching alignment plate /Lt moves to the position for the appropriate paper size [2].

The saddle stitching alignment motor /Rt (M9) rotates in the forward direction and the saddle stitching alignment plate /Rt conducts the preliminary alignment operation [4] when the folding sensor /2 (PS44) at the exit of the folding section detects the trailing edge of the paper [3]. Then, M9 rotates in the forward direction to conduct the alignment operation [5] when the paper is stacked at the stapler position. After a specified period of time, M9 rotates in the reverse direction to go back the saddle stitching alignment plate to its home position and stands by for the subsequent set [6].

For the last paper of the set [7], M9 rotates in the reverse direction to go back the saddle stitching alignment plate to its home position when the saddle stitching press motor (M21) is completed with holding the paper [8].

15ant2e087na

[1]	Main body print signal	[2]	Moved for appropriate paper size
[3]	Detected the trailing edge of paper	[4]	Preliminary alignment operation
[5]	Alignment operation	[6]	Moved to the home position
[7]	Last paper of the set	[8]	Held the paper with the saddle stitching hold
[9]	Moved to the home position		

5.3.2 Stapler/clinchers movement control

(1) Mechanism

The staplers/clinchers move to the stapling position in accordance with the paper size.

The stapling position is different for every paper size to make the stapling distance half of the paper size.

The staplers /Rt [10] and /Lt [8] are fixed to the belt /Up [9] and the clinchers /Rt [2] and /Lt [4] to the belt /Lw [1]. The stapler movement motor (M15) [5] moves them in the sub scan direction via the connecting shaft [6].

To prevent the tooth skipping of the belts /Up and /Lw at the maintenance, the gear-shaped rotating knob [7] is provided on the connecting shaft [6]. By rotating the knob manually, the staplers /Rt and /Lt and the clinchers /Rt and /Lt move simultaneously.

15ant2c038na

[1] Belt /Lw	[2] Clincher /Rt
[3] Stapler movement home sensor (PS25)	[4] Clincher /Lt
[5] Stapler movement motor (M15)	[6] Connecting shaft
[7] Rotating knob	[8] Stapler /Lt
[9] Belt /Up	[10] Stapler /Rt

(2) Control

The stapler movement motor (M15) rotates in the forward direction when the main body start signal turns ON and moves the staplers and the clinchers to the position for the appropriate paper size. They go back to their home position at the end of the printing operation.

5.3.3 Saddle stitching hold control

(1) Mechanism

The saddle stitching hold is the mechanism to prevent the paper misalignment at stapling. The saddle stitching hold /Up [1] moves down to the saddle stitching hold /Lw [2] at its lower position and hold the center folded paper [3] at the fold line from both up and down. The eccentric cam [5] moves the saddle stitching hold /Up [1] up and down via the arm [6].

15ant2c039na

[1] Saddle stitching hold /Up	[2] Saddle stitching hold /Lw
[3] Center folded paper	[4] Left-side view
[5] Eccentric cam	[6] Arm

The spring [3] enforces the saddle stitching hold /Up [6] toward the saddle stitching hold /Lw [5]. When the saddle stitching press motor (M21) rotates the eccentric cam [2] via the gear [1], the arm [4] moves along with the shape of the eccentric cam and the spring [3] lowers the saddle stitching hold /Up.

The saddle stitching hold /Up [6] holding the center folded paper at its lower position is pushed up to its upper position by the saddle stitching hold /Lw [5] during the stapling operation. This allows the paper to be moved from the lower position to the upper position without any misalignment.

The saddle stitching press home sensor (PS27) [8] detects the home position of the eccentric cam.

[1] Gear	[2] Eccentric cam
[3] Spring	[4] Arm
[5] Saddle stitching hold /Lw	[6] Saddle stitching hold /Up
[7] Front side direction	[8] Saddle stitching hold home sensor (PS27)

(2) Control

(a) Saddle stitching mode

At the end of the paper alignment operation [1], the saddle stitching press motor (M21) rotates to move the saddle stitching hold /Up downward [2] and hold the paper between the saddle stitching holds /Up and /Lw. Then, the clincher up down motor (M20) starts rotating and the saddle stitching hold /Up is pushed up by the saddle stitching hold /Lw while holding the paper [3]. M20 rotates in the reverse direction and lowers the saddle stitching hold /Lw [5] when the clinching operation [4] is started. Also the spring lowers The saddle stitching hold /Up. M21 turns ON and go back the saddle stitching hold /Up to its standby position [6] after a specified period of time since the clinching operation is started.

[1] Alignment operation	[2] Saddle stitching hold /Up moved down
[3] Saddle stitching hold /Lw moved up	[4] Clinching operation
[5] Saddle stitching hold /Lw moved down	[6] Saddle stitching hold /Up moved up

(b) Multi-center folding mode

At the end of the paper alignment operation [1], the saddle stitching press motor (M21) rotates to move the saddle stitching hold /Up downward [2] and stack the paper securely. Then, M21 keeps rotating to move the saddle stitching hold /Up upward to its standby position [3].

[1] Alignment operation	[2] Saddle stitching hold /Up moved down
[3] Saddle stitching hold /Up moved up	-

5.3.4 Clincher up down control

(1) Mechanism

The clincher shelters at the lower position to obtain space between the stapler and the clincher when the paper is conveyed between them.

After the alignment operation, the saddle stitching hold /Up [7] moves down and holds the center folded paper [6]. Then the eccentric cam [4] drives the saddle stitching hold /Lw [2] and the clincher [3] to push up the saddle stitching hold /Up [7] to the position where the stapler [1] is positioned while holding the center folded paper.

15ant2c041na

[1]	Stapler	[2]	Saddle stitching hold /Lw
[3]	Clincher	[4]	Eccentric cam
[5]	Left-side view	[6]	Center folded paper
[7]	Saddle stitching hold /Up	-	

The clincher [7] moves down to the lower position by its own weight and moves upward by the clincher up down motor (M20). The roller [2] attached to the arm [5] is pushed up and the clincher is contacted with the stapler when M20 rotates the eccentric cam [3]. The paper between the clincher and the stapler is held securely by the spring [6]. Once the stapling operation is completed, M20 rotates in the reverse direction to go back the eccentric cam, and then the clincher moves down by its own weight.

15ant2c042na

[1]	Left-side view	[2]	Roller
[3]	Eccentric cam	[4]	Clincher up down home sensor (PS26)
[5]	Arm	[6]	Spring
[7]	Clincher /Rt, /Lt	[8]	Saddle stitching hold /Lw
[9]	Front side direction	-	

(2) Control

The clincher moves up or down only in the saddle stitching mode.

Once the saddle stitching press motor (M21) moves down the saddle stitching hold /Up [1], the clincher up down motor (M20) rotates in the forward direction to move up the clinchers /Rt and /Lt and the saddle stitching hold /Lw [2]. M20 is stopped when the clincher up down home sensor (PS26) turns ON.

M20 rotates in the reverse direction to move down the clinchers /Rt and /Lt and the saddle stitching hold /Lw when the clincher solenoids /Rt (SD9) and /Lt (SD10) starts the clinching operation [4]. They are stopped at the lower position [5] when PS26 turns OFF.

[1]	Saddle stitching hold /Up moving down stopped	[2]	Clinchers /Rt and /Lt moved up
[3]	Clinchers /Rt and /Lt stopped at the upper position	[4]	Clinching operation
[5]	Clinchers /Rt and /Lt stopped at lower position	-	

5.3.5 Stapler control

(1) Mechanism

The stapler motors /Rt (M29) and /Lt (M30) [10] and the clincher solenoids /Rt (SD9) and /Lt (SD10) [5] operate the stapler operation. The stapler home sensors /Rt (HS1) and /Lt (HS3) [8] and the clincher start sensors /Rt (HS2) and /Lt (HS4) [11] detect the stapler operation. HS1, HS2, HS3, and HS4 are hall element sensors and control the position of the magnet [12] of the rotating eccentric cam [9]. M29 and M30 [10] drive the staple bending arm [3] and the stapling arm [2] via the eccentric cam [9]. The staple bending arm bends the rolled staple [6] into the U-shape and the stapling arm staples it toward the clincher. Then the clincher solenoids /Rt (SD9) and /Lt (SD10) bend the staple by driving the clincher plate [4]. The stapling operation is completed with these operations. The staple empty switches /Rt (SW1) and /Lt (SW2) [7] detect whether the staple or cartridge is set or not.

[1]	Front side direction	[2]	Stapling arm
[3]	Staple bending arm	[4]	Clincher plate
[5]	Clincher solenoid /Rt (SD9), /Lt (SD10)	[6]	Staple
[7]	Stapler empty switch /Rt (SW1), /Lt (SW2)	[8]	Stapler home sensor /Rt (HS1), /Lt (HS3)
[9]	Eccentric cam	[10]	Stapler motor /Rt (M29), /Lt (M30)
[11]	Clincher start sensor /Rt (HS2), /Lt (HS4)	[12]	Magnet

(2) Control

(a) Stapler control

The stapler motors /Rt (M29) and /Lt (M30) start the stapling operation [2] when the clincher up down home sensor (PS26) detects that the clinchers /Rt and /Lt are contacted with the stapler assy [1].

The clincher solenoids /Rt (SD9) and /Lt (SD10) bend the staple and the stapling operation is completed when the clincher start sensors /Rt (HS1) and /Lt (HS3) in the stapler assy turn ON [3]. M29 and M30 stop and return to the home position [4] when the stapler home sensors /Rt (HS1) and /Lt (HS3) detects the home position.

(b) Staple and cartridge detection

When the remaining amount of the staple becomes 20 or the cartridge is not set, the staple empty switches /Rt (SW1) and /Lt (SW2) turn ON and the main body displays the message on its operation panel.

5.3.6 Bundle arm control

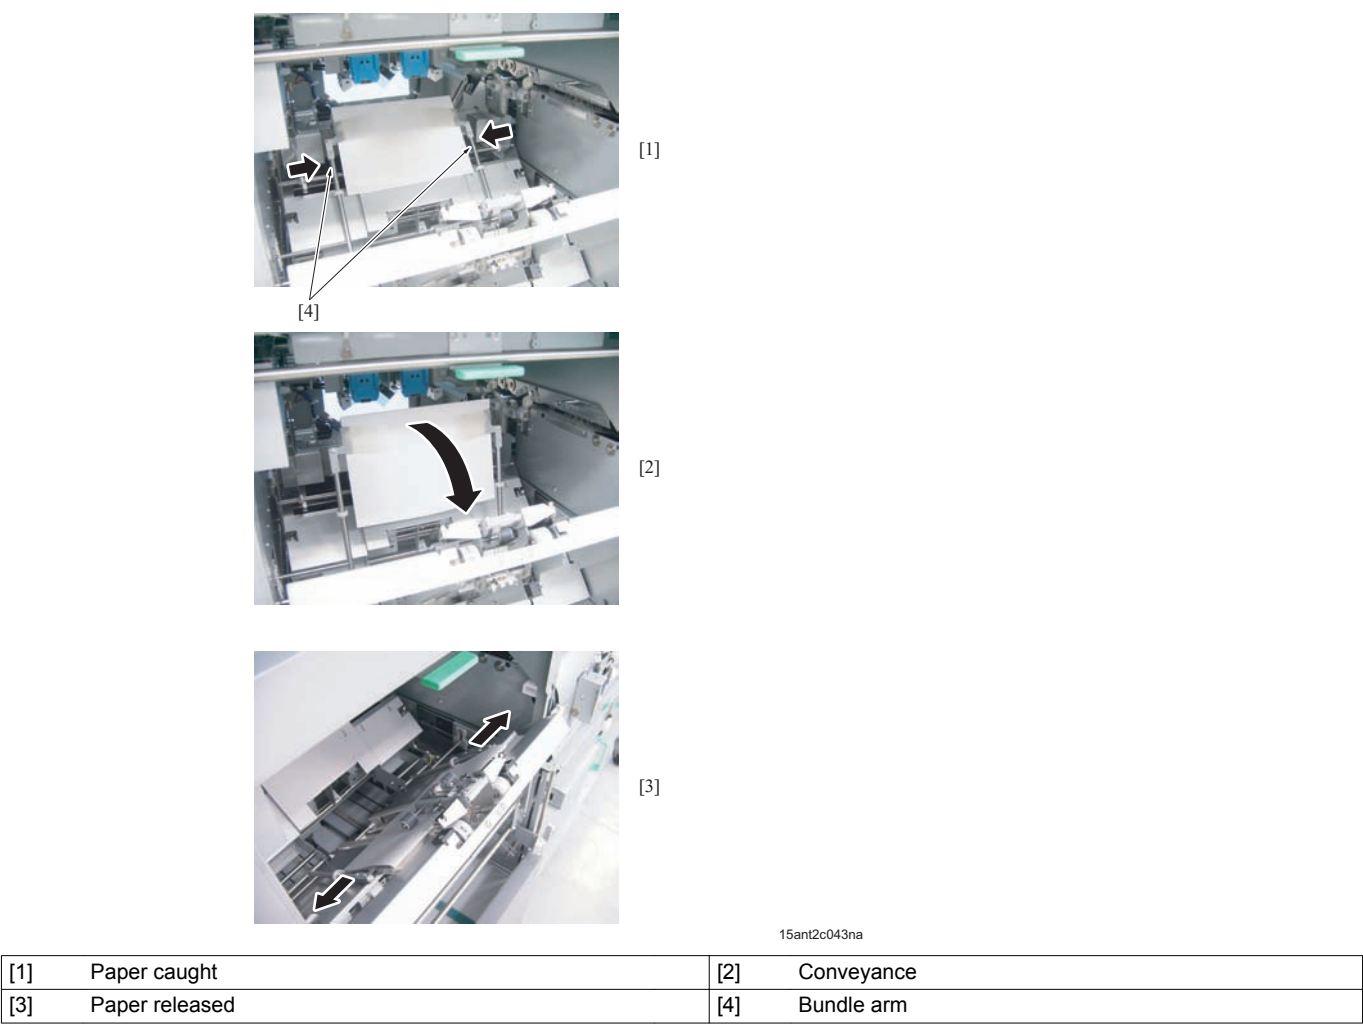

The bundle arm [4] rotates and moves in the sub scan direction.

It rotates to convey the paper from the stapling section to the bundle clip section and moves in the sub scan direction to catch/release the paper.

In the multi center folding mode, the bundle arm rotates to the stapling position after the last paper of the set is conveyed. In the saddle stitching mode, it rotates after the stapling operation.

By moving the bundle arm, the tip of the bundle arm is inserted under the fold line of the paper and the paper is caught [1].

The caught paper is conveyed to the bundle clip section [2] by the rotation of the bundle arm. The bundle arm moves in the outside of the sub scan direction and releases the paper [3] when the bundle clip holds the paper at the folding side.

(1) Bundle arm movement mechanism

The bundle arm motor (M10) [6] drives the bundle arm [5] to catch/release the paper [4] in the sub scan direction via the belt.

The bundle arm home sensor (PS32) [1] detects the home position of the bundle arm.

15ant2c044na

[1]	Bundle arm home sensor (PS32)	[2]	Front side direction
[3]	Guide shaft	[4]	Paper
[5]	Bundle arm	[6]	Bundle arm motor (M10)

(2) Bundle arm rotation mechanism

The bundle arm rotation motor (M22) [2] drives the bundle arm [8] via the belt, slide guide [5], and guide shaft [6]. When M22 drives the slide guide [5] in the main scan direction, the guide shaft [6] passing through the long hole of the slide guide is rotated, and then the bundle arm [8] is rotated around the fulcrum. When it is driven to the paper [3] side, M22 stops where the ring [7] is contacted with the guide plate [4].

The bundle arm rotation home sensor (PS31) [9] detects the home position of the bundle arm.

15ant2c045na

[1]	Front side direction	[2]	Bundle arm rotation motor (M22)
[3]	Paper	[4]	Guide plate
[5]	Slide guide	[6]	Guide shaft
[7]	Ring	[8]	Bundle arm
[9]	Bundle arm rotation home sensor (PS31)	-	

In the rotation drive of the bundle arm [8], the slide guide [5] has to be overrun to be sure to make the ring [7] of the bundle arm contact with the guide plate [4]. To prevent any parts from damage due to the overrun, the guide shaft [3] is movable with the shock absorbing guide [4] and the spring [2].

15ant2c046na

[1]	Front side direction	[2]	Spring
[3]	Guide shaft	[4]	Shock absorbing guide
[5]	Slide guide	[6]	Guide plate
[7]	Ring	[8]	Bundle arm

(3) Bundle arm control

The bundle arm motor (M10) rotates in the reverse direction when the main body start signal [1] turns ON and moves the bundle arm to the appropriate position in accordance with the paper size.

The bundle arm rotation motor (M22) rotates in the forward direction to rotate the bundle arm to the stapling section [3] after a specified period of time since the folding sensor /2 (PS44) detects the trailing edge of paper of the last set. It stops the bundle arm in an upright position [4] when the bundle arm rotation home sensor (PS31) turns OFF.

Then, M22 rotates again [5] to drive the bundle arm until it is contacted with the guide plate on the stapling section [6]. The timing for M22 to restart the rotation [5] is different between in the multi-center folding mode and in the saddle stitching mode. (The picture shows the time chart of the saddle stitching mode)

- Multi center folding mode: When the saddle stitching press home sensor (PS27) detects the saddle stitching hold /Up has been moved to its upper position.
- Saddle stitching mode: After a specified period of time since the clincher up down home sensor (PS26) detects that the clinchers are contacted with the staplers.

M10 inserts the tip of the bundle arm under the fold line of the paper [7] when the bundle arm assist motor (M26) starts the assisting operation by pushing up the trailing edge of paper at the back side and M10 stops after a specified period of time [8].

M22 rotates in the reverse direction to convey the paper to the bundle clip section when M10 stops [8]. It stops after a specified period of time since PS31 turns ON.

M10 rotates in the forward direction to pull out the bundle arm from the paper and take shelter it from the conveyance path [11] after a specified period of time since the bundle clip motor (M11) starts to catch the paper [10]. M10 stops when the bundle arm home sensor (PS32) turns ON [12].

M10 rotates in the reverse direction to go back the bundle arm to its standby position [13] for the subsequent set after a specified period of time since it stops.

[1] Main body start signal	[2] Moved for appropriate paper size

[13] Bundle arm moved for the subsequent set	-

* The picture shows the time chart of the saddle stitching mode

5.3.7 Bundle arm assist control

(1) Mechanism

The bundle arm assist mechanism is the mechanism to assist the paper conveyance of the bundle arm rotation drive to be conducted without fault. It pushes up the fore edge side of the paper [6] with the bundle arm assist plate [4] to tilt it to the front.

The bundle arm assist motor (M26) [2] drives the bundle arm plate [4] via the belt.

The bundle arm assist upper limit sensor (PS39) [1] detects the upper home position and the bundle arm assist home sensor (PS38) [3] detects the lower home position.

The bundle arm assist plate [4] waits at the position 5mm below the fore edge side of the paper during standby. To keep the error to a minimum, the small-size paper (less than 314mm) and the large-size paper (314mm or more) are moved to the standby position from the position of PS39 and PS38 respectively since the driving time of M26 (DC brush motor) positions the standby position for the paper.

In the bundle arm assist operation, the fore edge side of the paper is pushed up 35mm (or until PS39 turns ON).

15ant2c065na

[1] Bundle arm assist upper limit sensor (PS39)	[2] Bundle arm assist motor (M26)
[3] Bundle arm assist home sensor (PS38)	[4] Bundle arm assist plate
[5] Front side direction	[6] Paper

(2) Control

(a) Small-size paper (less than 314mm)

For the small-size paper, the bundle arm assist motor (M26) rotates in the forward direction when the main body start signal [1] turns ON to drive the bundle arm assist plate at the home position to the position at the bundle arm assist upper limit sensor (PS39) [2]. After a specified period of time, M26 rotates in the reverse direction to drive the bundle arm assist plate from the upper limit position to the standby position in accordance with the paper size [3] and stands by for the paper.

Then, M26 rotates in the forward direction to push up the fore edge side of the paper [6] for assisting the bundle arm to be inserted under the fold line of the paper. The operation timing [6] of M26 is different between in the multi center folding mode and in the saddle stitching mode. (The picture shows the time chart of the saddle stitching mode)

- Multi-center folding mode: When the bundle arm is contacted with the guide plate of the stapler section [4] by the bundle arm rotation motor (M22).
- Saddle stitching mode: When the clincher moves downward [5] at the end of the stapling operation.

M26 rotates in the forward direction to assist the bundle arm to convey the paper [7] after a specified period. Then the bundle arm assist plate goes back to the standby position and stands by for the subsequent set [8].

[1]	Main body start signal	[2]	Movement to the upper limit
[3]	Moved for appropriate paper size	[4]	Bundle arm contacted with the guide plate
[5]	Clincher moved down	[6]	Assist of the insertion of the bundle arm
[7]	Assist of the bundle arm conveyance	[8]	Moved for appropriate paper size

* The picture shows the time chart of the saddle stitching mode

(b) Large-size paper (314mm or more)

For the large-size paper, the bundle arm assist motor (M26) rotates in the forward direction when the main body start signal [1] turns ON to drive the bundle arm assist plate to the standby position in accordance with the paper size [2] and stands by for the paper.

The subsequent operation is conducted in the same manner as for the small-size paper.

[1]	Main body start signal	[2]	Moved for appropriate paper size
[3]	Bundle arm contacted with the guide plate	[4]	Clincher moved down
[5]	Assist of the insertion of the bundle arm	[6]	Assist of the bundle arm conveyance
[7]	Moved for appropriate paper size	-	

* The picture shows the time chart of the saddle stitching mode

5.3.8 Bundle clip control

(1) Mechanism

The bundle clip is the mechanism to hold the paper that the bundle arm conveyed to the slope and convey the paper to the bundle press stage with its fore edge side to the trimmer section.

The bundle clip catches, releases, and conveys the paper. It catches the paper at the upper limit position [1], conveys it [2], and then release it at the lower limit position [3].

[1]

[2]

[3]

15ant2c047na

[1] Catching	[2] Conveyance
[3] Releasing	-

The bundle clip motor (M11) [5] drives the bundle clip [1] up [8] and down [7] via the gear and belt. The spring [9] provides the bundle clip the force to catch the paper, and the wire [2] and the winding shaft [3] open the bundle clip to release the paper. The bundle clip upper limit sensor (PS33) [4] detects the upper limit of the bundle clip and the bundle clip lower limit sensor (PS30) [6] detects the lower limit.

15ant2c048na

[1] Clip	[2] Wire
[3] Winding shaft	[4] Bundle clip upper limit sensor (PS33)
[5] Bundle clip motor (M11)	[6] Bundle clip lower limit sensor (PS30)

[7] Down	[8] Up
[9] Spring	-

The bundle clip is closed all the time except when it is located at the upper and lower limit position. When the bundle clip moves up [1], the release roller /Up [6] gets onto [7] the release plate /Up [8]. Then the wire winding shaft [4] rotates [3] and takes up the wire [5] to open the bundle clip.

In the same way, when the bundle clip moves down [2], the release roller /Lw [10] gets onto [12] the release plate /Lw [11] and then the wire winding shaft [4] rotates [9] and takes up the wire [5] to open the bundle clip.

15ant2c049na

[1] Up	[2] Down
[3] Wire winding rotation	[4] Wire winding shaft
[5] Wire	[6] Release roller /Up
[7] Getting over at up	[8] Release plate /Up
[9] Wire winding rotation	[10] Release roller /Lw
[11] Release plate /Lw	[12] Getting over at down

(2) Control

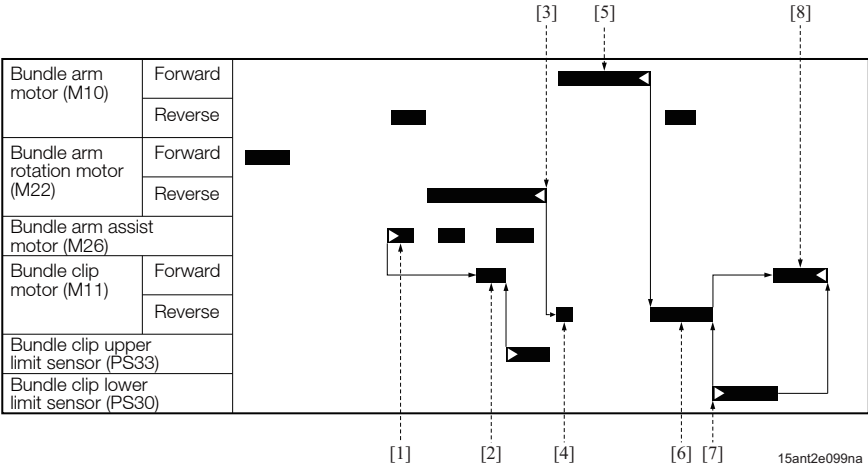

The bundle clip motor (M11) rotates in the forward direction to move up the bundle clip until the bundle clip upper limit sensor (PS33) turns ON [2] after a specified period of time since the bundle assist motor (M26) starts the assisting operation [1]. Then, the bundle clip stops with its clip opened.

The bundle arm conveys the paper from the stapling section to the bundle clip section, and then the bundle arm rotation motor (M22) stops [3]. After a specified period of time, M11 rotates in the reverse direction to move down the bundle clip and close the bundle clip to catch the paper, and then M11 stops after a specified period of time [4].

When the bundle arm motor (M10) completes the shelter operation [5], M11 rotates in the reverse direction to move down the bundle clip [6].

The bundle clip opens the clip to release the paper [7] and M11 stops when the bundle clip lower limit sensor (PS30) turns ON.

M11 rotates in the forward direction to move up the bundle clip after a specified period of time since M11 stops. Then, M11 stops to move the bundle clip at the standby position for the subsequent set after a specified period of time since PS30 turns OFF [8].

6.3 Operation

6.3.1 Bundle press stage up down control

The bundle press stage conducts the up and down operation to convey and exit the paper by the switch back method.

The bundle press stage is moved up [7] to decrease the angle difference when receiving the paper [8] conveyed by the bundle clip from the slope [1]. The bundle press stage exits the paper [5] to the bundle exit tray at the horizontal position [4] at the paper exit.

The bundle registration plate [6] and the bundle exit auxiliary roller [3] move up and down together with the up and down operation of the bundle press stage.

15ant2c057na

[1]	Slope	[2]	Front side direction
[3]	Bundle exit auxiliary roller	[4]	Bundle press stage (horizontal position)
[5]	Paper path at the paper exit	[6]	Bundle registration plate
[7]	Bundle press stage (upper position)	[8]	Paper path to the bundle press stage

The registration claws [3] push in the paper to make sure that the paper is conveyed to the bundle press stage when the bundle press stage [4] receives the paper from the bundle clip [6].

15ant2c061na

[1]	Slope	[2]	Front side direction
[3]	Registration claws	[4]	Bundle press stage
[5]	Paper conveyance	[6]	Bundle clip

(1) Mechanism

The bundle press stage up down motor (M24) [12] rotates the wire winding shaft [14] and winds up the lift wire [3]. During the initial phase, the wire is tightened and the wire arm [4] comes to the horizontal position but the bundle press stage [5] does not move up. At the time, as the wire arm comes horizontal, the bundle registration plate wire [2] is loosened and the bundle registration plate [1] moves down and works as the stopper against the registration operation.

Then, the bundle press stage moves up as the wire winding shaft [14] rotates and winds up the up down wire [3] and it stops when the bundle press stage up down limit sensor (PS45) [11] turns ON.

The bundle registration plate home sensor (PS16) [15] detects the home positions (shelter position) for the bundle registration plate, and the bundle press stage up down home sensor (PS35) [10] detects the home position of the bundle press stage.

The over-winding-prevention stopper [13] prevents the over winding since you can move up and down the bundle press stage manually by rotating the knob [9].

15ant2c056na

[1] Bundle registration plate	[2] Bundle registration plate wire
[3] Lift wire	[4] Wire arm

[15] Bundle registration plate home sensor (PS16)	-

(2) Control

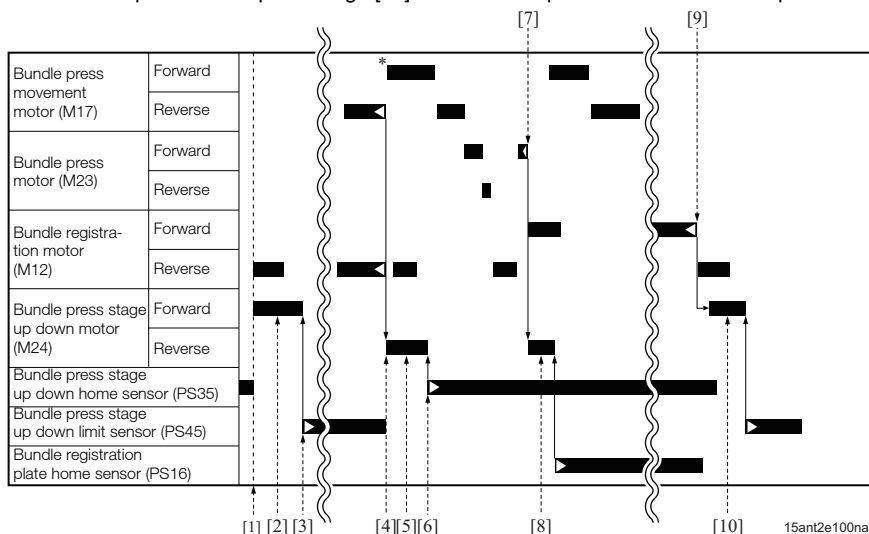

(a) Trimming mode

The bundle press stage up down motor (M24) rotates in the forward direction to move up the bundle press stage [2] when the main body start signal [1] turns ON. M24 stops while holding the bundle press stage in slanting position when the bundle press stage up down limit sensor (PS45) turns ON [3].

M24 rotates in the reverse direction to move down the bundle press stage [5] after the bundle clip releases the paper, the bundle registration motor (M12) assists the paper conveyance operation, and the bundle press movement motor (M17) conveys the paper to the paper conveyance position [4]. M24 stops when the bundle press stage up down home sensor (PS35) turns ON [6].

M24 starts to rotate in the forward direction and moves up the bundle registration plate [8] to open the paper path to the trimmer section when the bundle press motor (M23) completes the paper press operation [7] after the registration operation.

M24 moves up the bundle press stage [10] for the subsequent set when M12 completes the paper exit [9].

[7] Paper exit completed	[8] Bundle press stage moved up

* Only for paper of 297mm or more (before folding)

6.3.2 Bundle press movement control

The bundle press movement is the mechanism to convey the paper to the trimmer section by pressing the paper with the press section to prevent the trimming skew at the trimmer operation after the paper registration operation.

(1) Mechanism

The bundle press movement motor (M17) drives the bundle press section [9] in the main scan direction.

When receiving the paper with the bundle press stage [2], the bundle press section [9] moves 100mm backward from the home position to obtain the paper conveyance path.

When conducting the bundle registration operation, the bundle press section moves to the appropriate position in accordance with the paper size.

The bundle press movement home sensor (PS36) [3] detects the home position of the bundle press section.

When the bundle press section moves to the home position, the metal plate [7] gets down the actuator [6] for the trimmer registration sensor (PS55) [8] and obtains the paper conveyance path.

The bundle sensor /4 (PS54) [10] is for the paper jam detection.

15ant2c058na

[5] Front side direction	[6] Actuator
[7] Metal plate	[8] Trimmer registration sensor (PS55)
[9] Bundle press section	[10] Bundle sensor /4 (PS54)

(2) Control

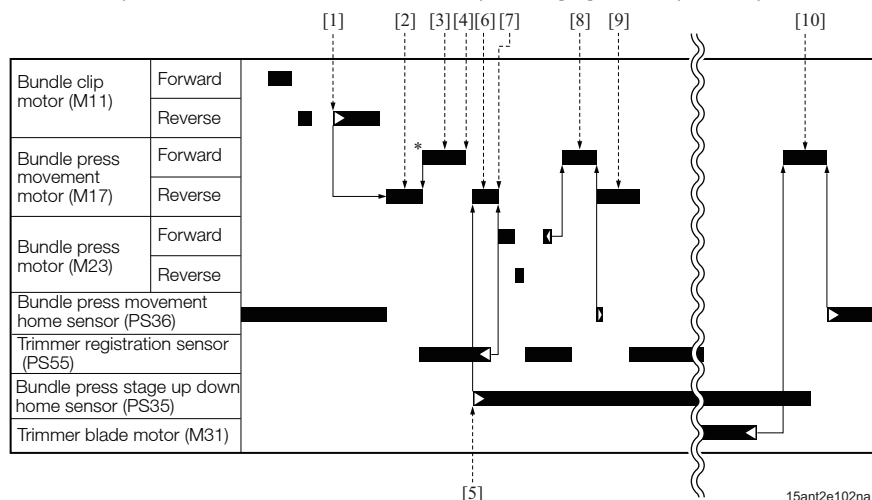

(a) Trimming mode

The bundle press movement motor (M17) rotates in the reverse direction to move the bundle press section to the paper conveyance position [2] after specified period of time since the bundle clip motor (M11) starts conveying the paper [1]. Then M17 rotates in the forward direction to move the bundle press section to the appropriate press standby position in accordance with the paper size [3].

M17 rotates in the reverse direction and searches for the press position [6] for the paper when the bundle press stage up down home sensor (PS35) detects that the bundle press stage has been moved down [5]. M17 stops the bundle press section at the appropriate position in accordance with the paper size [7] after a specified period of time since the trimmer registration sensor (PS55) turns OFF.

M17 searches the home position [8] and then moves the bundle press section to the paper trimming position [9] after a specified period of time since the bundle press motor (M23) completes the paper press operation.

The bundle press section is returned to the home position [10] after a specified period of time since the trimming operation is completed.

[3] Moved to the press position	[4] Bundle press stage up down home position
[5] Returning operation to the home position	-

* Only for paper of 297mm or more (before folding)

6.3.3 Bundle press control

The bundle press is the mechanism to hold the paper during trim operation to prevent the trimming skew after the paper registration operation.

(1) Mechanism

The bundle press plates /Up [1] and /Lw [15] hold the paper. The bundle press plate /Up is pulled to the bundle press plate /Lw [15] (to the direction to hold and press the paper) by the spring [13] via the press wires /Rt [2] and /Lt [12]. The bundle press plate /Up [1] moves down with the force of the spring [13] when the bundle press motor (M23) [5] rotates the wire winding shaft [4] and releases the release wires /Rt [3] and /Lt [6]. The force of the spring presses the paper.

When M23 keeps rotating, the press wire /Lt [6] is loosened and the bundle press lower limit sensor (PS47) [8] turns OFF by the actuator [9] due to the spring [10], and then the paper press position is detected.

The wire winding shaft [4] winds the release wires /Rt [3] and /Lt [6] to move up the bundle press plate /Up [1] for releasing the press the paper [16] when M23 rotates in reverse.

The bundle press home sensor (PS37) [11] detects the home position of the bundle press plate /Up [1].

[1]	Bundle press plate /Up	[2]	Press wire /Rt
[3]	Release wire /Rt	[4]	Wire winding shaft

[13]	Spring	[14]	Bundle press plate /Up (down)
[15]	Bundle press plate /Lw	[16]	Bundle press plate /Up (up)

(2) Control

The bundle press motor (M23) rotates in the forward direction to conduct the paper press operation [2] to press the paper properly when the bundle press movement motor (M17) completes the press position search [1]. M23 rotates in the reverse direction to move up the bundle press plate /Up slightly to prevent the paper from becoming loose [4] when the bundle press lower limit sensor (PS47) detects the lower limit [3] and turns OFF.

M23 rotates in the forward direction to press the paper [5] after a specified period of time since the trimmer registration sensor (PS55) detects the completion of the registration operation.

M23 rotates in the reverse direction to return the bundle press plate /Up to the home position [7] when the trimmer blade motor (M31) completes the paper trimming operation [6].

-----	--	-----	-----------------

[3]	Lower limit detected	[4]	Press release
[5]	Press	[6]	Trimming completed
[7]	Returning to the home position	-	

6.3.4 Bundle registration control

The paper registration operation reforms the skew at trimming.

(1) Mechanism

The bundle registration motor (M12) drives the registration claws [4].

2 registration claws [4] conduct the registration by making the paper [14] contact [3] with the bundle registration plate [13] from the gutter side. In the registration operation, the bundle press section [7] conducts the pressing by moving to the appropriate position in accordance with the paper size. To conduct the bundle registration, the registration claws [4] press the paper until the actuator [2] on the bundle press section comes in the upright position and the trimmer registration sensor (PS55) [1] turns ON.

The bundle exit claws [9] are located at the 180 degrees opposite to the registration claws on the belt. M12 rotates in the reverse direction [10] to exit the paper at the paper exit.

The home position of the registration claws [4] is detected when the registration claws push the actuator [11] and turns ON the bundle registration home sensor (PS34) [12].

[1]	Trimmer registration sensor (PS55)	[2]	Actuator

[11]	Actuator	[12]	Bundle registration home sensor (PS34)
[13]	Bundle registration plate	[14]	Paper

(2) Control

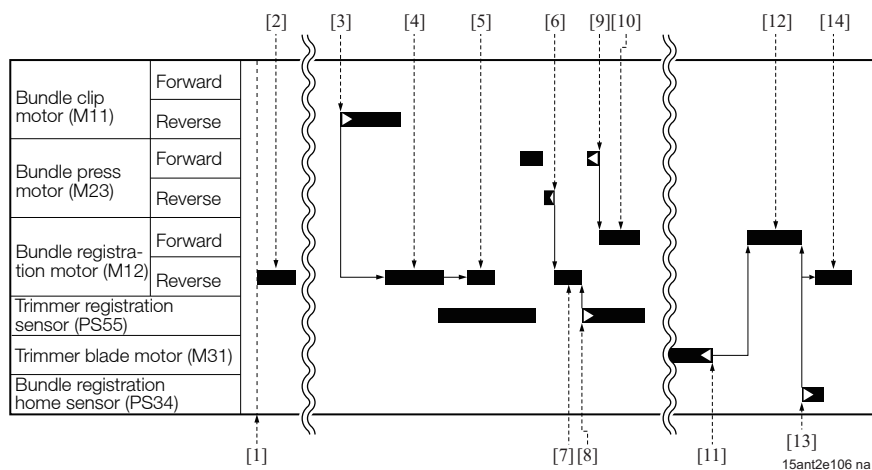

The bundle registration motor (M12) rotates in the reverse direction when the main body start signal turns ON [1] and the registration claws move to the standby position in accordance with the paper size [2].

The bundle registration motor (M12) rotates in the reverse direction to conduct the paper conveyance assisting operation [4] and the pre-registration operation [5] after a specified period of time since the bundle clip motor (M11) starts conveying the paper [3]. Then M12 stops when the registration claws reach at the specified position.

M12 rotates in the reverse direction and conducts the registration operation [7] with the registration claws when the bundle press motor (M23) completes the press releasing operation [6]. The registration claws stop when the trimmer registration sensor (PS55) turns ON [8].

M12 rotates in the forward direction to move the registration claws to the specified shelter position [10] when M23 completes the press operation [9].

M12 rotates in the forward direction to let the bundle exit claws push the paper to conduct the paper exit operation [12] after a specified period of time since the trimmer blade motor (M31) completes the trimming operation [11]. M12 stops when the bundle registration home sensor (PS34) turns ON [13]. M12 rotates in the reverse direction to move the bundle exit claws to the standby position [14] after a specified period of time. Then it stands by for the subsequent set.

[11] Trimming completed	[12] Paper exit operation
[13] Home position detected	[14] Standby position movement

6.3.5 Bundle exit control

(1) Mechanism

(a) Bundle exit mechanism

The paper is exited to the bundle exit tray [12].

The paper exited to the bundle exit tray is conveyed to the front by the bundle exit conveyance belt [1] and stacked.

The bundle exit motor (M5) [5] drives the bundle exit conveyance belt [1] via the bundle exit drive belt [4] and the bundle exit belt drive shaft [3].

M5 drives the bundle exit conveyance belt for a specified period of time to convey the paper to the front [13] for every paper exit. The bundle exit tray is expandable.

The bundle tray set sensor (PS58) [9] detects whether the bundle exit tray is stored or not.

M5 also drives the scrap press plate [11]. In each drive path from M5 to the bundle exit drive belt and the scraps press plate, there is a one-way clutch respectively that switches the rotational direction of M5. Therefore, the bundle exit drive and the scraps press plate are not driven simultaneously.

[1] Bundle exit conveyance belt	[2] Bundle exit auxiliary roller
[3] Bundle exit belt drive shaft	[4] Bundle exit drive belt
[5] Bundle exit motor (M5)	[6] Scraps press home sensor (PS48)

[9] Bundle tray set sensor (PS58)	[10] Trimmer scraps full sensor (PS41)
[11] Scraps press plate	[12] Bundle exit tray

[13]	Front side direction	-
------	----------------------	---

(b) Bundle exit tray expanding mechanism

The bundle exit tray is expandable. The folded bundle exit conveyance belt [6] is also expanded [1] when the bundle exit tray is expanded. At the time, it also moves the bundle exit conveyance belt drive shaft [5] for the bundle exit conveyance belt [1] and [6].

[1]	Bundle exit conveyance belt (expanded)	[2]	Folding stand
[3]	Drive shaft	[4]	Bundle exit drive belt
[5]	Bundle exit conveyance belt drive shaft	[6]	Bundle exit conveyance belt (folded)

(c) Trimmer scraps press mechanism

Trimmer scraps press is executed by driving the bundle exit motor (M5). M[5 drives the pins [10] via the scraps press claws [4] on the belt [5] to move the scraps press plate [2] forward [1], then the plate presses the trimmer scraps. The spring [11] pushes the scraps press plate to put it back.

The trimmer scraps press is carried out when the actuator [8] turns ON the scraps press home sensor (PS48) [9] with the press position [3] of the scraps press plate is at the home position

The maximum displacement of the scraps press plate is 200mm.

The trimmer scraps press is carried out when the trim is performed 5 times or when the total trimmed number of sheets becomes 60 sheets (30 sheets before folding) or more.

[1]	Front side direction	[2]	Scraps press plate
[3]	Press position	[4]	Scraps press claws

[5]	Belt	[6]	Scraps press plate home position (trimming position)
[7]	Backmost position	[8]	Actuator
[9]	Scraps press home sensor (PS48)	[10]	Pin
[11]	Spring		-

(d) Shutter mechanism

When the bundle exit motor (M5) moves the scraps press claw [5] backward and the spring [10] pushes the scraps press plate [2] to its backmost position [4], the shutter arm [6] is pushed up and the shutter [9] is opened. On the other hand, the shutter is closed when the scraps press plate is moved forward from the back most position to the position [3] by the spring of the shutter arm. Opening the shutter allows the guide sheet [7], which is attached to the shutter, to be straightened [8] due to the tension. Closing the shutter allows slack in the guide sheet to widen the dropping path of scraps.

Before trimming, the scraps press plate moves 50mm [3] from the backmost position and stops to be ready for trimming. The shutter repeats opening/closing operation by shuttling the scraps press plate 50mm back and forth in each trimming operation. This shutter operation creates vibration with the guide sheet to shake off the trimmer scraps.

15ant2c117na

[1]	Front side direction	[2]	Scraps press plate

[5]	Scraps press claws	[6]	Shutter arm
[7]	Guide sheet	[8]	Guide sheet (straightened)
[9]	Shutter	[10]	Spring

(2) Trimmer scraps removal control

The scraps removal fan motor (FM1) [3] blows air [4] to make sure to put the trimmer scraps to the scraps box.

15ant2c115na

[1]	Left-side view	[2]	Bundle clip lower limit sensor (PS30)
[3]	Scraps removal fan motor (FM1)	[4]	Air
[5]	Bundle press	[6]	Bundle clip

The trimmer scraps removal fan (FM1) operates only in the trimmer mode.

When the main body start signal [1] turns ON, FM1 is rotated and the bundle clip releases [2] the paper, FM1 stops for a time to prevent the paper from having the uneven edge. When the bundle press motor (M23) completes the paper press [3], FM1 is rotated again to send air so that sheet trimming scraps get in the scraps box without fail.

[1]	Main body start signal	[2]	Bundle clip released the paper
[3]	Paper press operation completed		-

(3) Bundle exit control

The bundle exit motor (M5) rotates in the forward direction and the bundle exit conveyance belt conveys the exit paper [2] after a specified period of time since the trimmer blade motor (M31) completes the trimming [1]. M5 stops after a specified period of time since the bundle exit sensor /2 (PS57) detects the trailing edge of paper [3].

[1]	Trimming completed	[2]	Bundle exit conveyance
[3]	Trailing edge of paper detected		-

[1]

15ant2c114na

[1]	Bundle paper exit sensor /2 (PS57)		-
-----	------------------------------------	--	---

(4) Shutter/trimmer scraps press control

When the trimming is executed with the shutter closed, the bundle exit motor (M5) starts rotating forward to exit paper [1]. Then the scraps press plate moves backward to drop the trimmer scraps with the shutter opened [2]. After a specified period of time since the paper exit is finished [3], the M5 motor rotates in reverse to move the scraps press plate frontward 50mm and stops [4] with the shutter closed. Then the next trimming is excused in this condition.

After a specified period of time from paper exit when the trimming is performed 5 times or when the total trimmed number of sheets becomes 60 sheets or more after the previous scraps press operation [5], the M5 motor starts rotating in reverse to start the press operation [6]. When the press operation is started, the shutter opened by the paper exit operation is closed again [7]. When the scraps press home sensor (PS48) is ON (at the position where pressing trimmer scraps), the M5 motor stops [8] and next operation of the trimming and paper exit [9] is performed.

[1]	Start of paper exit	[2]	Shutter is opened
[3]	Finish of paper ejection	[4]	Shutter is closed

[5] Finish of paper ejection	[6] Start of press operation
[7] Shutter is closed	[8] Press position stop
[9] Paper exit	-

(5) Bundle exit paper full control

The bundle tray paper full sensor (PS61) [1] detects the bundle exit paper full. The main body displays the message on its operation panel when the paper full is detected.

[1]

15ant2c109na

[1] Bundle tray paper full sensor (PS61)	-
--	---

(6) Trimmer scraps full control

The trimmer scraps full sensor (PS41) detects the paper scraps full of the scraps box. When the PS 41 is turned ON for 3 seconds after the paper exit operation driven by the bundle exit motor (M5) is finished, the scraps are detected as full. The main body displays the message on its operation panel when the scrap full is detected.

(7) Trimmer scraps tray set detection

The scraps box set sensor (PS40) detects whether the scraps box is set or not. The main body displays the message on its operation panel when the scraps box is not set.

7.2.4 Paddle drive

7.3 Operation

7.3.1 Trimmer press control

(1) Mechanism

The trimmer press is the mechanism to hold the paper at its fore-edge side to prevent the trimming misalignment. It opens about 6mm at the home position and drives the planetary gears [2] and [11] by the driving of the trimmer press motor (M32) [7]. The output shaft of the planetary gear rotates the press drive screw (trapezoidal screw) [5] and drives the nut [4] up and down. By this operation, the trapezoidal nut drives the trimmer press retaining plate [6] along the shaft [3] and presses paper. M32 detects the completion of the paper press via overcurrent. M32 rotates in the reverse direction to widen the opening to approximately 20mm before conveying the paper to the trimmer section, in case the number of the print paper is 16 or more (32 or more for the saddle stitched paper). The trimmer press home sensor (PS53) [8] and the trimmer press upper limit sensor (PS52) [9] detect the home position and 20mm of opening respectively. The brake solenoid (SD12) [10] drives the trimmer brake [1]. It presses the timing belt from M32 with ON to prevent the inverse rotation caused by the pushing of the trimmer blade.

[1]	Trimmer brake	[2]	Planetary gear
[3]	Slide guide shaft	[4]	Nut
[5]	Press drive screw (trapezoidal screw)	[6]	Trimmer press plate

[9]	Trimmer press upper limit sensor (PS52)	[10]	Brake solenoid (SD12)
[11]	Planetary gear	-	

When changing the trimming position of the trimmer board or replacing the trimmer board via the I/O check mode, M32 rotates in the reverse direction to move up the trimmer press section higher than the position of the trimmer press upper limit sensor (PS52) and release the trimmer board [3] by pushing the shaft [1] of the trimmer board fixing plate [2] to the upper plate. At the time, the opening is approximately 23mm. The position is detected via overcurrent.

[1]	Shaft	[2]	Trimmer board fixing plate
[3]	Trimmer board	-	

(2) Control

(a) The number of the print paper is 16 or more (32 or more for the saddle stitched paper)

The trimmer press motor (M32) rotates in the reverse direction [2] when the bundle clip motor starts conveying the paper [1]. When the trimmer press upper limit sensor (PS52) [3] detects upper limit position of the trimmer board, M32 opens the opening to 20mm and is stopped to wait for the paper.

When the conveyance of the bundle press movement motor (M17) completes [4], M32 rotates in the forward direction to press paper and stops when detecting the over current of M32 [5]. The brake solenoid (SD12) turns ON when M32 stops, and keeps the belt to prevent the trimmer press board from being pushed up by the trimmer blade.

When the trimmer blade motor (M31) completes trimming [6], SD12 turns OFF [7] and M32 rotates in the reverse direction to start opening [8]. When the print is completed, the returning operation to the home position [9] of M32 stops by PS53 ON.

a0h2t2e008ca

[1]	Conveyance by the bundle clip started	[2]	Opening operation
[3]	Stopped when the opening is approx. 20mm	[4]	Conveyance of the trimmed paper completed
[5]	Trimmer press completed	[6]	Trimming completed
[7]	Brake release	[8]	Opening operation started
[9]	Returning operation to the home position	-	

(b) The number of the print paper is 15 or less (30 for the saddle stitched paper)

The trimmer press motor (M32) rotates in the forward direction to press the paper without widening the opening when the paper is conveyed to the opening.

7.3.2 Trimmer blade control

(1) Mechanism

The trimmer blade [3] driven by the trimmer blade motor (M31) [15] conducts the trimming while trimmer press presses the paper.

When the trimmer blade [3] goes up, M31 drives the winding pulley [18] in the direction of winding [17] to wind up the wire [13]. The planetary gears [16] and [19] are between M31 and the winding pulley [18] and it enables the high output by high gear ratio.

Once the wire [13] is wound up, the trimmer blade retaining plate [6] goes up in a slanting direction since the movable pulley is pulled and the guide hole [5] is controlled by the guide shaft [4]. It trims the paper with the trimmer blade [3] attached on the trimmer blade retaining plate [6]. The completion of the trimming is detected when the upper surface of the trimmer blade retaining plate [6] pushes up the actuator [2] and the trimmer completion sensor (PS62) [1] turns ON. When PS62 cannot detect it, the overcurrent of M31 detects the completion of the trimming. If the overcurrent of M31 is not detected even if the trimmer blade keeps moving up, the trimmer blade upper limit sensor (PS51) [9] detects the upper limit.

For moving down the trimmer blade, M31 rotates in the reverse direction to loosen the wire and the spring [7] lowers the trimmer blade retaining plate [6]. The trimmer blade home sensor (PS50) [8] detects the lower limit. The torque limiter is equipped to prevent the wire from being slacking inertially when moving down. Wire slack prevention sensor (PS66) [11] detects the slack of the wire.

- Previous trimmer unit

[15]	Trimmer blade motor (M31)	[16]	Planetary gear
[17]	Winding direction	[18]	Winding pulley
[19]	Planetary gear	-	

(2) Control

The trimmer blade motor (M31) starts trimming when the trimmer press motor (M32) completes the press and stops [1]. M31 stops when the trimming completes with the trimmer completion sensor (PS62) ON [2]. M31 starts the returning operation to the home position [4] when the bundle press motor (M17) starts releasing the press [3]. M31 stops when the trimmer blade home sensor (PS50) turns ON [5].

[1]	Trimming started when trimmer press completed	[2]	Trimming completed
[3]	Paper exit operation started	[4]	Returning operation to the home position
[5]	Home position detected	-	

7.3.3 Trimmer board control

(1) Mechanism

If the trimmer board gets the trimmer blade to the same position many times, the trimmer operation is carried out improperly due to the damage on the board. For this reason, the trimmer board is slid 1mm backward for sheet cutting each time a job of 700 times trimming is completed.

The trimmer board solenoid (SD11) [6] slides the trimmer board [5] to backward with its fixing released by the trimmer press motor (M32). The pinion [3] pushes the feed rack [4] 0.5mm every time SD11 turns ON. The rotation of the pinion [3] is transmitted to the rack by the one-way clutch [2] and pushes the trimmer board when SD2 turns ON. The pinion [3] does not rotate and push the trimmer board when SD11 turns OFF by the one-way clutch.

Each time a job of 700 times trimming is completed, SD11 is turned on twice to move the trimmer board 1mm. The trimmer board can be slid up to approximately 26mm. The main body displays the message on its operation panel when the trimmer board replacement sensor (PS59) [8] is turned ON by the actuator [7]. The trimmer operation is prohibited when the trimming is conducted 700 times since PS59 turns ON.

Note

- The operation timing of the trimmer board solenoid can be selected among 500/300/700 (700 by default), and the travel distance can be selected among 1.0/1.5/2.0mm (1.0 by default) from "Finisher Adjustment" in service mode.
- If 1050, if the DIPSW22-5 setting in service mode is changed to 1, the operation timing of the trimmer board solenoid becomes selectable among 700/500/300 (700 by default) on the adjustment screen in the user mode.
- The burr occurs on the trimmed edge of the paper before the movement cycle of the trimmer board and that depends on the paper type.

[3]	Pinion	[4]	Feed rack
[5]	Trimmer board	[6]	Trimmer board solenoid (SD11)
[7]	Actuator	[8]	Trimmer board replacement sensor (PS59)

(2) Control

The trimmer press motor (M32) starts the returning operation [2] to the home position when the 700th trimmer operation [1] is completed. M32 does not stop by defection of the trimmer press home sensor (PS53) [3]. The opening keeps widening until the overcurrent of M32 is detected [4]. When M32 stops, the trimmer board solenoid (SD11) turns ON/OFF twice [5] to move the trimmer board 1mm. Then, M32 starts the returning operation to the home position [6].

[3]	Home position detected	[4]	Overcurrent of M32 detected
[5]	Trimmer board moved 1mm	[6]	Returning operation to the home position

7.3.4 Trimmer paddle control

(1) Mechanism

The trimmer paddle [2] is provided to prevent the saddle-stitched paper from creating trails with scraps by getting into the paper during the press operation, and to drop the scraps forcibly. The trimmer paddle motor (M33) drives the trimmer paddle.

Trimming amount is 15mm or less: M33 rotates forward [1] to drop [3] the trimming scraps with the trimming paddle. Trimming amount is more than 15mm: The M33 motor rotates in the reverse direction [5] to rake and to drop the scraps to the wider dropping path [4].

a0h2t2c012ca

[1]	Trimmer paddle motor (M33) forward direction	[2]	Trimmer paddle
[3]	Dropping path (Trimming amount is 15mm or less)	[4]	Dropping path (Trimming amount is more than 15mm)
[5]	Trimmer paddle motor (M33) reverse direction	-	

(2) Control

In trimming mode, the trimmer paddle motor (M33) starts forward/reverse rotation after the bundle clip motor (M11) operates paper clipping, and then the M33 motor stops when the trimming JOB is finished.
If the trimming amount value is specified by the "Trimming adjustment" in service mode, the forward/reverse rotation of motor is controlled by the trimming amount that adds the adjusted value. (Edges of standard-sized paper are trimmed by 3mm even when the adjustment value is specified to 0.)

2.3 Operation

2.3.1 Gate control

(1) Entrance gate control

- The entrance gate switches the paper path for the cover paper used for perfect binding so that the paper conveyed from the main body, PI-PFU*¹ or the PI of FD is conveyed to the cover paper table section.
- The entrance gate solenoid (SD1) activates the gate. When the SD1 turns OFF, the gate is opened to convey the cover paper toward the sub tray gate, and when the SD1 turns ON, the gate is changed to make a paper path toward the cover paper table section.
- The SD1 turns OFF while the inside paper for perfect binding is conveyed, relay conveyed, or exited on the sub tray. It turns ON while cover paper is conveyed from the main body, PI-PFU*¹, or PI of FD.

*1 1200/1200P/1250/1250P only.

(a) When cover paper being conveyed from the main body

- When a print job is received, the entrance gate solenoid (SD1) turns OFF [1] to open the entrance gate toward the sub tray gate.
- Cover paper is conveyed through the entrance gate [2].
- When the paper exit sensor of the previous device (main body or post processing machine) detects the leading edge of the cover paper, the SD1 turns ON to switch the entrance gate direction toward the cover table section [4].
- Once a prescribed time period has elapsed after the cover paper entrance sensor (PS3) detects the trailing edge of cover paper [4], the SD1 turns OFF to switch the entrance gate direction toward the sub tray gate for conveying paper to the SC section.

[1] Print start signal ON	[2] Paper conveyance
[3] Cover paper leading edge detection	[4] Cover paper trailing edge detection

(2) Sub tray gate control

- The sub tray gate is provided for switching the path to the SC section which conveys the inside paper for the perfect binding and the relay conveyance paper and the path to the sub tray paper exit.
- The sub tray gate solenoid (SD3) activates the sub tray gate. When the SD3 is OFF, the gate is opened toward the SC section, and when the SD3 becomes ON, the gate direction is switched toward the sub tray to exit inside papers.
- While inside papers are exit on the sub tray, the SD3 turns ON upon receiving a print job, and turns OFF when the job is finished.

(3) Bypass gate control

- The SC section is designed to stack a certain number of inside papers (n) of the subsequent book while the pages of previous book is glued at the clamp section. The bypass gate [3] operates to lay next 2 sheets of inside paper ("n+1"th and "n+2"th) one on top of another and keep them until the stacked "n"th sheet of inside paper at the SC section is conveyed to the clamp section [1]. It saves time for conveying the inside paper and increases productivity.
- The bypass gate solenoid (SD2) activates the bypass gate.
- The bypass gate is not driven in the relay conveyance mode.

---	--------------------------------------

[3] Bypass gate	[4] "n+2"th paper of subsequent book
-----------------	--------------------------------------

(a) Control

1. The bypass gate solenoid (SD2) turns ON when a specified period of time has elapsed after the SC entrance sensor (PS2) detects the trailing edge [1] of the "n+1"th inside paper of subsequent book.
2. The solenoid turns OFF when a prescribed time period has elapsed after the "n+2"th inside paper is laid over the "n+1"th inside paper, and the SC entrance sensor (PS2) detects the trailing edge of the "n+2"th inside paper [2].

[1] Detection of trailing edge of "n+1"th paper of subsequent book	[2] Detection of trailing edge of "n+2"th paper
--	---

2.3.2 Entrance conveyance control

- The entrance conveyance motor (M1) drives the entrance conveyance roller, sub tray conveyance roller, main body cover paper conveyance roller, and the cover paper conveyance roller. The drive force is transmitted via the gear and the timing belt.

(1) Perfect binding mode**(a) When feeding cover paper from the PB cover paper tray**

- The entrance conveyance motor (M1) starts to turn at high speed upon receiving a print job.
- The M1 stops when the JOB is finished.

(b) When feeding cover paper from the main body

1. When detecting that the print start signal turns ON, the entrance conveyance motor (M1) turns ON [1] (starts to turn at high speed).
2. When the main body paper exit sensor is turned ON [4] by the leading edge of the cover paper, the M1 starts to turn at the same speed as the main unit. *1
3. Upon detection of the trailing edge of the cover paper by the main body paper exit sensor, the M1 starts to turn at high speed [5] to convey the paper.

*1 1051/1052 only. The speed of M1 is not switched for C8000/1200/1200P/1250/1250P/C7000/C7000P/C70hc/C6000.

[1] Print start signal ON	[2] Paper
[3] Change of main body process speed	[4] Change to the same speed as the main unit
[5] Change to high speed rotation	-

(2) Sub tray paper exit mode/Relay conveyance mode**(a) Large-size double-sided mode, single-sided main body straight mode (320mm or longer in the sub scan direction)**

1. The entrance conveyance motor (M1) starts to turn at high speed [1] upon receiving a print job, and starts to decelerate [2] in accordance with the main body process speed when the main body exit sensor detects the leading edge of paper. *1
2. After turning OFF the fusing exit sensor, switches M1 to the high speed rotation.

*1 1051/1052 only. The speed of M1 is not switched for C8000/1200/1200P/1250/1250P/C7000/C7000P/C70hc/C6000.

[1] Print start signal ON	[2] Change to the main body process speed
---------------------------	---

(b) Small-size all modes, large-size main body reverse paper exit mode (320mm or shorter in the sub scan direction)

- When detecting that the print start signal turns ON, the entrance conveyance motor (M1) turns ON (starts to turn at high speed).

2.3.3 Intermediate conveyance control

- The intermediate conveyance roller is driven by the drive force of the intermediate conveyance motor (M2) transmitted via the gear and the timing belt.

(1) Perfect binding mode

- The intermediate conveyance motor (M2) starts to rotate when a print job is received.

(2) Sub tray paper exit mode

- The intermediate conveyance motor (M2) does not work.

(3) Relay conveyance mode

- The intermediate conveyance motor (M2) starts to rotate when a print job is received.

2.3.4 Cover paper conveyance control

- The cover paper conveyance section and the cover paper conveyance roller are driven by the drive force of the cover paper feed motor (M74) transmitted via the gear, timing belt, and the coupling.
- The M74 stops when a prescribed time period has elapsed after the cover paper conveyance sensor /4 (PS78) detects the trailing edge of the cover paper.
- For details of the feeding operation, refer to [PN.7. COVER PAPER SUPPLY SECTION](#).

2.3.5 Sub tray paper exit release control

- The sub tray release operation is performed to align edges of papers exit onto the sub tray.
- The sub tray exit solenoid (SD4) activates the operation. The sub tray exit roller separates from the spring when the SD4 becomes On, and the roller moves to push the spring when the SD4 turns Off.

(1) Large-size (320mm or longer in the sub scan direction)

- When a prescribed time period has elapsed after the entrance sensor (PS1) detects the leading edge of paper [1], the sub tray exit solenoid (SD4) turns ON to release the sub tray exit roller from the spring [2].
- The SD4 turns OFF to make the roller push the spring [3] when a prescribed time period has elapsed after the PS1 detects the trailing edge of the paper.

[1]	Paper leading edge detection	[2]	The sub tray exit roller separates from the spring
[3]	The sub tray exit roller pushes against the spring	-	

(2) Small-size (320mm or shorter in the sub scan direction)

- After the entrance sensor (PS1) detects the trailing edge of paper, the sub tray exit solenoid (SD4) turns ON to make the sub tray exit roller separate from the spring [1].
- The SD4 turns OFF to make the roller push the spring [2] when a prescribed time period has elapsed after the PS1 detects the trailing edge of the paper.

[1]	The sub tray exit roller separates from the spring	[2]	The sub tray exit roller pushes against the spring
-----	--	-----	--

2.3.6 Sub tray full-status detection control

- When the sub tray becomes full, the sub tray full sensor (PS5) detects the full-status.

2.3.7 Cover paper multi feed detection control

- When multiple papers are conveyed from the PB cover paper tray at a time, the supersonic sensors; multi-feed detection board /S (MFDBS) [2] and /R (MFDBR) [1] detect the error. The MFDBS transmits a supersonic wave and the MFDBR receives it.

3.3 Operation

3.3.1 SC section operation overview

- The SC section is provided to stack a certain number of paper for subsequent book while papers for the previous book being glued at the clamp section and the glue tank section.
- The number of papers stacked in the SC section varies depending on the print mode and paper size.
- In the relay conveyance mode, the straight gate is driven and the paper is conveyed to the relay conveyance section.

(1) Perfect binding mode overview

1. A page [2] for the first book [3] goes to the SC section and then goes to the clamp section. Once the paper [2] is set in the SC section, the SC stopper [6] is released, and the paper is conveyed to the clamp section by the SC switchback roller [1], SC roller [5] and the clamp entrance roller [4]. All inside papers for the first book are conveyed to the clamp section in this manner one by one.

a15xt2c038ca

[1] Switchback roller	[2] Paper
[3] Page for the first book	[4] Clamp entrance roller
[5] SC roller	[6] SC stopper

2. When the last page of the first book reaches the clamp section, the SC stopper [5] moves back to its original position, and the SC driven roller [2] and the clamp entrance driven roller [3] move away from their paper-feed position. A certain number of papers (n) for the next book are stacked in the SC section by the SC switchback roller [1].

a15xt2c039ca

[1] Switchback roller	[2] SC driven roller
[3] Clamp entrance driven roller	[4] All inside papers for the first book
[5] SC stopper	[6] Page for the next book

3. When binding of the first book is finished, the clamp unit inclines from its upright position to receive paper for the next book. At the same time, the SC stopper [7] moves to open the path, and the SC driven roller [1] and clamp entrance driven roller [5] go into the position to convey the paper (n) [6] stacked in the SC section. During the above operation, the 2nd paper ("n+1"th [4] and "n+2"th [2]) are set in the bypass gate [3].
4. The 2 sheets of paper are conveyed to the clamp section at a time.
5. The rest of the papers for the book are conveyed to the clamp section one by one in the same manner as for the first book.

[7]	SC stopper	-	

(2) Relay conveyance mode

1. The conveyed paper [4] is switched to the path to the relay conveyance section by the straight gate [2] and conveyed to the relay conveyance section one by one by the switchback roller [3] that is in the high pressing mode.

a15xt2c001ca

[1]	Relay conveyance section	[2]	Straight gate
[3]	Switchback roller	[4]	Paper

3.3.2 Gate control of the relay conveyance

- The straight gate solenoid (SD91) drives the straight gate.
- The perfect binding mode keeps SD91 being OFF and does not switch the straight gate.
- In the relay conveyance mode, SD91 turns ON upon receiving a print job and switches the straight gate to the path to the relay conveyance section.

3.3.3 SC entrance conveyance control

- The SC entrance roller is driven by the drive force of the SC entrance conveyance motor (M11) transmitted via the belt.

(1) Control

(a) Perfect binding mode

1. The SC entrance conveyance motor (M11) starts to turn at low speed [1] upon receiving a print job.
2. The M11 speed changes to high speed when the SC entrance sensor (PS2) detects the trailing edge of paper [2].
3. When a prescribed time has elapsed after the M11 acceleration, the M11 returns to low speed [3] before the paper goes through the SC entrance roller.
4. The above conveyance operation is carried out for the last paper of the first book [4] and the first page [5] to the "n"th page [6] of the next book (n=37 to 38 when the papers are A4 sized and one-side printed).
5. The M11 stops to stop the SC entrance roller when the PS2 detects [7] the trailing edge of "n+1"th page.
6. When the PS2 detects [8] "n+2"th paper trailing edge, the M11 starts to turn at high speed [9] to convey the "n+1"th and "n+2"th papers at a time.
7. The rest of the papers for the second book are conveyed in the same manner as for the first book, and the papers for the subsequent books are conveyed in the same manner as for the second book.

[7]	Trailing edge detection of "n+1"th page of second book	[8]	Trailing edge detection of "n+2"th page of second book
[9]	M11 turns at high speed	-	

(b) Relay conveyance mode

1. The SC entrance conveyance motor (M11) starts to turn at high speed upon receiving a print job [1].
2. Once the SC entrance sensor (PS2) detects [2] the leading edge of the 1st sheet, M11 switches to the speed of the main body paper exit.^{*1}

^{*1} 1051/1052 only. The speed of M1 is not switched for C8000/1200/1200P/1250/1250P/C7000/C7000P/C70hc/C6000.

[1]	Print start signal ON	[2]	Paper leading edge detection
-----	-----------------------	-----	------------------------------

3.3.4 SC switchback conveyance control

- The SC switchback conveyance motor (M12) drives the SC switchback roller. The SC switchback release motor (M13) drives the releasing operation of the roller.

(1) SC switchback roller release mechanism

- The SC switchback release motor (M13) drives the pressure cam [3] and the switchback cam [5]. The forward rotation of the motor drives the pressure cam [3] and the reverse rotation of the motor drives the switchback cam [5].
- The SC switchback roller [4] has 3 preset positions for releasing (kept away from the driven roller), pressing strongly or slightly against the driven roller.
- The "pressing strongly" status of the SC switchback roller [4] is used when conveying inside paper to the clamp section and for the relay conveyance, and the roller becomes the "pressing slightly" status when conveying inside paper to the SC section so that the SC stopper stops the papers properly.
- The SC switchback arm pressure detection sensor (PS12) [2] detects the pressure cam position, and the SC switchback spring pressure detection sensor (PS13) [6] detects the position of the switchback cam. The PS12 is ON when the pressure cam is at its home position, and the PS13 is OFF when the switchback cam is at its home position.

PS12	PS13	SC switchback roller status (position)
ON	OFF	Release
OFF	OFF	Press strongly

ON	ON	Press slightly
OFF	ON	Not used ("press strongly" status)

a075t2c032ca

[1]	SC switchback release motor (M13)	[2]	SC switchback arm pressure detection sensor (PS12)
[3]	Pressure cam	[4]	SC switchback roller
[5]	Switchback cam	[6]	SC switchback spring pressure detection sensor (PS13)

(a) Switchback cam drive (light pressure)

- The switchback cam [1] rotates counterclockwise [5] to switch the SC switchback roller [4] position between releasing and light pressing while the pressure cam [3] is at its home position.
- While the SC switchback spring pressure detection sensor (PS13) is OFF, the SC switchback roller is in the release position (kept away from the driven roller).
- When the PS13 is ON [2], the SC switchback roller moves to press slightly against the driven roller.
- The PS13 is kept OFF while the switchback cam is at its home position.

a075t2c033ca

[1]	Switchback cam (home position)	[2]	Switchback cam (press slightly)
[3]	Pressure cam	[4]	SC switchback roller
[5]	Rotating direction of the switchback cam	-	

(b) Pressure cam drive (strong pressure)

- The pressure cam [2] rotates clockwise [4] to switch the SC switchback roller [5] position between releasing and strong pressing. The switch operation of the pressure cam is made while the switchback cam [1] is at its home position.
- While the SC switchback arm pressure detection sensor (PS12) is ON, the SC switchback roller is in the release position (kept away from the driven roller).
- When the PS12 is OFF [3], the SC switchback roller moves to press strongly against the driven roller.

[3]	Pressure cam (PS12 turns OFF)	[4]	Rotation direction of the pressure cam
[5]	SC switchback roller	-	

(2) SC switchback roller control (Perfect binding mode)

- Inside papers of the first book are conveyed to the clamp section one by one without being stacked at the SC section.
- When conveying inside papers to the clamp section without stacking them in the SC section, the SC switchback roller position is switched between releasing and strong pressing. The rotation direction of the roller is also switched between forward and reverse.
- When conveying inside papers of the next and subsequent books, a certain number of papers (n) are first stacked in the SC section, and the stacked inside papers are conveyed to the clamp section at a time. "n+1"th paper and the subsequent papers are conveyed to the clamp section one by one without being stacked at the SC section.
- When stacking papers in the SC section, the SC switchback roller position is switched between releasing and light pressing. During the stacking, the SC switchback roller rotates in the reverse direction.

(a) First book

- The SC switchback conveyance motor (M12) starts to turn in the reverse direction [1] when detecting that the print start signal turns ON. The switchback roller is in its release position to make paper go to the SC section.
- The M12 reverses the direction of rotation (starts to turn in the forward direction) after the SC entrance sensor (PS2) detects the trailing edge of paper [2]. At the same time, the SC switchback release motor (M13) starts to rotate in the forward direction. When the SC switchback arm pressure detection sensor (PS12) turns OFF, the M13 stops and the switchback roller is strongly pressed against the driven roller [4].
- The inside papers are nipped between the switchback roller and the driven roller strongly [4] and conveyed to the SC section by the forward rotation of the roller.
- When a prescribed time has elapsed after the PS2 detects the trailing edge of the paper, the M12 reverses the direction of rotation [5] to convey inside papers to the clamp section.
- When a prescribed time has elapsed after the PS2 detects the trailing edge of the paper, the M13 starts to turn in the forward direction again to move the switchback roller away from the driven roller [6], and when the PS12 turns On, the motor stops.
- The above operations are repeated until the last page [7] of the first book reaches the clamp section.

a075t2e035ca

[1]	Print start signal ON	[2]	Detection of the trailing edge of paper
[3]	M12 forward rotation and strong pressure	[4]	Strong pressure status
[5]	Switchback conveyance start	[6]	Release
[7]	Last page of the first book	-	

(b) The second and subsequent books

- The SC switchback conveyance motor (M12) continues to turn in the reverse direction after the last page [1] of the previous book is conveyed to the clamp section [2].
- When a prescribed time has elapsed after the SC entrance sensor (PS2) detects the trailing edge of the first page of the next book [3], the SC switchback release motor (M13) starts to rotate in the reverse direction [4].

- When the SC switchback spring pressure detection sensor (PS13) turns ON, the M13 stops and the switchback roller is lightly pressed against the driven roller. The inside papers are then conveyed to the SC section and stopped by the SC stopper.
- After the PS2 detects the trailing edge of the paper, the M13 reverses the direction of rotation again. Then the switchback roller is moved away from the driven roller to accept the next page.
- The above operations are repeated until a certain number of papers (n) are stacked in the SC section. (every books)
- While the next 2 papers ("n+1"th page [5] and "n+2"th page [6]) are set in the bypass gate, the stacked n papers are conveyed to the clamp section at a time.
- When the PS2 detects the trailing edge of the "n+2"th page, the M12 starts to turn in the forward direction. At the same time, the M13 also starts to turn in the forward direction to push strongly the switchback roller against the driven roller. After the "n+1"th page and the "n+2"th page are conveyed to the clamp section through the SC section at a time, the following papers are conveyed to the clamp section one by one in the same manner as for the first book.

[3]	Detection of the first page of the next book	[4]	Light pressing start
[5]	"n+1"th page	[6]	"n+2"th page

(3) SC switchback roller control (Relay conveyance mode)

- The SC switchback roller is set to "pressing strongly" and the release operation is not conducted.
 - The SC switchback roller rotates reverse and it conducts the deceleration control to the line speed of the main body paper exit. *1
- *1 1051/1052 only. The speed is not switched for C8000/1200/1200P/1250/1250P/C7000/C7000P/C70hc/C6000.

(a) Control

- The SC switchback conveyance motor (M12) starts to turn in the reverse direction at high speed [1] upon receiving of a print job. At the same time, the SC switchback release motor (M13) starts to rotate in the forward direction.
- When the SC switchback arm pressure detection sensor (PS12) turns OFF, the M13 stops and the switchback roller is strongly pressed against the driven roller [2].
- Once the SC entrance sensor (PS2) detects [3] the leading edge, M12 decelerates [3] to the speed of the main body paper exit.
- Paper is conveyed to the relay conveyance section.

a15xt2e003ca

[1]	Print start signal ON	[2]	Press strongly
[3]	Paper leading edge detection		-

3.3.5 SC main scan alignment control

- The SC alignment motor (M15) drives the SC alignment plates /Fr and /Rr via the belt to move them by 9mm as they are oscillated. This movement aligns the edges of the papers stacked in the SC section in the main scan direction.
- The alignment operation is carried out every time a page is stacked in the SC section when stacking a certain number of papers of the second or subsequent books.
- While inside papers are conveyed to the clamp section without being stacked in the clamp section, this alignment operation is not performed.

(1) Control

- Upon receiving of a print job, the SC alignment motor (M15) starts to turn in the reverse direction to shift the SC alignment plates /Fr and /Rr to the position 9mm outer the paper edges [1].
- After the SC entrance sensor (PS2) detects the trailing edge of the first page of the second or subsequent book, the M15 starts to turn in the reverse direction to carry out the main scan direction alignment with the SC alignment plates /Fr and /Rr.

3. When a prescribed time has elapsed after the PS2 detection, the M15 starts to turn in the forward direction to move the SC alignment plates /Fr and /Rr back to their standby positions.
4. Every time a page is stacked in the SC section, this alignment operation is performed.

Note

- The set positions of the 2 alignment plates (the distance between the 2 plates) can be adjusted in the service mode.

[1]	Print start signal ON	-
-----	-----------------------	---

3.3.6 Sub scan alignment control

- The FD alignment solenoid (SD11) drives the FD alignment plate [4] so that the inside papers [2] are hit against the reference plate [3] of the clamp section to be aligned in the sub scan direction.
- The SC paper detection sensor (PS16) detects the timing of the movement.

[1]	SC paper detection sensor (PS16)	[2]	Paper
[3]	Reference plate	[4]	FD alignment plate

(1) Control

1. When a prescribed time has elapsed after the PS16 detects the trailing edge of the first page of the first book [1], if the clamp alignment plate /Fr and /Rr are closed for alignment operation, the SD11 turns ON.
2. The SD11 turns OFF after a prescribed time has passed since it became ON, and waits for the next page.
3. Until the last page [2] reaches the clamp section, the sub-scan-direction alignment is performed every time a page comes to the section.
4. After the PS16 detects trailing edge of n paper (from the first page to the "n"th page) of the second book [3], the alignment operation is performed.
5. The alignment operation is also carried out for the 2 papers ("n+1"th and "n+2"th page) laid one on top of another at the bypass gate.

[1]	Paper trailing edge detection by PS16	[2]	Last page of the first book
[3]	Paper set		-

3.3.7 SC paper bundle conveyance control

- The SC bundle conveyance motor (M17) [9] drives the SC roller and the clamp entrance roller.
- The SC roller release motor (M18) [5] drives the SC driven roller [7] via the cam [8] to move the roller away from (release) or contact with (press) the opposite roller.
- The SC roller release sensor (PS17) [6] detects the press/release operation of the roller. While the roller is pressed against the opposite roller, the PS17 is kept ON.
- The clamp entrance roller release motor (M20) [1] drives the cam [3] and the clamp entrance roller [4] to move them away from (release) or contact with (press) the opposite roller.
- The clamp entrance roller release sensor (PS19) [2] detects the press/release operation of the roller. While the roller and the cam are in the pressed status, the PS19 is kept ON.

[7]	SC driven roller	[8]	Cam
[9]	SC bundle conveyance motor (M17)	-	

(1) Control

- Upon receiving of a print job, the SC bundle conveyance motor (M17) starts to rotate [1], and the inside paper are conveyed to the clamp section one by one with the SC roller and the clamp entrance roller.
- When the SC paper detection sensor (PS16) detects the trailing edge of the last paper [2], the SC roller release motor (M18) starts to rotate to start stacking paper in the SC section. When a prescribed time has elapsed after the M18 starts to rotate, the M17 stops to stop conveying paper to the clamp section. The clamp entrance roller release motor (M20) also starts to rotate to release the clamp entrance roller [3].
- The M18 stops when the PS17 becomes OFF, and the M20 stops when the PS19 becomes OFF. The next bundle of paper is kept stacked in the SC section until the clamp section is ready for them.
- The M18 turns ON and starts to rotate again [5] after a specified period of time after the SC entrance sensor (PS2) detects [4] the trailing edge of the last page of the stacked paper in the SC section.
- When the pressing of the SC roller is finished after the PS17 turns ON, the M17 turns ON and starts to convey the stacked paper.
- When the leading edges of the paper go through the clamp entrance, the M20 starts to rotate to convey the paper to the clamp section.
- Then the next 2 pages set in the bypass gate are conveyed to the clamp section at a time. All the above operations are repeated for the subsequent books.

[3]	Clamp entrance roller moves away from the paper conveyance position	[4]	Trailing edge of "n'th" page detection
[5]	The SC roller is set in the position for paper conveyance	-	

3.3.8 Clamp entrance movement control

- The clamp entrance movement motor (M19) drives the clamp entrance assy [4] via the belt.
- The clamp entrance assy consists of the clamp entrance roller [2], FD alignment plate [3], SC pressure arm [1], and the SC paper detection sensor (PS16) [5].
- The clamp entrance assy movement moves the FD alignment plate in accordance with the paper size.

a075t2c042ca

[1]	SC pressure arm	[2]	Clamp entrance roller
[3]	FD alignment plate	[4]	Clamp entrance assy
[5]	SC paper detection sensor (PS16)		-

(1) Control

- When the clamp rotation pressure sensor (PS25) turns ON [1] and the clamp section is set at the compiling position, the clamp entrance movement motor (M19) reverses its rotation direction to lower the clamp assy. The motor stops [2] when the clamp assy is set at the position corresponding to the paper size, and the clamp assy becomes ready for accepting the next paper.
- When the clamp motor (M22) initiates clamping operation [3], the M19 starts to turn in the forward direction to lift the clamp entrance assy until the assy reaches the position out of way of the clamping operation. The clamp entrance movement HP sensor (PS18) detects that the assy reaches the position (the sensor becomes ON, and the M19 is stopped [5].
- The above operations are repeated for each book.

[1]	Clamp section is set at the compiling position	[2]	Movement of clamp entrance assy in accordance with paper size
[3]	Clamping starts	[4]	Clamp entrance assy home position

3.3.9 SC stopper control

- In order to stack paper in the SC section, the SC stopper is activated by the SC stopper solenoid (SD12) and closes the paper feed path toward the clamp section.

(1) Control

- When detecting that the print start signal turns ON [1], the SC stopper solenoid (SD12) turns ON to release the SC stopper.
- When the SC paper detection sensor (PS16) detects the trailing edge of the last page of each book, the SD12 turns OFF to set the SC stopper to close the path [2].
- When the SC roller release sensor (PS17) becomes ON and the SC roller holds down a bundle of paper, the SD12 turns ON to move the SC stopper out of the path [3].

a075t2e044ca

[1]	Print start signal ON	[2]	Set SC stopper
[3]	Move SC stopper out of the paper path		-

3.3.10 SC pressure arm control

- The SC pressure arm [2] presses paper [3] conveyed from the SC section to stack paper neatly in the clamp section. The SC pressure arm assists to stack paper to the clamp section.
- The SC paper detection sensor (PS16) [1] detects the timing of the movement.

[1]	SC paper detection sensor (PS16)	[2]	SC pressure arm
[3]	Paper		-

(1) Control

- 1. When a prescribed time has elapsed after the SC paper detection sensor (PS16) detects the paper trailing edge [1], the SC pressure arm solenoid (SD13) turns ON to make the SC pressure arm press paper [2].
- 2. The SD13 becomes OFF to move the SC pressure arm back to its original position [3] after a prescribed time has passed since the PS2 detected the trailing edge of the paper.
- 3. The above operations are also performed when a bundle of paper [4] or 2 sheets of paper [5] are conveyed to the clamp section.

[3]	Clamp alignment plate /Fr	[4]	Clamp alignment motor (M21)

4.3 Operation

4.3.1 Clamp alignment control

- In order to line up edges of paper stacked in the clamp section in the main scan direction, the clamp alignment motor (M21) drives the clamp alignment plates /Fr and /Rr via the belt.
- The main-scan-direction alignment operation is performed when the following paper are set in the clamp section; all inside paper of the first book, "n"paper of the subsequent books stacked in the SC section, the next 2 pages ("n+1"th and "n+2"th paper) of the subsequent books, and "n+3"th and the subsequent page.

(1) Control

1. Upon receiving a print job, the clamp alignment motor (M21) starts to turn in the reverse direction to shift the clamp alignment plates /Fr and /Rr offset 9mm from the paper edges [1].
2. When a prescribed time has elapsed after the SC paper detection sensor (PS16) detects [2] the trailing edge of the first page of the first book, the M21 starts reverse rotation again to perform the main-scan-direction alignment [3] with the clamp alignment plates /Fr and /Rr.

3. Then, while the FD alignment solenoid (SD11) turns ON and paper edges in the sub scan direction are lined up [4], the M21 turns in the forward direction to move the clamp alignment plates /Fr and /Rr away from the paper [5].
4. The SD11 is kept ON until the sub-scan-direction alignment for the last page of the first book [6] is finished. When the SD11 turns OFF and the pressure toward the papers is released, the M21 starts to turn in the reverse direction to press the bundle of paper from its front and back sides [8].
5. When the clamp pressure sensor (PS23) turns ON and clamping the paper is finished, the M21 starts to turn in the forward direction to release the paper [9].
6. After a prescribed time has passed since the PS16 detects the trailing edge of the "n"th paper [10] stacked in the SC section, the alignment operations are performed.
7. The alignment operation is also carried out for the 2 sheets of paper ("n+1"th and "n+2"th page) laid one on top of another [11] at the bypass gate.

[9]	A bundle of "n"paper	[10]	2 sheets of paper

4.3.2 Clamp control

- The clamp fixing plate and the clamp pressure plate clamp a bundle of paper stacked in the clamp section.

(1) Mechanism

1. The gap between the clamp fixing plate [7] and the clamp pressure plate [1] is 45mm when the clamp HP sensor (PS22) [6] is ON [2].
2. Before applying pressure by the clamp motor (M22), the pressure drive plate [5] is move to the left side.
3. The clamp pressure plate moves together with the pressure drive plate [5].
4. When the clamp pressure sensor (PS23) [4] becomes ON after applying pressure to the papers, the clamping operation is finished [3].

a075t2c052ca

[1]	Clamp pressure plate	[2]	Home position
[3]	Finish of clamping	[4]	Clamp pressure sensor (PS23)

[5] Pressure drive plate	[6] Clamp HP sensor (PS22)
[7] Clamp fixing plate	-

(2) Control

- When alignment of the last page is finished [1] by the clamp alignment motor (M21), the clamp motor (M22) starts to turn in the reverse direction to close the clamp pressure plate.
- Upon completion of clamping, the clamp pressure sensor (PS23) turns ON and the M22 stops [2].
- After the spine edges of the compressed inside paper is evened up, the cover paper table up down motors /Fr (M46) and /Rr (M47) lift the cover paper table, and the M22 starts to turn in the forward direction. Then, the clamp pressure plate opening operation is started [3].
- M22 stops when the clamp home sensor (PS22) becomes ON.

[1] Start to close of the clamp pressure plate	[2] Completion of clamping
[3] Start to open	[4] Returning to the home position

4.3.3 Clamp rotation control

- A bundle of inside papers of a book is clamped and rotated to be glued on its spine.

(1) Clamp assy angle change /fixing mechanism

- The drive force of the clamp rotation motor (M23) rotates the clamp rotation assy.
- There are 3 preset tilt angles of the clamp rotation assy as following.

Home position	45 degrees
Clamped	50 degrees
Glue applied	90 degrees

(a) Angle change mechanism

- The tilt angle of the clamp assy is changed for clamping and gluing as following.
- When the clamp rotation assy is in its home position and the clamp pressure plate [7] is also in its home position [3], the tab [6] of the pressure plate presses [2] the release cover [4], and the pin [1] of the switch arm [12] is inserted in the clamp angle stopper notch [11] to stop the rotation of the clamp rotation assy at the angle for clamping.
- When the clamp rotation assy is in its home position, and the clamp pressure plate is not [5], the switch arm drops by its own weight as the tab of the clamp pressure plate is not pressing the release cover. For this reason, the switch arm pin is not inserted in the clamp angle stopper notch, and the clamp rotation assy keeps rotating until the glue angle stopper notch [10] is inserted over the shaft [8] [9].
- The tilt angle of the clamp assy cannot be changed directly between the clamping angle and the gluing angle. To change the angle, the assy first must go back to the home position to release the stoppers.

[1]	Pin	[2]	Release
[3]	Clamp pressure plate is at its home position	[4]	Release bar
[5]	Clamp pressure plate is out of its home position	[6]	Tab of the clamp pressure plate
[7]	Clamp pressure plate	[8]	Regulation shaft
[9]	Engaging of notch and shaft to stop at glueing angle	[10]	Glueing angle stopper notch
[11]	Clamping angle stopper notch	[12]	Switch arm

(b) Fixing of the clamp rotation assy

- While clamping or glueing is performed, the corresponding stopper locks the clamp rotation assy. Moreover, in order to reinforce the fixing state of the assy, the clamp rotation motor (M23) [5] rotates the gear [1] 10 degrees [2] to pull the spring [4] applying the spring load to the assy. The operations fix the clamp rotation assy securely.
- The clamp rotation pressure sensor (PS25) detects that the prescribed pressure is applied to the clamp rotation assy and becomes ON.

[1]	Gear	[2]	Gear rotates 10 degrees to apply spring load to the assy
[3]	Clamp rotation pressure sensor (PS25)	[4]	Spring
[5]	Clamp rotation motor (M23)	-	

(2) Reference plate opening/closing mechanism

(a) Opening/closing of the reference plate

- The reference plate [5] opens/closes in synchronization with the rotation of the clamp rotation assy [1].

1. When the clamp rotation assy stops at the angle for glueing, the release arm [8] presses down the reference plate mounting bracket [6], and the reference plate is separated from a bundle of inside papers. The separation of the reference plate prevents the plate from damaging the paper edges when the clamp rotation assy is upstanding.
2. Further rotation [3] of the reference plate mounting bracket [6] makes the pin [7] go down [2], and the reference plate is released [4] from the spring [9].
3. The reference plate goes back to its home position with the reference mounting bracket [6] which pushes up the pin [7].
4. While clamping operation is in progress, the reference plate is fixed at the upper position with the spring [10].
5. When the clamp pressure plate returns to its home position, the release arm [8] is pushed up by the tab [11] of the clamp pressure plate and moved back to its standby position.

[1]	Clamp rotation assy	[2]	Pin of the reference plate goes down
[3]	Rotation of the reference plate mounting bracket	[4]	Release of the reference plate
[5]	Reference plate	[6]	Reference plate mounting bracket
[7]	Pin	[8]	Release arm
[9]	Spring (for release)	[10]	Spring (for applying pressure)
[11]	Tab of the clamp pressure plate	[12]	Pin

(b) Paper guard tabs mechanism for clamping

- The reference plate [6] has paper guard tabs [2] to prevent inside papers [4] from going off the reference plate while they are clamped [1].
- While the reference plate contacts with the stopper, the paper guard tabs are protruding.
- When the reference plate is opened [3], the paper guard tabs are retracted [5] so as not to damage the paper edges.

[1]	Clamped	[2]	Paper guard tabs
[3]	When the reference plate is opened	[4]	Inside paper
[5]	Paper guard tabs retracted	[6]	Reference plate

(3) Control

1. When detecting that the print start signal turns ON [1], the clamp rotation motor (M23) starts to turn in the reverse direction.
2. The M23 stops when the clamp rotation pressure sensor (PS25) becomes ON, and the clamp rotation assy is set at the compiling position [2].
3. When clamping of the inside papers by the clamp motor (M22) is finished [3], the M23 starts to turn in the forward direction to rotate the clamp rotation assy 15 degrees counterclockwise.
4. The M23 stops [4] when the clamp rotation home sensor (PS24) becomes ON. The tilt angle of the gear is 15 degrees when the assy returns to the home position, however, the clamp rotation assy rotates 5 degrees as the gear has rotated 10 degrees more separately for fixing the assy. As the result, the clamp rotation assy tilt angle changes from 50 degrees for clamping to 45 degrees (home position). At this time, since the clamp pressure plate is out of the home position, the pin is free from the clamp angle stopper notch, which allows the clamp rotation assy to rotate to the gluing angle.
5. After a prescribed time has elapsed, the M23 starts to turn in the reverse direction to rotate the clamp rotation assy clockwise [5].
6. When the PS25 turns ON, the spring fixes the assy, and the M23 stops [6]. At this time, the gear has rotated 55 degrees, however, in order to secure the assy, it has rotated 10 degrees more than the clamp rotation assy, the clamp rotation assy rotates 45 degrees clockwise from its home position and becomes upright state (90 degrees).
7. When the clamp paper sensor (PS28) detects [7] that the bundle of paper is released from the clamp, the M23 starts to turn in the forward direction to return the clamp rotation assy to the home position.
8. The M23 stops [8] when the PS24 becomes ON, and the clamp rotation assy stops at its home position (tilt angle of 45 degrees). At this time, since the clamp pressure plate is in the home position, the pin is engaged with the clamp angle stopper notch, which allows the clamp rotation assy to rotate to the clamping angle.
9. Then, the M23 starts to turn in the reverse direction [9] to move the clamp rotation assy to the clamping position [10] and stops when the PS25 becomes ON.

[1]	Print start signal ON	[2]	Set at the compiling position
[3]	Completion of clamp	[4]	M23 stopped
[5]	M23 starts to apply pressure	[6]	Upright state completion
[7]	Paper release	[8]	Home position
[9]	M23 starts to apply pressure	[10]	Clamp position

4.3.4 Book thickness detection control

- The booklet thickness sensor (PS29) detects the book thickness.
- The detected thickness is used to determine the trimming amount of the cover paper.

(1) Mechanism

- The clamp pressure plate [1] is moved by winding up the wire[6].
- When the wire [6] is wound up, the encoder plate [4] rotates.
- The booklet thickness sensor (PS29) [5] detects and counts how much the encoder scale is rotated.
- The sensor continue the counting until the clamp pressure sensor (PS23) [2] turns ON.

[1]	Clamp pressure plate	[2]	Clamp pressure sensor (PS23)
[3]	Clamp HP sensor (PS22)	[4]	Encoder scale
[5]	Booklet thickness sensor (PS29)	[6]	Wire

(2) Control

1. When the clamp home sensor (PS22) switches to ON from OFF, pulse count by the booklet thickness sensor (PS29) is started [1].
2. The pulse count is stopped [2] when the clamp pressure sensor (PS23) turns ON.
3. During the initial operation at power-ON, the no paper status data is detected and memorized as an initial data. The book thickness is determined according to the difference.

[3] Pellet supply arm	[4] Pellet supply arm motor (M34)

5.3 Operation

5.3.1 Pellet supply operation overview

- The pellet supply arm [3] is moved above the glue tank [4] to supply pellets [2]. Next, it moves up the pellet supply pipe and scoop the fixed amount of pellet with the fixed measure [7] on the top. Then, it opens the measure bottom plate [1] and the pellet supply pipe shutter [6] to drop the pellet.
- The glue tank temperature sensor /Up (TH2) provided in the glue tank unit determines the timing to supply pellets into the glue tank. As the molten glue inside the glue tank decreases, the TH2 surface not soaked in the glue becomes wider. It finally causes the TH2 temperature lower than a prescribed level, and it is judged that the glue is getting low and another pellets must be supplied.
- Checking the TH2 temperature is carried out in the following timing.
 - a. When the glue tank HP sensor (PS33) turns ON after gluing operation.
- The interval of the pellet supply changes since the amount of glue depends on the thickness of the book. However, the forced supply operation is conducted if the temperature of TH2 does not turn to be under the specified temperature even the expected amount of glue is much.
- The maximum stacking capacity of the hopper is 1.2kg.
- To prevent the overflowing of glue from the glue tank, pellet supply is forbidden for 2 minutes after the pellet supply is conducted.

a15xt2c007ca

[1]	Measure bottom plate	[2]	Pellet
[3]	Pellet supply arm	[4]	Glue tank
[5]	Pellet supply pipe	[6]	Pellet supply pipe shutter
[7]	Fixed measure	-	

5.3.2 Pellet supply arm control

- The pellet supply arm motor (M34) activates the pellet supply arm. Once the pellet supply arm moves to the top of the glue tank, the pellet supply pipe motor (M33) conducts the pellet supply operation.
- In order to prevent the arm from the evaporated glue or radiant heat rose from the glue tank, the arm is kept at its home position except when supplying pellets.

(1) Control

- When the glue tank temperature sensor /Up (TH2) detects temperature lower than the set temperature, the pellet supply arm motor (M34) starts to turn in the reverse direction [1].
- When the pellet supply arm reaches the pellet supply position (above the glue tank) and the pellet supply arm upper limit sensor (PS38) becomes ON, the M34 stops [2].
- Once the pellet supply pipe home sensor (PS96) detects that the pellet supply pipe returns to the home position after the pellet is supplied [3], M34 turns in the forward direction and starts the shelter operation [4].
- When the pellet supply arm home sensor (PS39) turns ON and the pellet supply arm reaches the home position, M34 turns OFF.

a15xt2e008ca

[1]	Pellet supply arm motor (M34) ON	[2]	Pellet supply position stop
[3]	Pellet supply	[4]	Start to evacuate
[5]	Evacuation complete	-	

(2) Stop operation during pellet supply

- When all the inside papers have stacked up, while the pellet supply arm motor (M34) is turning in the reverse direction, the M34 reverses the rotation direction to the forward to move the pellet supply arm back to the home position.

5.3.3 Pellet supply amount control**(1) Mechanism**

- It scoops the pellet in the hopper with the fixed measure on the top of the pellet supply pipe and supplies the specified amount of pellet.
- 19g of pellet is supplied by 1 scoop with the fixed measure.
- The pellet supply pipe motor (M33) drives the pellet supply pipe and the agitator blade.

(a) Pellet supply pipe

- The pellet supply pipe has the fixed measure on the top and the supply pipe shutter on the bottom.
- The measure bottom plate [2] and the pellet supply pipe shutter [4] of the fixed measure are driven via the plate cam [6] and operate the opening operation.
- The plate cam is driven between the position 10mm lower from the upper limit of the pellet supply pipe (ON position of the pellet supply pipe upper limit sensor (PS95)) and the upper limit position.
- Once the pellet supply pipe [6] moves up upper than the position 10mm lower from the upper limit, the pin [1] of the measure bottom plate [2] moves along the guide hole [7] of the plate cam and opens the measure bottom plate [2]. It opens fully at the upper limit position.
- The pin [3] of the pellet supply pipe shutter [4] moves along the guide hole [5] and is set to the path to the pellet supply arm.

a15xt2c009ca

[1]	Pin of measure bottom plate	[2]	Measure bottom plate
[3]	Pin of pellet supply pipe shutter	[4]	Pellet supply pipe shutter
[5]	Guide hole	[6]	Plate cam
[7]	Guide hole	-	

(b) Agitator blade

- There are 3 types of agitator blade; /1, /2 and /3. They are pushed out from the bottom of the hopper and agitate and separate the stuck pellet.
- There are 4 agitator blades /1 in total; 2 each [1] and [5] on the bottom of 2 hoppers. They are pushed when the pellet supply pipe moves up to the top.
- There is 1 agitator blade /2 [3] and the agitator blade cam [4] drives it. The agitator blade cam rotates 5 times while the pellet supply pipe moves up to the top and swings the agitator blade /2 for 5 laps.
- There are 8 agitator blades /3 [2] in total; 2 each on 2 each of brackets [6] on the bottom of 2 hoppers. They swing by being pushed by the shaft [7] installed on the agitator blade /1.

a15xt2c010ca

[1]	Agitator blade /1	[2]	Agitator blade /3
[3]	Agitator blade /2	[4]	Agitator blade cam
[5]	Agitator blade /1	[6]	Bracket of agitator blade /2
[7]	Shaft	-	

(2) Control

(a) Supply control

- When the pellet supply arm moves to the pellet supply position and the pellet supply arm upper limit sensor (PS38) turns ON, the pellet supply pipe motor (M33) turns forward rotation ON [1] and lifts the pellet supply pipe.
- When the pellet supply pipe upper limit sensor (PS95) detects that it reaches to the upper limit, M33 turns OFF.
- To swing the pellet supply pipe, M33 turns reverse rotation ON a specified period of time after M33 turns OFF. It stops again when PS95 turns OFF and turns forward rotation ON to move up again. It conducts this swing operation twice.
- After conducting this swing operation twice, it waits [5] for the pellet dropping [4]. M33 turns reverse rotation ON after a specified period of time and starts the home position return operation [6].
- M33 turns OFF [7] when the pellet supply pipe home sensor (PS96) turns ON.

a15xt2j011ca

[1]	Starting lifting the pellet supply pipe	[2]	Reaching to the upper limit of the pellet supply pipe
[3]	Swing of the pellet supply pipe	[4]	Pellet supply
[5]	Standby for the pellet dropping	[6]	Starting home position return operation
[7]	Completing home position return operation	-	

(b) Pellet passage detection

- The pellet supply passage sensor (PS37) monitors the passage of the pellet on the pellet supply path. It monitors it for the period between when the pellet supply pipe motor (M33) starts the supply operation turning ON the pellet supply pipe upper limit sensor (PS95) for the first time and when the supply operation finishes with turning ON the pellet supply pipe home sensor (PS96) by the home

position search of the M33. When PS37 detects the glue passage without turning ON once, it displays the glue supply alarm. When PS37 detects the glue passage without turning ON more than twice, it displays C-1517.

5.3.4 Pellet remaining amount detection control

- The pellet remaining LED (LED32) and the pellet supply remaining sensor (PS36) detect the remaining amount of the pellet.
- While the pellet supply arm is in the home position turning the pellet supply arm lower limit sensor (PS39) ON, the detection of remaining number of pellets inside the pellet supply hopper is carried out.
- When the remaining amount of pellet becomes 150g or less, the pellet supply hopper is detected as empty.
- When 1 second has elapsed after the pellet supply remaining sensor (PS36) switches to OFF from ON, a message to notify the empty status appears on the main body touch panel.

5.3.5 Pellet supply door opening/closing detection control

- The pellet supply door switch (MS1) [1] and the pellet supply door sensor (PS40) [2] detect the open/close of the pellet supply door.
- When the MS1 is turned OFF, 24VDC supplied to the pellet supply motor (M33) is shut off to stop the motor.
- When the PS40 detects the above status, a message appears on the main body touch panel.

[3]	Cover paper glue up solenoid (SD32)	[4]	Left-side view
[5]	Glue apply roller		-

6.3 Operation

6.3.1 Glue tank unit movement control

(1) Mechanism

- The glue tank unit is moved by the drive force of the glue tank movement motor (M31) transmitted via the timing belt. The gap [3] between the glue tank HP sensor (PS33) and the center [5] of the inside papers [4] is 322.5mm.
- It conducts the gluing operation by shuttling (going back and forward).

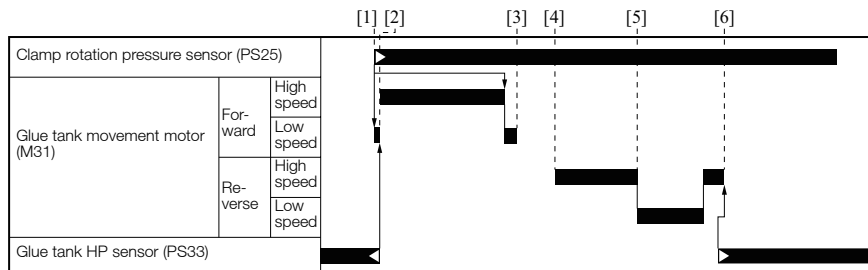

a15xt2c016ca

[1]	Front side	[2]	Glue tank HP sensor (PS33)
[3]	322.5mm	[4]	Inside paper
[5]	Center of the inside papers	-	

(2) Control

- When the upright movement of the clamp section finishes turning the clamp rotation pressure sensor (PS25) ON, the glue tank movement motor (M31) starts to turn in the forward direction at low speed to move the glue tank forward [1].
- M31 switches [2] to the high speed when the glue tank HP sensor (PS33) turns OFF and conducts the gluing operation to the inside paper during forward movement.
- After a specified period of time since the gluing operation during forward movement completes, M31 switches to the low speed and stops [3].
- After a specified period of time, M31 turns ON (turns in reverse at low speed) [4] and starts going back.
- After a specified period of time, it switches to the high speed drive [5] and conducts the gluing operation during going back.
- After a specified period of time, M31 stops [6] at the position where the glue tank HP sensor (PS33) turns ON and passes 2mm after it switches to the low speed at the timing of the completing of gluing.

a15xt2e017ca

[1]	Clamp rotation assy is upright	[2]	Switch to high speed
[3]	Stop going forward	[4]	Start going back
[5]	Switch to high speed	[6]	Stop at the position where 2mm over from home position

6.3.2 Glue apply roller control

(1) Mechanism

- The glue apply roller motor (M32) drives the glue apply roller via the gear.
- As the glue apply roller rotates, a layer of molten glue is formed on the roller metal surface due to the viscosity of the glue.
- The thickness of glue layer can be changed by changing the rotation number of the glue apply roller. The glue layer turns to be thicker by rotating at high speed. *1

*1 The standard glue layer of the glue apply roller is about 2.0mm.

(2) Control

(a) Operation during printing

- After a specified period of time since the glue tank movement motor (M31) moves forward, conducts the gluing operation for the outward and switches to the low speed, the glue apply roller motor (M32) which has turned ON turns OFF [1] and the glue apply roller stops.
- After a specified period of time since it turns OFF, it turns reverse rotation ON [2] before M31 starts going back.
- When M31 turns ON to start going back, the gluing operation during the glue tank going back for return. After a specified period of time since M31 turns ON, M32 turns OFF [3].

4. After a specified period of time since M32 turns OFF, M32 turns forward rotation ON preparing for the next book.

[1]	Forward rotation OFF by the completion of the gluing for outward	[2]	Reverse rotation ON for return
[3]	Reverse rotation OFF for return	[4]	Forward rotation ON of the next book

(b) Operation during warming up

- Once the glue tank temperature sensor /Md (TH3) reaches to the specified temperature (100 °C), the glue apply roller motor (M32) turns forward rotation ON and turns OFF after a specified period of time (3 seconds).
- After a specified period of time (3 seconds) since it turns OFF, it turns forward rotation ON again.
- It repeats the above mentioned interval operation until TH3 reaches to the specified temperature *1.
- Once TH3 reaches to the specified temperature, M32 turns ON at all times (forward rotation).
- When the glue applying mode is switched to standby mode, the M32 stops.

*1 Default setting: 145 °C (It can be changed by "Glue Tank -Mid" of "I.5.13.45 PB-503 Temperature Adjustment (Perfect Binder Adjustment).")

6.3.3 Glue tank lifting control

(1) Mechanism

- When the glue tank up solenoids /1 (SD31) [3] and /2 (SD33) [4] turn ON, the arm [5] lifts the roller [2] and the glue tank [1] moves up. Then, the glue apply roller moves up to the glue apply position.

a075t2c072ca

[1]	Glue tank	[2]	Roller
[3]	Glue tank up solenoid /1 (SD31)	[4]	Glue tank up solenoid /2 (SD33)
[5]	Arm	-	

- When the glue tank up solenoids /1 (SD31) and /2 (SD33) are ON, the gap between the level tangent line [5] of the metal surface [1] of the glue apply roller and the spine surface [7] of inside paper [6] is the gap of the glue apply roller. *1
- The scrape plates /Fr [2] and /Rr [4] scrape off excess glue from the spine of inside papers.
- When SD31, SD33 and the cover paper glue up solenoid (SD32) are ON, the scrape plate /Fr is placed 1.5mm under the spine surface [7], and 2.5mm when SD32 turns OFF. *2
- When SD31, SD33 and SD32 are ON, the scrape plate /Rr is placed 1.0mm *2 under the spine surface [7].

*1 The standard of the glue apply roller gap is 1.8mm and it can be changed by the mechanical adjustment "I.24.4 Glue apply roller gap adjustment".

*2 The mechanical adjustment "I.24.5 Cover paper glue gap adjustment" can adjust the scraped-off glue amount.

[1]	Metal surface of the glue apply roller	[2]	Scrape plate /Fr
[3]	Front side	[4]	Scrape plate /Rr
[5]	Level tangent line	[6]	Inside paper
[7]	Spine surface	[8]	Layer of molten glue

(2) Control

- When the upright movement of the clamp section finishes [1] by turning the clamp rotation pressure sensor (PS25) ON, the glue tank movement motor (M31) turns ON and the glue tank assy starts moving forward. While the glue tank assy is moving, the glue tank up solenoids /1 (SD31) and /2 (SD33) turn ON to lift the glue apply roller to apply glue to the spine of inside paper [2] after a specified period of time since M31 turns ON.
- When the glue has applied along the inside paper spine by a length of 5mm longer than the paper length after a specified period of time since M31 has turned to high speed, SD31 and SD33 turn OFF to lower the glue apply roller [3].
- After a specified period of time since the going back starts by the reverse rotation ON of M31, SD31 and SD33 turn ON at the timing when the glue apply roller passes the paper edge 4mm and conduct the gluing operation for going back [4].
- After a specified period of time, SD31 and SD33 turn OFF [5] at the position the glue apply roller passed trailing edge of the inside paper through by 4mm.

Note

- The sensors ON/OFF timing can be changed in the service mode.

[1]	Clamp rotation assy is upright	[2]	Glue application during frontward movement
[3]	Completion of glue application	[4]	Glue application during backward movement
[5]	Completion of glue application	-	

6.3.4 Cover paper glue control

(1) Mechanism

- The cover paper glue up solenoid (SD32) [5] lifts the scrape plate /Fr side [9] of the glue tank base plate [2].
- The glue tank up solenoid /1 (SD31) [4] and /2 (SD33) [3], which lift the glue apply roller [8] side of the glue tank, are also attached to the glue tank base plate, and as the result, the whole glue tank assy is lifted.
- Changing the height of the scrape plate with SD32 turning ON/OFF controls the thickness of the glue layer. Switches the thick coat mode and the thin coat mode. The thick coat mode is for keeping the book strength. *1
 - Thin coat mode (SD32: ON)
Thickness of paper is less than 7mm: The glue apply thickness is 0.8mm
 - Thick coat mode (SD32: OFF)
Thickness of paper is 7mm or more: The glue apply thickness is 1.2mm

*1 In the case of 1200/1200P/1051/1250/1250P/1052, only the thin coat mode is used no matter how thick the paper bundle is.

a15xt2c021ca

[1]	Glue tank	[2]	Glue tank base plate
[3]	Glue tank up solenoid /2 (SD33)	[4]	Glue tank up solenoid /1 (SD31)
[5]	Cover paper glue up solenoid (SD32)	[6]	Fulcrum shaft
[7]	Left-side view	[8]	Glue apply roller
[9]	Scrape plate /Fr	-	

(2) Control

- The control differs depending on the glue apply thickness mode. *1
 - Thin coat mode
The cover paper glue up solenoid (SD32) turns ON a specified time before turning ON the tank up solenoids /1 (SD31) and /2 (SD33) and turns OFF at the same time when SD31 and SD33 turn OFF.
 - Thick coat mode
Always OFF.
- *1 In the case of 1200/1200P/1051/1250/1250P/1052, only the thin coat mode is used no matter how thick the paper bundle is.

6.3.5 Glue temperature control

(1) Mechanism

- The glue tank heater (H1) heats the glue tank bottom to melt the pellets.
- The glue apply roller heater (H2) heats the glue apply roller to keep the glue adhered to the roller surface at a constant viscosity.

(2) Temperature detection

The glue apply roller temperature sensor (TH1) [7] detects the temperature of the glue apply roller [8], and the glue tank temperature sensor / Up (TH2) [6], /Md (TH3) [3], and /Lw (TH4) [2] detects the temperature of the glue tank [5].

(a) TH1

- Detects temperature of the center portion of the glue apply roller, and the glue apply roller heater (H2) [9] is controlled according to the detected temperature.
- The target temperature is 165°C. *1
*1 It can be changed by "Adjustment screen" or "Apply Roller" of Service Mode "[I.5.13.45 PB-503 Temperature Adjustment \(Perfect Binder Adjustment\)](#)". "

(b) TH2

- This sensor is provided on the inner surface of the glue tank, at the position 29mm above the bottom of the tank, in order to detect glue level.
- When the glue runs low, the glue surface becomes lower, and finally the TH2 comes out of the glue. It causes a sudden drop in temperature of the TH2. The temperature drop is detected as a low glue level, and activates the pellet supply operation.
- The target temperature is 132°C. *1
*1 It can be changed by "Glue Tank -Top" of Service Mode "[I.5.13.45 PB-503 Temperature Adjustment \(Perfect Binder Adjustment\)](#)". "

(c) TH3

- This sensor is also provided on the inner surface of the glue tank, at the position 15.4mm above the tank bottom, to detect the viscosity of the molten glue. According to the detected result, rotating or not rotating the glue apply roller is determined.
- The target temperature is 145°C. *1
*1 It can be changed by "Glue Tank -Mid" of Service Mode "[I.5.13.45 PB-503 Temperature Adjustment \(Perfect Binder Adjustment\)](#)". "

(d) TH4

- The glue tank temperature sensor /Lw (TH4) is provided on the inner bottom surface of the glue tank and detects temperature of the glue tank heater (H1) [3] to control the heater.
- The target temperature is 185°C. *1
*1 It can be changed by "Adjustment screen" or "Glue Tank -Low" of Service Mode "[I.5.13.45 PB-503 Temperature Adjustment \(Perfect Binder Adjustment\)](#)". "

a075t2c076cb

[5]	Glue tank	[6]	Glue tank temperature sensor /Up (TH2)
[7]	Glue apply roller temperature sensor (TH1)	[8]	Glue apply roller

(3) Control

(a) Glue apply roller heater (H2) control

- During warming up, H2 turns ON so that the glue apply roller temperature sensor (TH1) is 180 °C. It lowers to 165 °C when the warming up completes.
- After the completion of the warming up, it controls ON/OFF of H2 so that the glue apply roller temperature sensor (TH1) is 165 °C.
- When the temperature drops/rises 1°C from the target temperature, the H1 turns ON/OFF.

(b) Glue tank heater (H1) control

- The H1 is turned ON/OFF according to a temperature detected by the glue tank temperature sensor /Lw (TH4) in order to keep 185 °C.
- When the temperature drops/rises 1°C from the target temperature, the H1 turns ON/OFF.

-----	-------------------------------------	-----	----------------

7.3 Operation

7.3.1 Up/down control

(1) Up operation

- The cover paper tray lift plate is lifted with the cover paper tray lift wire wound up around the pulley by the drive force of the cover paper tray lift motor (M73) [1].

(2) Down operation

- When the cover paper tray is pulled out, the release lever [5] separates the coupling gear [4] that transmits the motor drive force from the motor shaft [2] to the pulley [3]. (goes down by its own weight)

a075t2c016ca

[1]	Cover paper tray lift motor (M73)	[2]	Motor shaft
[3]	Pulley	[4]	Coupling gear
[5]	Release lever	-	

- In order to lower the plate slowly by its own weight, the torque limiting gear [1] works only when lowering the cover paper tray lift plate.

a075t2c017ca

[1]	Torque restriction gear	-	
-----	-------------------------	---	--

(3) Operation timing

(a) When cover paper is set

- When cover papers are loaded on the tray, the cover paper tray lift motor (M73) starts to rotate to lift the cover paper lift plate.
- The M73 stops when the cover paper tray upper limit sensor (PS74) turns ON.

(b) While feeding cover paper

- While cover papers being fed, the PS74 turns OFF due to a decrease in stacking height of papers, and the M73 starts to rotate again.
- The M73 keeps rotating to lift the cover paper lift plate until the PS74 turns ON again.

a075t2c132ca

[1]	Cover paper tray upper limit sensor (PS74)	-	
-----	--	---	--

7.3.2 Pick-up mechanism

- Picking up the cover paper is activated when the cover paper pick-up solenoid (SD71) turns OFF.

(1) Control

- With cover paper feed signal, cover paper feed motor (M74), cover paper feed clutch (CL71) and cover paper separation clutch (CL72) turn ON, and rotate the pick-up roller which is pressing down the cover paper with its own weight, and starts the paper feeding of the cover paper [1].
- When the cover paper conveyance sensor /1 (PS75) is turned ON by the leading edge of the cover paper, M74, CL71, CL72 are temporary turned OFF, and cover paper feeding is stopped [2].
- After the specified time, M74, CL71, CL72 are turned back ON, and the leading edge of the cover paper is sent to the cover paper conveyance sensor /2 (PS76), then M74, CL71 are turned OFF again [3].
- After the specified time, M74, CL71, CL72 are turned back ON, and the leading edge of the cover paper is sent to the cover paper conveyance sensor /3 (PS77), then M74, CL71, and CL72 are turned OFF again [4].
- After the specified time, M74, CL71, CL72 and the cover paper pick up solenoid (SD71) are turned ON, the pick up roller is put back to its original position, and the cover paper is conveyed by only the paper feed roller and the conveyance roller [5].
- When the leading edge of the cover paper turns ON the cover paper conveyance sensor /4 (PS78), M74, CL71, CL72, SD71 turn OFF [6].
- After the specified time, M74 rotates at high speed, cover paper is conveyed by only the conveyance roller while CL72 turns ON and the next cover paper is sent to the reverse direction to be separated [7].
- After the back edge of the cover paper has passed the PS76, CL72 and SD71 turn OFF, and the paper feeding of the first sheet of cover paper completes [8].

[1]	Cover paper supply signal on	[2]	Conveyed to PS75
[3]	Conveyed to PS76	[4]	Conveyed to PS77
[5]	Pick up roller goes back to its original position	[6]	Conveyed to PS78
[7]	Conveyance of conveyance roller only	[8]	Pick up paper feeding of first sheet of cover paper complete

7.3.3 Separation mechanism

- The drive force of the cover paper feed motor (M74) is transmitted to the separation roller [4] via the torque limiter [3] when the cover paper separation clutch (CL72) [2] is ON/OFF.
- The separation roller [4] is driven in the direction opposite to the cover paper feeding direction. However, the roller rotates in the same direction with the paper feed direction as long as 1 sheet of cover paper or no paper is fed because the friction force between the cover paper feed roller [1] and separation roller [4], or paper and the separation roller is larger than the torque limited by the torque limiter [3].
- When multi-feed occurs, the separation roller reverses the rotation direction to feed the lower sheet that contacts with the roller back to the tray because the friction force drops due to the multi-feed and becomes lower than the torque limited by the torque limiter.

a075t2c019ca

[1]	Paper feed roller	[2]	Cover paper separation clutch (CL72)
[3]	Torque limiter	[4]	Separation roller
[5]	Second sheet of cover paper	[6]	First sheet of cover paper
[7]	Pick-up roller	-	

7.3.4 Paper feed mechanism

- The cover paper feed motor (M74) drives the conveyance roller. Cover papers fed from the feeding section are conveyed to the conveyance section by the conveyance roller.

7.3.5 Air assist mechanism

- The cover paper tray is equipped with the cover paper tray fan /1 (FM71) and /2 (FM72), which blow air [4] to the cover paper [3] from the front and back cover paper guides.
- Using the tray fans is effective especially when feeding heavy paper or coated paper. However, in the case of plain paper, it may not be fed smoothly.

[1]	Cover paper tray fan /1 (FM71)	[2]	Cover paper tray fan /2 (FM72)
[3]	Cover paper	[4]	Blow-out of air

(1) Operation timing

- When receiving a print job, cover paper tray fans /1 (FM71) and /2 (FM72) turn ON, and after the specified time, cover paper feed motor (M74) turns ON.

7.3.6 Cover paper empty detection control

- The cover paper empty sensor (PS71) detects an empty status of the cover paper tray.

7.3.7 Paper feed assist plate

(1) Purpose

The paper feed assist plate (P/N: 56UA4070) can be attached to the pick-up roller to adjust the pressure to cover paper applied from the roller. By changing the number of plates to be attached to the roller depending on the cover paper type, paper feed accuracy can be improved.

Using the plates is effective especially when feeding coated cover paper or similar type that is likely to stick tightly causing no-feed trouble. The paper feed assist plate weighs about 10g and up to 4 plates can be attached to 1 pick-up roller in normal condition. When the surface of the cover paper is powdery, up to 8 plates can be attached. Increase or decrease the number of plates according to paper type or condition to improve cover paper feed accuracy.

(2) Configuration

The package contains the following as a set.

[1] Paper feed assist plate	4 plates
[2] Screws	2 screws (M3 x 8)

It can be purchased as the service part if necessary.

1050to2312c

8. COVER PAPER TABLE SECTION

8.3 Operation

8.3.1 Cover paper table section operation overview

1. The cover paper conveyance arms /Rt [4] and /Lt [10] are activated when detecting that the print start signal turns ON, and they are pressed against the cover paper conveyance rollers /Rt [5] and /Lt [8].
2. When a cover paper is fed [7], alignment operation is carried out by the cover paper alignment plate /Rr and /Fr [6].
3. After the thickness of inside papers [11] is detected by clamping operation made by the clamp pressure plate [12], the cover paper is fed backward (switchback) [2].
4. The backward feeding is made to feed the cover paper to the roller cutter assy so that the paper edge protrudes away from the cover paper switchback sensor (PS44) [3] by the trimming amount.
5. The roller cutter [1] trims the cover paper edge and then the paper is conveyed to the left side again.
6. Alignment operation to attach the cover paper to the inside papers is carried out.

7. The cover paper is moved to left and right by the reverse/forward rotation of the cover paper conveyance rollers /Rt and /Lt for positioning properly with reference to the cover paper sensor /Lt (PS46) [9] as starting point.

[1]	Roller cutter	[2]	Switchback conveyance
[3]	Cover paper switchback sensor (PS44)	[4]	Cover paper conveyance arm /Rt
[5]	Cover paper conveyance roller /Rt	[6]	Cover paper alignment plate /Rr, /Fr
[7]	Cover paper conveyance	[8]	Cover paper conveyance roller /Lt
[9]	Cover paper sensor /Lt (PS46)	[10]	Cover paper conveyance arm /Lt
[11]	Bundle of inside papers	[12]	Clamp pressure plate

8. When the alignment operation of the cover paper completes and CD alignment plate returns to home position, the cover paper folding plates /Rt [3] and /Lt [5] are opened [4].
9. When the cover paper on the lifted unit attaches to the spine of inside papers [8], the book spine backing plate [1] presses against the spine to attach the cover paper securely.
10. The cover paper folding plates /Rt and /Lt are moved inward to press [6] both edge surfaces of the spine to create the perfect corners. During up and down operation of the cover paper table unit, the cover paper conveyance arms /Rt [9] and /Lt [7] are moved away from the cover paper so as not to let the paper pulled by the arms.
11. The pressures to the spine are applied for 3 seconds for the glue to harden fully.

[1]	Book spine backing plate	[2]	Lift of cover paper table unit
[3]	Cover paper folding plate /Rt	[4]	Opening

[5]	Cover paper folding plate /Lt	[6]	Pressurize
[7]	Cover paper conveyance arm /Lt	[8]	Bundle of inside papers
[9]	Cover paper conveyance arm /Rt	-	

12. The cover paper folding plates /Rt and /Lt are opened, and the cover paper table unit is lowered [3].
13. While the cover paper table is going down, the inside papers of the book [7] are held by the clamp pressure plate [8]. Since both sides of the cover paper [9] bow, the cover paper lift plate /Lt [5] integrated with the cover paper conveyance arm /Lt [6] supports the left-side of the cover paper. The right-side of the paper triggers the cover lift plate /Rt [2] and supports the cover. The cover paper conveyance arm /Rt [1] is moved away from the cover paper lift plate /Rt.
14. The book exit belt [4] is moved to the position to receive the book.

a075t2c088ca

[1]	Cover paper conveyance arm /Rt	[2]	Cover paper lift plate /Rt
[3]	Down	[4]	Book exit belt
[5]	Cover paper lift plate /Lt	[6]	Cover paper conveyance arm /Lt
[7]	Book	[8]	Clamp pressure plate
[9]	Cover paper	-	

15. When the book exit belt is set at the receiving position, the cover paper table unit is lifted again.
16. When lifting the unit is started, the cover paper conveyance arms /Rt [2] and /Lt [3] are folded [1] [4] to keep them from contact with the clamp section.

a075t2c089ca

[1]	The arm is folded	[2]	Cover paper conveyance arm /Rt
[3]	Cover paper conveyance arm /Lt	[4]	The arm is folded

17. When the book (inside papers) [8] is released from the clamp pressure plate [9], the cover paper table unit is lowered.
18. At the start of the unit lowering operation, the cover paper conveyance arm /Rt [2], /Lt [7], and the cover paper folding plate /Rt [3], /Lt [4] are returned to their home positions. When the cover paper lift plate /Lt [6] returns to its home position, it flips up the left-side of the cover paper toward the inside papers.
19. The book exit belt [5] is activated after a prescribed time has elapsed since the table unit lowering operation is started so that the belt starts to move at the same time the book contacts with the belt and the book is laid down on the belt.

a075i2c090ca

[3]	Cover paper folding plate /Rt	[4]	Cover paper folding plate /Lt
[5]	Book exit belt	[6]	Cover paper lift plate /Lt
[7]	Cover paper conveyance arm /Lt	[8]	Book
[9]	Clamp pressure plate	-	

20. The cover paper table unit goes down to its home position, and then goes up until the book exit belt surface becomes horizontal to the book conveyance belt [3] surface.
21. The book exit belt [1] starts to move again to convey the book [3] on it to the book stock section.

a075i2c091ca

[1]	Book exit belt	[2]	Book conveyance belt
[3]	Book	-	

8.3.2 Cover paper conveyance control

(1) Mechanism

- The cover paper conveyance motor (M45) drive force transmitted via the gear and the belt drives the cover paper table entrance roller [3], the cover paper conveyance rollers /Rt [5] and /Lt [6].
- A cover paper is conveyed being nipped between the driven rollers [9] and [10] provided on the tips of the cover paper conveyance rollers /Rt and /Lt and the cover paper conveyance arms /Rt [1] and /Lt [8].
- On the cover paper conveyance path, the cover paper sensor /Rt (PS45) [4], /Lt (PS46) [7] and the cover paper switchback sensor (PS44) [2] are provided.
- The PS44 is used to position the cover paper for trimming.
- PS45 is the starting point of when carrying in cover paper to the up/down cover paper section. Cover paper is carried in after specified time from when PS45 detected the leading edge of the paper, cover paper stops and alignment operation is carried out.
- The PS46 is used to position the cover paper to be attached to the spine of inside papers.

a075t2c092ca

[7] Cover paper sensor /Lt (PS46)	[8] Cover paper conveyance arm /Lt
[9] Driven roller /Rt	[10] Driven roller /Lt

(2) Control

(a) When conveying cover paper from the PB cover paper tray

- Upon receiving of a print job, the cover paper conveyance motor (M45) starts to turn in the forward direction [1].
- The M45 stops [2] when a prescribed time has elapsed after the cover paper sensor /Rt (PS45) detects the leading edge of the cover paper.
- When clamping the inside papers is finished, the booklet thickness sensor (PS29) detects the last pulse and the book thickness information is obtained. Then the M45 starts reverse rotation [3] to convey the cover paper toward the roller cutter assy.
- The cover paper moves until it reaches the position to be trimmed off by the amount determined according to the paper size setting and the book thickness information, and the M45 stops [4].
- When the cutter end position switch (SW42) detects the finish of the cutting operation [5], the M45 starts forward rotation to convey the cover paper to the left-hand for the alignment.
- The M45 stops [6] when a prescribed time has elapsed after the PS44 detects the trailing edge of the cover paper.
- When the alignment operation by the cover paper alignment motor (M41) is finished [7], the cover paper is conveyed to the right-hand by the M45 reverse rotation for the next positioning operation.
- The M45 keeps rotating to position the cover paper properly to be attached to the inside papers until the cover paper sensor /Lt (PS46), the reference sensor for the positioning, turns OFF [8].
- After a prescribed time has elapsed, the M45 starts forward rotation to convey the cover paper to the left hand [9] and stops [10] after the PS46 detects the leading edge of the cover paper.

a075t2e093ca

[1]	Print start signal ON	[2]	Cover paper conveyance to the cover paper table is finished

[5]	Trimming is completed	[6]	Cover paper stops for alignment
[7]	Cover paper alignment is completed	[8]	Cover paper positioning reference search
[9]	Starting cover paper positioning	[10]	Cover paper positioning is completed

8.3.3 Cover paper trimming control

(1) Mechanism

- The cutter motor (M50) drives the roller cutter via the pulley and the wire.
- The front side is the home position and the trimming is carried out when the cover paper is moved to the back side from the front side.

(2) Control

1. When the cover paper is conveyed to the roller cutter assy by the cover paper conveyance motor (M45), the motor stops [1] and the cutter motor (M50) starts forward rotation to start the trimming operation.
2. When the cutter blade cut the paper and reaches the limit position, the cutter end position switch (SW42) turns ON and the M50 stops. At the same time, the M45 starts forward rotation to convey the cover paper.
3. When the conveyance by the M45 is finished [3], the M50 starts to rotate again to make the cutter return to its home position.
4. When the cutter is set in its home position [4], the cutter HP switch (SW41) becomes ON and the M50 stops.

[1]	Start of cutting	[2]	Trimming is completed
[3]	Starting home position return operation	[4]	Cutter is set in its home position

8.3.4 Cover paper alignment drive

(1) Mechanism

- The cover paper alignment motor (M41) drives the cover paper alignment plates /Fr [2] and /Rr [5], the book exit belts /Fr [3] and /Rr [4] for changing their positions.
- The cover paper alignment plate /Rr presses the cover paper against the cover paper alignment plate /Fr to position the cover paper properly, and the cover paper alignment /Fr judges the alignment accuracy.

a07512c095ca

[1]	Cover paper	[2]	Cover paper alignment plate /Fr
[3]	Book exit belt /Fr	[4]	Book exit belt /Rr
[5]	Cover paper alignment plate /Rr	-	

(2) Control

(a) Cover paper trimming mode

- When detecting that the print start signal turns ON [1], the cover paper alignment motor (M41) starts forward rotation to set the alignment parts in the positions for the alignment operation, and stops [2].
- After the conveyance arms /Rt and /Lt move away from the cover paper conveyance rollers /Rt and /Lt by the cover paper conveyance arm motors /Rt (M43) and /Lt (M44), and the arms stops, the M41 starts forward rotation to position the cover paper to be trimmed [3].
- When the cover paper is set at the trimming position with the cover paper alignment plates /Rr and /Fr holding down both sides of the paper, the M41 stops [4].
- The conveyance arms /Rt and /Lt are pressed against the cover paper conveyance rollers /Rt and /Lt [5] by the M43 and M44 drive force. Then the M41 starts reverse rotation to move the cover paper alignment plates /Rr and /Fr away from the cover paper, and stops.
- When the cover paper trimming is finished, the cover paper alignment operation [6] to be attached to the inside papers is performed in the same manner as for the trimming.
- When positioning the cover paper by the cover paper conveyance motor (M45) is finished, the M41 starts reverse rotation to perform preparation operation [7] for the next cover paper table lifting operation.
- The M41 stops [8] when the cover paper alignment home sensor (PS41) becomes ON.

[7]

[1]	Print start signal ON	[2]	Setting the plates and belts ready for the conveyance
[3]	Positioning (alignment) for cover paper trimming	[4]	Stops at the trimming position
[5]	Positioning (alignment) cover paper to be attached to inside papers	[6]	Starting preparation for cover table lifting operation
[7]	Alignment-related parts return to its home position	[8]	Returning to the home position

(b) Cover paper Not trimming mode

When the sub-scanning direction length of inside papers is over 182mm, the first positioning operation for trimming is not performed. Only the positioning operation for attaching the cover to the inside papers is performed.

However, when the inside paper is smaller than B5 size, alignment is done twice. Once when cover paper is carried in, and once after leading edge positioning is done.

8.3.5 Cover paper table up down control**(1) Mechanism**

- The cover paper table up down motor /Fr (M46) drives the cover paper table up down belts /Fr_Rt [9] and /Fr_Lt [5], and the cover paper table up down motor /Rr (M47) drives the cover paper table up down belts /Rr_Rt [1] and /Rr_Lt [2].
- The cover paper table upper limit sensor /Fr (PS26) [3] detects that the front side of the cover paper table that is driven by the M46 reaches the upper limit.
- The cover paper table upper limit sensor /Rr (PS27) [4] detects that the rear side of the cover paper table that is driven by the M47 reaches the upper limit.
- The cover paper table home sensor /Fr (PS47) [7] detects that the front side of the cover paper table is in its home position, and the cover paper table home sensor /Rr (PS53) [8] detects that the rear side of the cover paper table is in the home position.

a07512c097ca

[1]	Cover paper table up down belt /Rr_Rt	[2]	Cover paper table up down belt /Rr_Lt

[5]	Cover paper table up down belt/Fr_Lt	[6]	Front side
[7]	Cover paper table home sensor /Fr (PS47)	[8]	Cover paper table home sensor /Rr (PS)
[9]	Cover paper table up down belt /Fr_Rt	-	

(2) Control

- When applying glue to the spine of inside papers is finished and the glue tank HP sensor (PS33) turns ON, the cover paper table up down motors /Fr (M46) and /Rr (M47) start forward rotation to lift the cover paper table [1].
- During a prescribed time period after the cover paper table upper limit sensors /Fr (PS26) and /Rr (PS27) become ON, the cover paper is pressed against the spine of inside papers, and then M46 and M47 stop [2].
- After the book spine ends are neatly folded, the cover paper folding motor /Rt (M48) moves the cover paper folding plate /Rt away from the book and stops, and then the reverse rotation of the M46 and M47 lowers the cover paper table [3].
- The M46 and M47 keeps rotating until the cover paper table reaches the position to receive the book, and they stop [4].
- When the cover paper alignment motor (M41) drives the book exit belt (attached to the cover paper alignment plates /Fr and /Rr) to the position to receive the book, and stops, the M46 and M47 start forward rotation to lift the cover paper table [5].
- The motors stop [6] when the cover paper table reaches to the position to receive the book.
- When the clamp home sensor (PS22) turns ON upon completion of opening movement of the clamp pressure plate (the book is released from the plate), the M46 and M47 starts reverse rotation to lower the cover paper table [7] to receive the book.
- The M46 and M47 stop when the cover paper table home sensors /Fr (PS47) and /Rr (PS53) detect that the cover paper table reaches its home position.
- When the booklet exit motor (M42) drives the book exit belt to convey the book to the predetermined position and stops, the M46 and M47 starts forward rotation to lift the cover paper table [9].
- In order to align the surface of the book exit belt with that of the book conveyance belt in the book stock section, the cover table is lifted by 60mm and the M46 and M47 stop [10].

11. When the booklet end sensor (PS61) turns ON detecting that the book has exit to the book stock section [11], the M46 and M47 starts reverse rotation to lower the cover paper table until the PS47 and PS53 turn ON, and then the motors stop [12].

[1]	Completion of glue application	[2]	Completion of pressing the book spine
[3]	Starting to lower the cover paper table for preparing book receiving operation	[4]	Standby for receiving book
[5]	Book exit belt movement is finished	[6]	Going up and stopping at the position to receive book
[7]	Starting book receiving operation	[8]	Stopped at home position
[9]	Starting lifting to the book exit position	[10]	Lifting by 60mm
[11]	Book exit is finished	[12]	Returning to the home position

8.3.6 Cover paper folding plate control

(1) Mechanism

(a) OUTLINE

- In order to let the book spin ends to form perfect corners, the cover paper folding motors /Rt (M48) and /Lt (M49) move the cover paper folding plates /Rt [1] and /Lt [3] respectively inward to press the book spine [6] from both left and right side with the spine pressed by the book spine backing plate [2] on the cover paper [8].
- The cover paper folding plate /Lt is used as the reference position [4], and the cover paper folding plate /Rt presses the book against the plate /Lt with spring load.
- The standby position of the cover paper folding plate /Lt is 15mm [5] left from the reference position [4], and that of the cover paper folding plate /Rt is 15mm [7] right from the right end of the book regardless of the book thickness.

[1]	Cover paper folding plate /Rt	[2]	Book spine backing plate
[3]	Cover paper folding plate /Lt	[4]	At the reference position
[5]	15mm	[6]	Book
[7]	15mm	-	

(b) Pressure mechanism

- The cover paper folding motor /Rt (M48) [5] drives the cover paper folding operation via the gear.
- The cover paper folding pressure sensor (PS52) [4] detects the pressure applied to the book.
- The cover paper folding plate encoder sensor (PS50) [6] detects how much the M48 has rotated.

a075t2c100ca

[1]	Cover paper folding plate /Rt	[2]	Book
[3]	Pressure drive plate /Rt	[4]	Cover paper folding pressure sensor (PS52)
[5]	Cover paper folding motor /Rt (M48)	[6]	Cover paper folding plate encoder sensor (PS50)

(2) Control

- When the cover paper table up down motors /Fr (M46) and /Rr (M47) start to rise to stick the cover paper to the book spine and cover paper alignment completes, when the CD alignment plate returns to home position, the cover paper folding motors /Rt (M48) and /Lt (M49) start forward rotation to move the cover paper folding plates /Rt and /Lt outward [1].
- The M49 stops [2] when a prescribed time has elapsed after the cover paper folding plate position sensor (PS51) turns ON.
- The M48 stops [3] when the cover paper folding plate encoder sensor (PS50) has count certain pulses correspond to the book thickness.
- When the M46 and M47 stop upon completion of pressing the cover paper against the spine of inside papers, the M48 and M49 start reverse rotation to move the cover paper folding plate /Rt and /Lt inward (toward the book) [4].
- When the cover paper folding plate /Lt has moved to the reference position during a prescribed time period after the cover paper folding plate home sensor /Lt (PS49) turns ON, the M49 stops [5].
- When the cover paper folding pressure sensor (PS52) turns ON [6], the PS50 starts to count again until the pressure plate moves 3mm pressing the book, and then the M48 stops [7].
- The M48 and M49 start forward rotation to release the book from the pressure [8].
- The M49 stops [9] when the cover paper folding plate /Lt reaches its standby position after the PS51 turns ON.
- The M48 stops [10] when the cover paper folding plate /Rt reaches its standby position after the PS50 counted certain pulses.
- When the M46 and M47 start to rotate to lower the cover paper table, the M48 and M49 start to drive to return the cover paper folding plates to their home positions [11].

a075t2e101ca

[3]	Cover paper folding plate /Rt stops at the standby position	[4]	Starts to fold cover paper

[5]	Cover paper folding plate /Lt stops at the reference position	[6]	Start to apply pressure to the book
[7]	Stops applying a certain pressure to the book	[8]	Releasing book after pressing it for a certain time to harden the glue
[9]	Cover paper folding plate /Lt stops at the standby position	[10]	Cover paper folding plate /Rt stops at the standby position
[11]	Returning to the home position	-	

8.3.7 Cover paper conveyance arm control

(1) Mechanism

- The cover paper conveyance arms /Rt [5] and /Lt [10] press/separate the driven rollers [4] and [11] against/from the cover paper conveyance rollers /Rt [7] and /Lt [8].
- The cover paper conveyance arm /Lt is equipped with the cover paper lift plate /Lt [9] which lifts the left-side of the cover paper to prevent it from being fold while the cover paper alignment plates (book exit belts) are moved inward to attach the cover paper to the inside papers.
- The cover paper conveyance arm motors /Rt (M43) and /Lt (M44) drive the cover paper conveyance arms /Rt and /Lt via the pins [2] and [14].
- While conveying a cover paper, the pins [2] and [14] come off the notches [1] and [12] of the cover paper conveyance arms, and the cover paper conveyance rollers /Rt and /Lt are pressed against the paper with the spring load [3] and [13].
- The cover paper conveyance arm home sensors /Rt (PS42) [6] and /Lt (PS43) [15] detect that the arms are in their home positions. The upright positions of the paper cover conveyance arm /Lt and /Rt are their home positions.

[1]	Notch of cover paper conveyance arm /Rt	[2]	Pin
[3]	Spring	[4]	Driven roller

[11]	Driven roller	[12]	Notch of cover paper conveyance arm /Lt
[13]	Spring	[14]	Pin
[15]	Cover paper conveyance arm home sensor /Lt (PS43)	-	

- The following table shows the preset angles of the cover paper conveyance arms for each operation.

Operation	Cover paper conveyance arm / Lt [1]	Cover paper conveyance arm / Rt [2]
Home position [1] [2]	+90 degrees	+90 degrees
Cover paper conveyance [3]	-30.4 degrees	-8 degrees
Cover paper alignment, attachment [4]	-29.4 degrees	-7 degrees
Temporary lowering of cover paper table (for book exit belt preparation) [5]	+25.4 degrees	+41.2 degrees
Re-lifting of cover paper table (to receive book) [6]	-14.1 degrees	+15.3 degrees

a075t2c103ca

[1]	Cover paper conveyance arm /Lt	[2]	Cover paper conveyance arm /Rt
[3]	Cover paper conveyance	[4]	Cover paper alignment, attachment
[5]	Temporary lowering of cover paper table (for book exit belt preparation)	[6]	Re-lifting of cover paper table (to receive book)

(2) Control

(a) Cover paper trimming mode

- When detecting that the print start signal turns ON [1], the cover paper conveyance arm motors /Rt (M43) and /Lt (M44) start forward rotating to make the driven rollers provided on the tips of the arms press against the conveyance rollers /Rt and /Lt, and the motors stop [2].
- When the cover paper conveyance motor (M45) stops [3] after conveying the cover paper to the cover paper table, the M43 and M44 start reverse rotation to move the driven rollers away from the paper [4].
- When the cover paper alignment motor (M41) stops [5] after making the arms press against both edges of the cover paper for alignment, the M43 and M44 start forward rotation to press the conveyance rollers /Rt and /Lt with the driven rollers [6] to prevent the paper from moving.
- When the cover paper trimming is finished, the cover paper alignment operation [7] to be attached to the inside papers is performed in the same manner as for the trimming.
- When a prescribed time has elapsed after the cover paper table is lifted [8] by the cover paper table up down motors /Fr (M46) and /Rr (M47), the cover paper folding plates /Rt and /Lt start to move inward to fold the cover paper along the inside papers, and at the same time, the M43 and M44 start reverse rotation to move the driven rollers away from the paper [9].
- When the cover paper table starts temporary lowering to prepare for receiving the book with the M46 and M47 drive forces, the M43 and M44 start reverse rotation [10] to support both sides of the cover paper with the cover paper lift plate /Lt and /Rt. It prevents the cover paper alignment plates /Fr and /Rr from unexpectedly folding the cover paper.
- When the M41 stops [11] after setting the book exit belt /Fr and /Rr at the book receiving position, the cover paper table starts to move upward again, and at the same time, the M43 and M44 start forward rotation to move the arms so that they do not contact with the clamp section.
- When the cover paper table starts downward movement receiving the book, the M43 and M44 drives the arms to return them to the home positions [13].

a075t2e104ca

[1]	Print start signal ON	[2]	Driven rollers are pressed against the conveyance rollers
[3]	Cover paper conveyance is completed	[4]	Release
[5]	Completion of positioning (alignment) cover paper for trimming	[6]	Driven rollers are pressed against the paper

[7]	Positioning (alignment) cover paper to be attached to inside papers	[8]	Starting lifting the cover paper table
[9]	Driven rollers release the paper for cover paper folding operation	[10]	Temporary lowering of the cover paper table
[11]	Book exit belt is set to standby	[12]	Moving the arms to avoid contact with clamp section
[13]	Returning to the home position	-	

(b) Cover paper Not trimming mode

When the sub-scanning direction length of inside papers is over 182mm, the first positioning operation for trimming is not performed. Only the positioning operation for attaching the cover to the inside papers is performed. However, when the inside paper is smaller than B5 size, alignment is done twice. Once when cover paper is carried in, and once after leading edge positioning is done.

8.3.8 Cover paper lifting (supporting) control

(1) Mechanism

- The cover paper lift solenoid (SD41) activates the cover paper lift plate /Rt.
- The cover paper lift plate /Rt supports the right-side of the cover paper to prevent it from bowing down and being unexpectedly folded when the cover paper table is temporary lowered for setting the book exit belt at the standby position.

(2) Control

- When the cover paper table up down motors /Fr (M46) and /Rr (M47) stop after lowering the table for setting the book exit belt at the standby position, the cover paper lift solenoid (SD41) is activated to move the cover paper lift plate for supporting the right-side of the cover paper. This operation prevents the right-side of the paper from bowing.
- The SD41 turns OFF when the cover paper alignment motor (M41) stops after setting the book exit belt at the standby position.

[1]	Supporting cover page with the cover lift plate	[2]	Ending supporting cover paper
-----	---	-----	-------------------------------

8.3.9 Book paper exit control

(1) Mechanism

- The booklet exit motor (M42) drives the book exit belts /Fr and /Rr.

(2) Control

- After the cover paper is folded along the inside papers, the cover paper table up down motors /Fr (M46) and /Rr (M47) start reverse rotation to lower the cover paper table [1].
- When the book spine corner touches the book exit belt surface (when a prescribed time has elapsed after the table starts to go down), the booklet exit motor (M42) starts to rotate at low speed so that the book is slowly laid down on the belt [2].
- When a prescribed time has elapsed after starting the rotation, the M42 stops [3].
- The M42 starts high-speed rotation to exit the book [4] toward the book stock section when the M46 and M47 have moved the cover paper table upward by 60mm so that the book exit belt horizontally aligns with the book conveyance belt in the book stock section.
- The M42 stops [5] when the booklet end sensor (PS61) turns ON detecting that the book has conveyed to the book stock section.

[1]	Cover paper table goes down to convey the book to the belt	[2]	Receiving the book
[3]	Temporary stop	[4]	Paper exit of the book

[5]	Paper exit completed	-
-----	----------------------	---

8.3.10 Waste paper control

- The waste box full sensor (PS80) [1] detects a full status of the waste box by receiving a light reflected off the waste paper in the box.
- The waste box set sensor (PS81) is provided to detect whether the waste box is properly set or not. The actuator of the waste box activates the sensor.

9.3 Operation

9.3.1 Book stock section operation overview

1. When detecting that the print start signal turns ON, the book guides /Fr and /Rr [4] and the book stopper [1] are moved to the positions correspond to the selected paper size.
2. The book conveyance belt [5] is driven in synchronization with the drive of the book exit belt [6] in the cover paper table section, and the conveyance belt receives the book from the exit belt.
3. The book guides /Fr and /Rr [4] are moved to the positions where they contact with the book side edges to align the book.
4. The book is conveyed downward until it reaches to the position to be stacked.
5. The book conveyance arms /Fr and /Rr are opened to drop the book onto the book movement belt /1 [3].

6. When books have been stacked to the upper limit, the stack of books [1] is moved to the second row [4] by the book movement belts /1 [2] and /2 [3], and then it keeps stacking the subsequent books in the first row.

9.3.2 Book conveyance and movement control

(1) Mechanism

- The booklet conveyance belt movement motor (M62) [1] drives the book movement arms /Fr [8] and /Rr [2] via the timing belt [10].
- The book movement arms /Fr and /Rr move in the main scan direction along the guide shaft /Rt [5] and /Lt [9].
- The book conveyance belt movement home sensor (PS62) is provided to detect whether the arms in their home position or not.
- The guide shafts /Fr and /Rr are moved up or down by the booklet conveyance belt up down motor (M63).
- The book movement arms /Fr and /Rr include the book conveyance belts /Fr [6], /Rr [3], and the book guide /Fr [7], /Rr [4].
- Registration regulating plate /Fr [7], /Rr [4] slides along the guide shaft /Rt [5], /Lt [9].

a075t2c116ca

[1]	Booklet conveyance belt movement motor (M62)	[2]	Book movement arm /Rr

[9]	Guide shaft /Lt	[10]	Timing belt
[11]	Book conveyance belt movement home sensor (PS62)	-	

(a) Operation

- When receiving a book from the cover paper table section [1], the book movement arms /Fr [6] and /Rr [11] are moved to the positions correspond to the book size, and the book guides /Fr [7] and /Rr [10] are set at the positions 17mm outer the book edges [9].
- Then the book guides are moved inward to the positions 2mm away from the book edges to align the book to be stacked.
- When the book is conveyed downward to the position to be stacked, the book movement arm /Fr [6] and /Rr [10] are moved outward to drop the book [3].

a075t2c118ca

[5]	Gap between the book edge and the guide is 2mm during alignment	[6]	Book movement arm /Fr
[7]	Book guide /Fr	[8]	Gap between the book edge and the guide is 17mm in the standby status
[9]	Book	[10]	Book guide /Rr
[11]	Book movement arm /Rr	-	

(2) Control

- When detecting that the print start signal turns ON [1], the book conveyance belt movement motor (M62) starts forward rotation to move the book movement arms /Fr and /Rr to the positions correspond to the book size [2].
- When the booklet end sensor (PS61) turns ON [3], the M62 starts forward rotation again to move the regulation plates /Fr and /Rr inward until the gap between the regulation plates and book edges become 2mm to perform alignment [4].

3. When the booklet conveyance belt lower limit sensor (PS64) turns ON [5], the M62 starts reverse rotation to move the arms to home position and stops [6]. However, when there are subsequent books, book conveyance assy moves the book movement arms to standby position after returning to the upper limit home position.
4. After releasing the book, the M62 reverse rotation is continued until the arms stop at their home positions [7] turning ON the book conveyance belt movement home sensor (PS62).

[1] Print start signal ON	[2] Stop the arms at the positions correspond to the book size
[3] Receiving the book is completed	[4] Guides stop at the positions for alignment
[5] Start to move the arms to their standby position	[6] Stopping at the standby position
[7] Returning to the home position	-

9.3.3 Book conveyance belt control

(1) Mechanism

- The booklet conveyance belt motor (M61) drives the book conveyance belt.
- The book conveyance belts /Fr [2] and /Rr [1] receive the book conveyed from the cover paper table section.
- The booklet presses the book end sensor (PS61) [3] and turns it ON. It detects the completion of the receiving operation.

[1] Book conveyance belt /Rr	[2] Book conveyance belt /Fr
[3] Booklet end sensor (PS61)	-

(2) Control

- The booklet conveyance belt motor (M61) starts to drive upon starting of the booklet exit motor (M42) to receive the book [1] conveyed from the cover paper table section.
- The M61 stops [2] when the booklet end sensor (PS61) turns ON.

[1] Book conveyance belt drive	[2] Receiving the book is completed
--------------------------------	-------------------------------------

9.3.4 Book conveyance up down control

(1) Mechanism

- The booklet conveyance assy [5] is moved up and down with the book lift wires /Fr [4] and /Rr [3] driven by the booklet conveyance belt up down motor (M63) [1].
- The booklet conveyance belt home sensor (PS63) [6] detects whether the book conveyance assy is at its upper limit home position or not. The book conveyance belt lower limit sensor (PS64) [2] provided at the bottom of the book movement arm /Rr detects whether the book conveyance assy is at its lower limit position (top surface of the stacked books or the movement belt position).

a15xt2c030ca

[1] Booklet conveyance belt up down motor (M63)	[2] Booklet conveyance belt lower limit sensor (PS64)
[3] Book lift wire /Rr	[4] Book lift wire /Rr Book lift wire /Fr
[5] Book conveyance assy	[6] Booklet conveyance belt home sensor (PS63)

(2) Control

- When the book alignment driven by the booklet conveyance belt movement motor (M62) is finished, the booklet conveyance belt up down motor (M63) starts forward rotation to lower the book conveyance assy [1].
- M63 stops when the booklet conveyance belt lower limit sensor (PS64) turns ON [2].
- When the M62 stops [3], the M63 starts reverse rotation to lift the book conveyance assy.
- The M63 stops [4] when the book conveyance belt home sensor (PS63) detects that the assy reaches its upper home position.

a075t2e123ca

[1] Book conveyance assy starts to go down	[2] Stopping at the book release position
[3] Releasing book is completed	[4] Returning to the home position

9.3.5 Book movement control

(1) Mechanism

- The booklet movement motor (M64) [1] drives the book movement belts /1 [2] and /2 [3].
- It moves the books of the first row stacked on the book movement belt /1 to the book movement belt /2 of the second row.
- The shielding plate [5] of the actuator [4] on the handcart turns ON the booklet sensor /2 (PS67) [6] and detects whether there is any book stacking on the second row.

a15xt2c031ca

[1] Booklet conveyance belt movement motor (M64)	[2] Book movement belt /1
[3] Book movement belt /2	[4] Actuator

[5] Shielding plate	[6] Booklet sensor /2 (PS67)
[7] Cart set sensor (PS69)	[8] Hand cart set switch (MS2)

(2) Control

(a) While in the print

- The booklet movement motor (M64) is allowed to drive only when the booklet sensor /2 (PS67) is OFF (no stack of books exist at the second row).
- It allows the driving of M64 only when the cart set sensor (PS69) and the hand cart set switch (MS2) are ON.
- When the booklet load limit sensor (PS65) detects that book has been stacked up to the limit at the first row, the M64 starts to drive the belt and stops after the specified period of time when the PS67 turns ON.

(b) Book manual movement

- The booklet movement motor (M64) is allowed to drive only when the booklet sensor /1 (PS66) is ON and the booklet sensor /2 (PS67) is OFF.
- It allows the driving of M64 only when the cart set sensor (PS69) and the hand cart set switch (MS2) are ON.
- It drives the M64 with turning ON the book movement button and stops after the specified period of time when the PS67 turns ON.

9.3.6 Book stopper control

(1) Mechanism

- The book stopper supports the stacked books to prevent them from falling down.
- The booklet stopper motor (M65) drives the book stopper.
- The booklet stopper HP sensor (PS68) detects whether the book stopper is at is home position or not.

(2) Control

- Upon receiving of a print job, the booklet stopper motor (M65) starts forward rotation to move the stopper to the position correspond to the book size.
- When the job is finished, the M65 starts reverse rotation to return the stopper to its home position, and the motor stops when the booklet stopper HP sensor (PS68) turns ON.

9.3.7 Book full status detection control

- When books have been stacked up to the limit at the first row, the full-status is detected by the booklet load limit sensor (PS65) and notified by the booklet upper limit LED (LED61).
- Since any light to the PS65 is blocked while the book conveyance assy is moving up or down, the PS65 status is checked only while the book conveyance belt home sensor (PS63) is ON.
- Even when the PS65 is not detecting the full-status, continuing stacking books cannot be made under the following conditions.

(1) When the stacked book size is the same

- Book thickness is classified into 3 levels; a, b, and c, and allowable number of books to be stacked is determined according to the combination of a, b, and c as shown in the following table.
 - Book a: 10 to 30 sheets
 - Book b: 31 to 150 sheets
 - Book c: 151 to 300 sheets
- Mixing more than 2 among a, b, and c-level books in 1 stack is not allowed.

Books already stacked	Books to be stacked over		
	Book a	Book b	Book c
Book a	50 copies in total	(30 - a)	(20 - a)
Book b	(35 - b) until detected by PS65	35 copies in total or until detected by PS65	(20 - b) copies or until detected by PS65
Book c	Until detected by PS65	Until detected by PS65	Until detected by PS65

*Stacking more books is stopped when the result of the calculations shown in the table become negative value.

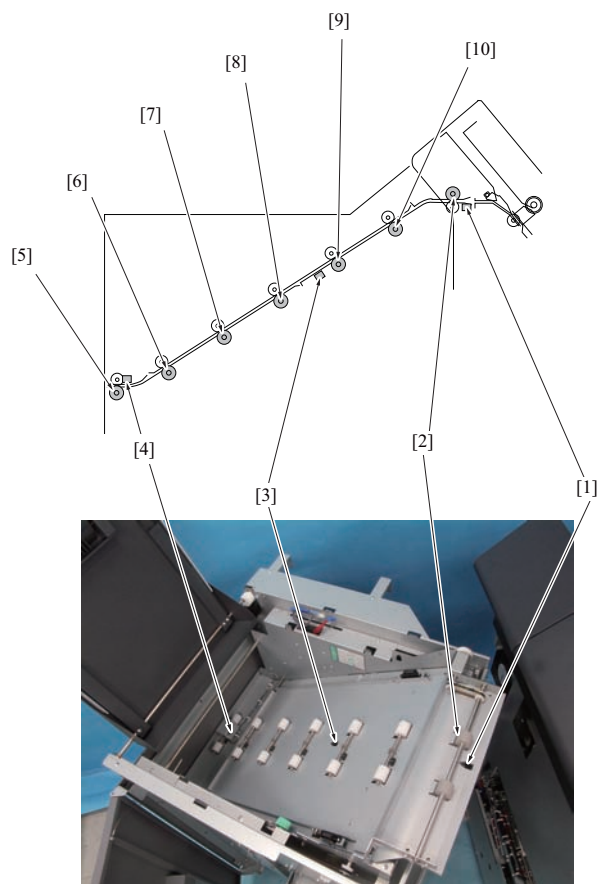

*Stacking more books is stopped when the PS65 detects full status even when the result of the calculations is positive.

(2) When the stacked book size is different from each other

- It moves the stacked books on the first row to the second row, and then stacks the different size books on the open first row. When the handcart is not set, bookbinding is stopped.

10. RELAY CONVEYANCE SECTION

10.1 Configuration

a15xt2c032ca

[1]	Relay conveyance entrance sensor (PS93)	[2]	Relay conveyance roller /1

[7] Relay conveyance paper exit motor (M91)	[8] Relay paper exit roller /1
[9] Relay paper exit roller /2	-

10.3 Operation

10.3.1 Relay conveyance control

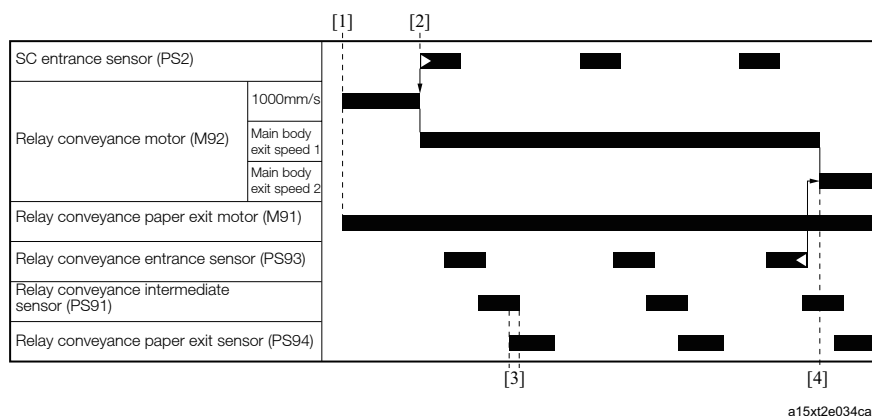

(1) Mechanism

- The relay conveyance motor (M92) switches the relay conveyance rollers /1, /2, /3, /4 and /5 between 1000mm/s and the speed of the main body paper exit, and drives them. *1
- The relay conveyance exit motor (M91) drives the relay paper exit rollers /1 and /2 at the constant speed 1000mm/s.
- The relay conveyance rollers /3 and /5 have the one-way clutch and it applies for the paper pulling out by the relay conveyance paper exit rollers /1 and /2.

*1 The speed is switched only for 1051. For C8000/1200/1200P/1250/1250P/C7000/C7000P/C70hc/C6000, the speed is kept at 1000mm/s and not switched.

(2) Control

- Upon receiving a print job, the relay conveyance motor (M92) and the relay conveyance exit motor (M91) turn ON [1] at the speed 1000mm/s.
- Once the SC entrance sensor (PS2) turns ON and detects the leading edge, M92 decelerates to the speed of the main body paper exit [2].
- During the period [3] between when the relay conveyance exit sensor (PS94) turns ON and the relay conveyance intermediate sensor (PS91) turns OFF, the relay paper exit rollers /2 and /1 pull and convey the paper from the relay conveyance roller.
- If the speed of the main body paper exit for the next paper changes, it switches to the speed of it [4] after a specified period of time since the relay conveyance entrance sensor (PS93) turns OFF and detects the trailing edge of paper.

a15xt2e034ca

[1] Print start signal ON	[2] Decelerates to the speed of main body paper exit

11.1 Fan control

a15xt2c035ca

[1]	Pellet supply cooling fan (FM4)	[2]	Exhaust fan /2 (FM81)
[3]	Exhaust fan /1 (FM80)	[4]	Deodorant fan /2 (FM98)
[5]	Deodorant fan /1 (FM97)	-	

11.1.1

(1) Pellet supply cooling fan (FM4)

(a) Purpose

- The fan cools the air above the molten glue surface in the glue tank for the maintenance of a temperature differential to molten glue. This allows the glue tank temperature sensor /Up (TH2) to detect a drop in temperature precisely when it comes out of the molten glue that is getting low for the notification that pellets need to be supplied.

(b) ON timing

- The M4 turns ON upon completion of warm-up of the glue tank.
- The M4 turns ON when the temperature sensor /Md (TH3) detects the temperature around the middle in the glue tank is higher than the preset temperature.

(c) OFF timing

- The M4 turns OFF when the temperature sensor /Md (TH3) detects the temperature around the middle in the glue tank is lower than the preset temperature.

(2) Exhaust fan /1 (FM80), /2 (FM81)

(a) Purpose

- The fans are provided to prevent an excessive increase in temperature inside the PB-501 exhausting air and deodorize.

(b) ON timing

- The FM80 and FM81 turn ON upon completion of warm-up of the glue tank.
- The FM80 and FM81 turn ON when the temperature sensor /Md (TH3) detects the temperature around the middle in the glue tank is higher than the preset temperature.

(c) OFF timing

- The FM80 and FM81 turn OFF when the temperature sensor /Md (TH3) detects the temperature around the middle in the glue tank is lower than the preset temperature.

(3) Deodorant fan /1 (FM97), /2 (FM98)

(a) Purpose

- Exhausts air from the exhaust fans /1 (FM80) and /2 (FM81) to the outside through the deodorant filter.

(b) ON timing

- Turns ON FM97 and FM98 with turning ON the sub power switch (SW2) of the main body.

(c) OFF timing

- Turns OFF FM97 and FM98 with turning OFF the sub power switch (SW2) of the main body.

11.2 Door opening/closing control

- When the front door, upper door and the book door are open and the front door switch (SW2) [2], the upper door switch /2 (SW4) [1] and the booklet door switch (SW3) [5] turn OFF, the DC power supply unit /2 (DCPU/2) is shut down to stop all operations instantly.
- When the pellet supply door is opened with the pellet supply door switch (MS1) turned OFF, the pellet supply motor (M33) is stopped instantly.

- During initialization and printing operations, the front door lock solenoid (SD80) [3], booklet door lock solenoid (SD61) [6] turn ON, and disables the front door and the book door to open/close. During idling, jam occurrence or in service mode, SD80 and SD61 turn OFF and open/close of the front door is enabled.
- A message is displayed in the touch panel when the booklet door sensor (PS57) [4], upper door switch /1 (SW1) [9], and relay conveyance door sensor (PS92) [8] switch from ON to OFF.
- When the relay conveyance door is opened with the relay door switch (MS3) [7] turned OFF, the relay conveyance motor (M92) and the relay conveyance exit motor (M91) are stopped instantly.

PR THEORY OF OPERATION GP-501

1. PREFACE

1.1 INTRODUCTION

This service manual is provided for use by an authorized service technician for the repair and maintenance of the GP-501 Punch.

The GP-501 Punch is an innovative, labor saving solution for punching paper in-line and includes the following design features:

- Maximum productivity saver with punching in-line at the speed of the printer! Does not slow up or stop the print system.
- Quick-change die sets that are self-latching without tools or levers.
- GP-501 Punch die sets are available in all of the most common hole patterns and include an Identifying Label providing user with the hole pattern and name.
- Convenient storage area for three extra Die Sets located above the sheet bypass.
- Accurate hole punching with consistent alignment.

With each GP-501 Punch, the customer receives a user manual. They are encouraged to keep this manual for future reference.

The information contained in the user manual is also helpful to the service technician.

Please refer to it for detailed information regarding dies sets, operation or specifications.

1.1.1 Setting the Right Expectations

The following excerpts are copied from sales and marketing literature. This customer expectation information is helpful for the service technician.

1.2 PRODUCT POSITIONING

The GP-501 Punch provides a flexible, cost effective punching solution for light to medium level production oriented customers.

- Designed for customers that have the need to punch their documents at a maximum of 60-70% of their overall workflow.
- Recommended punching limit to 200K sheets per month. (600k sheets in bypass mode)
- Die Sets will decrease in performance over time based on the types of stocks and weights that are being punched.
- The expected life of a dieset is 500K punches. However, if paper stock punched is typically 20 lb. bond, then up to 2 million punches can be achieved.
- Should be regarded as a long-term supply item.

1.3 LONG EDGE FEED (LEF) ONLY

The GP-501 Punch is designed to punch LEF only. No exceptions. Attempting to punch a sheet size other than LEF will cause a misfeed.

- Use a colored sheet insert (instead of the tab) in the job workflow for easier tab insertion after the job has been run.

2. OUTLINE

3.1 Configuration

[1]	Diverter	[2]	Aligner Panel
[3]	Punch Module	[4]	Back Gauge Mechanism
[5]	Bypass Assembly	-	

4. PRINCIPLE OF OPERATION

4.1 Punch conveyance control

The GP-501 Punch is a machine that punches various die set hole patterns into single sheets of paper. The machine is placed between a printer and a finisher. The punch has two paper paths.

- The punch mode
- The bypass mode

The bypass moves the paper from the printer to the finisher without punching holes. The punch path routes the paper from the printer through the punch to be punched and then routes the paper to the finisher.

1. Communication system alerts the punch machine of the paper entry from the up-stream device.
On receiving the 40 command, AC motors and stepper motor turns on. Diverter gate moves to up position.
2. The paper enters the punch machine through entrance feed section
3. Enter sensor (S1) detects paper and acknowledges transfer of sheet from up-stream device
4. Paper passes through entry guide. Stepper 1 speed sensor (S2) is provided to detect paper jam.
Entrance stepper motor RPM increases to accelerate sheet to aligner path. After trailing edge of sheet leaves S2, entrance stepper motor slows down in preparation for next sheet.
5. Paper enters aligner panel. Entrance stepper motor accelerates to match sheet speed with aligner speed. Paper is edge aligned in preparation for punch.
6. Back gauge solenoid is energized and back gauge pedal blocks the paper path. Sheet arrives at Punch module sensor (S3). Punch module brake disengages and Punch clutch engages. After Punch clutch is engaged punch shaft begin to rotate. Paper punching is done. Leading edge of flag leaves Punch flag sensor (S9). Then Punch module brake engages and back gauge gate comes down. Trailing edge of sheet unblocks S3 and back gauge pedal comes up.
7. Paper passes through U-channel. U-channel sensor (S4) and Back gauge sensor (S5) are provided to detect any paper jam
8. Stepper 2 speed sensor (S6) detects paper and triggers exit stepper motor for speed which decelerates sheet
9. Exit sensor (S7) detects paper and determines the paper has passed through completely for other operation or for stacking purpose

[1] Diverter	[2] Aligner Panels
[3] U-Channel	[4] Stepper 1 Speed Sensor (S2)
[5] Punch Module Sensor (S3)	[6] U-Channel Sensor (S4)
[7] Back Gauge Sensor (S5)	[8] Stepper 2 Speed Sensor(S6)
[9] Exit Sensor (S7)	[10] Aligner Drive Belt

[1]	Entrance Stepper Motor	[2]	Exit Stepper Motor
[3]	Punch Motor	[4]	Transport Motor
[5]	Back Gauge Solenoid	-	

4.2 Punch operation

1. Punch motor (AC motor) rotates continually after receiving start command from printer.
2. Belt turns continually when motor is powered.
3. Punch clutch (Electromagnetic 24V DC clutch) when energized connects Punch motor to the punch mechanism which transmits power.
4. Belt only turns when Punch clutch is energized.
5. Punch module brake is a 24V DC electromagnetic type and is energized when the Punch clutch is not powered.

Punching Operation - Back gauge solenoid is energized and back gauge pedal blocks the paper path. Sheet arrives at Punch module sensor (S3). Punch module brake disengages and Punch clutch engages. After clutch is engaged punch shaft begin to rotate. Paper punching is done through cam mechanism which pushes the pins forward. Leading edge of flag leaves flag sensor. Punch module brake engages and back gauge gate comes down. Trailing edge of sheet unblocks S3 and back gauge pedal comes up.

4.3 Chip tray control

Chip tray switch determines when chip tray is present and informs GP-501 processor that chip tray is present. A signal voltage is communicated to Punch Controller PCB. If the chip tray is pulled out GP-501 processor notifies printer that chip tray is out. Printer will show the error message on the screen.

Chip tray full occurs after 5000 punches or is detected by Chip tray full sensor. Clear occurs when chip tray is removed to empty the bin and GP-501 is powered on.

4.4 Bypass conveyance control

1. Communication system alerts the punch machine of the paper entry from the up-stream device.
Motor starts on receiving 40 command from printer, diverter solenoid goes 'ON' on receiving 15 command from printer.
2. Diverter gate remains in closed position
3. Enter sensor (S1) detects paper and acknowledges transfer of sheet from up-stream device
4. Bypass sensor (S8) is provided in bypass panel to detect jam
5. Exit sensor (S7) detects paper and determines the paper has passed through completely for other operation or for stacking purpose

[1]	Enter Sensor (S1)	[2]	Bypass Sensor (S8)
[3]	Exit Sensor (S7)	[4]	Bypass Panel
[5]	Entrance Roller	[6]	Intermediate Roller
[7]	Exit Roller	[8]	Diverter

[1]	Divert Solenoid	[2]	Entrance Roller
[3]	Intermediate Roller	[4]	Exit Roller
[5]	Entrance Stepper Motor	[6]	Exit Stepper Motor

5. PUNCH MODULE

5.1 Tools Required

- Phillips screw driver or 1/4" nut driver
- Hex wrench, 5/64"

NOTE

- Empty the paper chip bin and replace it. This makes it easier to find small parts that you may drop into the bin.

5.2 Procedure

Remove the module to lubricate the cams, or to service or replace the following components.

- Punch motor
- Drive motor belt
- Punch module brake
- Cams
- Flexible drive coupling
- Punch Module drive rollers

The clutch can be replaced without removing the module. (refer to [F.21.3.36 Punch Clutch Replacement](#)).

WARNING

- Disconnect the GP-501 Punch from its power source before removing the Back Gauge assembly. Failure to observe this warning can result in severe injury or death and damage the punch.

PS THEORY OF OPERATION GP-502

1. THEORY OF OPERATION

The descriptions of the theory of operation GP-502 are mentioned in the GP-502 service manual.

PT THEORY OF OPERATION IC UNIT

1. SYSTEM CONTROL SECTION

1.1 Configuration

[1]	DIMM socket (slot A and slot B) (slot B is for extension, not scheduled yet)	[2]	SATA connector for HDD
[3]	Power connector for HDD	[4]	Cooling fin for the chipset
[5]	Connector for BOX cooling fan	[6]	USB port for USB print (Type B)
[7]	USB port for service (Type A)	[8]	Battery
[9]	RJ45 Ethernet connector for the network print	[10]	Half slim type SSD for saving the firmware
[11]	RS-232C serial port for service	[12]	Socket for UK-205 (One at the lower side is for extension, not scheduled yet)
[13]	EEPROM for storing HDD password.	[14]	Connector for CPU cooling fan
[15]	CPU cooling fan	[16]	CPU (LGA1155 socket)

Q IMAGE POSITION ADJUSTMENT

1. UNDERSTANDING THE CHARACTER OF THE PAPER

1.1 The shrinkage of the paper

- The storage condition affects the paper shrinkage, so be careful when storing papers.
- The shrinkage of the paper that passed the fusing section is affected by the paper type, brand, weight, lot, the operating environment, and the storage environment. Particularly, the paper shrinkage is more likely to be affected in the vertical direction to the grain direction.
- The shape of the paper changes depending on how much time elapses immediately after the paper passes the fusing section and is exited.

1.2 The dimensional accuracy of the paper

- ISO216 defines the dimensional tolerance, and both the Side1 and Side2 adjustments must be conducted for each paper.

Dimensions	Dimensional tolerance
150mm or less	±1.5 mm
More than 150mm, less than 600mm	+/- 2mm

- The paper leading edges that is referred for the image positioning are opposite between Side1 and Side2, so it is important that both the leading and trailing edges are parallel in the conveyance direction.
- The reference position for centering is a side at the front side of the main body, so it is important that both the leading and trailing edges are perpendicular to the side at the front side of the main body.
- The outer diameter of the paper is referred for the image writing, so the variability among the paper outer diameters directly affects the accuracy of the image positioning. Particularly, the accuracy of the image position is significantly affected by the following items: the parallelism between the paper length in the sub scan direction and the paper leading and trailing edges; the squareness between the paper leading and trailing edges and the paper side at the front side of the main body

1.3 Precautions on supplying papers

- When the image writing position is misaligned at every 500 sheets or 1,000 sheets, check the following items.
- When stacking the paper on the tray, check if there is any damage on the upper and lower papers of the paper package.
- When the paper package is changed, stack it in the same direction as for the former paper package.

Note

- **When the papers are trimmed in the same procedure for each paper package, align them in the same direction so that the shapes of the outer diameters are precisely aligned**
- **However, if there are different tendencies with the paper shapes for each paper package, the image writing position could be misaligned.**

2. BASIC OPERATION

2.1 Both sides adjustment (Preparation)

2.1.1 Preparation for papers

- Be sure to prepare for papers in the same temperature and humidity in accordance with the operating environment.
- If the paper does not suit the operating environment, the paper is likely to be curled due to the condensation and the drastic change in the moisture content. For instance, if the installation location is at the high temperature while the paper to be used is stored in the normal temperature and humidity, the condensation could occur depending on the difference in temperature.

Note

- In order to prevent the moisture absorption, be sure not to store papers in the high temperature environment.
- For the recommended requirements for the papers that are used for the Side1 and Side2 position adjustment, refer to the following chart.

Item	Recommended requirements
Paper Size	210mm or longer in the main scan direction, 200mm or longer in the sub scan direction, and the ratio between the paper length in the main scan direction and the paper length in the sub scan direction is within 1:2
	The variability among the paper lengths in the sub scan direction is $3\sigma \leq 0.2 \text{ mm}$
	The grain direction is vertical to the paper feed direction.
Others	The trimming is performed collectively, and the squareness (parallelism) at the paper leading and trailing edges is 0.2mm or less.
	The operating environment is limited to Q zone, and the same environment is applied to the paper storage.

2.1.2 About the adjustment procedure

The adjustment is conducted in the following order.

Note

- As a prerequisite, the position adjustment for the Side1 (Simplex) must be completed.

Classification	Description	Remark
Mechanical adjustment	Skew adjustment	
	Distortion adjustment	Only when required
Software adjustment	Printer Restart Timing Adjustment(Side2) rough adjustment	
	Printer FD-Mag. Adj.(Side2)	
	Printer Restart Timing Adjustment (Side2)	
	Printer CD-Mag. Adjustment (Side2)	
	Both Sides Adj. Image Shift for the upper and lower (Side2)	

2.2 Both sides adjustment (Mechanical adjustment)

2.2.1 Skew adjustment

(1) Purpose

- In order to match the skews of the lines in the sub scan direction between Side1 and Side2, conduct the mechanical adjustment of the registration unit.
- Print the test pattern No.16 to check the skew.

Note

- When the line in the sub scan direction skews at the trailing edge, it is possible that the positions of the transfer belt and fusing unit are skewed.

[1]	Line in the sub scan direction	[2]	Exited paper trailing edge
[3]	The front side of the main body	[4]	Exited paper leading edge
[5]	The back side of the main body	-	

(2) Preparation

1. Print the test pattern No.16, and check the skew.
2. Pull out the duplex section from the main body. (Refer to [F.5.9.1 Pulling out/reinstalling the duplex section](#))
3. Loosen 5 screws [2] of the registration unit [1].

(3) Adjustment procedure

- (a) When Side1 and Side2 are positioned as described in the following chart

[1]	Exited paper trailing edge	[2]	The front side of the main body
[3]	Exited paper leading edge	[4]	The back side of the main body
[5]	The image on Side1	[6]	The image on Side2

1. Move the back side [1] of the registration unit to the transfer belt side [2].

2. Tighten 5 screws [2] of the registration unit [1].

(b) When the positions of Side1 and Side2 are as described in the following chart

[1]	Exited paper trailing edge	[2]	The front side of the main body
[3]	Exited paper leading edge	[4]	The back side of the main body
[5]	The image on Side1	[6]	The image on Side2

1. Move the back side [1] of the registration unit to the paper feed side [2].

2. Tighten 5 screws [2] of the registration unit [1].

2.2.2 Distortion adjustment

(1) The prerequisites for the adjustment

- "Q.2.2.1 Skew adjustment" is completed, and the lines in the sub scan direction at Side1 and Side2 match each other.
- When the lines in the main scan direction at Side1 and Side2 are located as follows, the leading and trailing edges of the paper that is used are not parallel.
- The mechanical adjustment of the registration unit cannot adjust the line in the main scan direction.

[1]	Exited paper trailing edge	[2]	The front side of the main body
[3]	Exited paper leading edge	[4]	The back side of the main body
[5]	The image on Side1	[6]	The image on Side2
[7]	Line in the main scan direction	-	

(2) Purpose

- When the lines in the sub scan direction at Side1 and Side2 must match each other, conduct the mechanical adjustment of the LPH. However, please note that there are some precautions for performing the adjustment.
- For the mechanical adjustment of the LPH, print the test pattern No.16.

Note

- The mechanical adjustment of the LPH significantly affects the image formation (the deterioration of the image quality etc...).** Therefore, do not conduct this adjustment basically.
- The misalignment of the lines in the main scan direction at Side1 and Side2 is mainly affected by the outer diameter of the paper. Therefore, even the mechanical adjustment of the LPH cannot adjust the lines.**
- When the tilt occurs, do not conduct the LPH adjustment. The paper that has the accurate outline is recommended to be used.**
- Originally, the mechanical adjustment of the LPH is performed by the skew adjustment. Therefore, be careful for the skew of the image when adjusting**

(3) Preparation

- Print the test pattern No.16 and check the skew
- Remove the LPH unit. (Refer to [F.5.3.6 Cleaning the LPH lens](#))
- Loosen 2 screws [2] at the LPH support section /Rr [1].

- (4) Adjustment procedure
- (a) When the positions of Side1 and Side2 are as described in the following chart

[1]	Exited paper trailing edge	[2]	The front side of the main body
[3]	Exited paper leading edge	[4]	The back side of the main body
[5]	The image on Side1	[6]	The image on Side2

1. Move the metal plate [1] of the LPH support section to the developing unit side [2].
- Note**
- The adjustment must be performed within ± 1 divisions of the scale. If the adjustment is performed too much, the focal distance changes so that the image skew and the out of focus possibly occur.
1 division: 0.5mm

2. Tighten 2 screws [2] at the LPH support section /Rr [1].

(b) When the positions of Side1 and Side2 are as described in the following chart

[1]	Exited paper trailing edge	[2]	The front side of the main body
[3]	Exited paper leading edge	[4]	The back side of the main body
[5]	The image on Side1	[6]	The image on Side2

1. Move the metal plate [1] of the LPH support section to the drum side [2].

Note

- The adjustment must be performed within ± 1 divisions of the scale. If the adjustment is performed too much, the focal distance changes so that the image skew and the out of focus possibly occur.
1 division : 0.5mm

2. Tighten 2 screws [2] at the LPH support section /Rr [1].

2.3 Both sides adjustment (Software adjustment)

2.3.1 Printer Restart Timing Adjustment(Side2) rough adjustment

- (1) Purpose
- Roughly align the position of the line [4] in the main scan direction at the trailing edge side on Side2 with reference to Side1.
 - Print the test pattern No.16 to check the line in the main scan direction at the trailing edge side.
 - This adjustment is performed by conducting "Printer Restart Timing Adjustment (Side2)" in the service mode.

[1]	Exited paper trailing edge	[2]	The front side of the main body
[3]	Exited paper leading edge	[4]	The line in the main scan direction at the leading edge side
[5]	The back side of the main body	-	

- Note
- The both side adjustment (software adjustment) ("Printer Restart Timing Adjustment(Side2) rough adjustment", "Printer FD-Mag. Adj.(Side2)", "Printer Restart Timing Adjustment (Side2)", "Printer CD-Mag. Adj. (Side2)", "Both Sides Adj.: Image Shift for the upper and lower (Side2)") must be conducted repeatedly until the image moves to the appropriate position.
 - The variability among the image positions occurs depending on the paper condition, so the test pattern for the confirmation is recommended to be printed on the several sheets.

(2) Adjustment procedure**(a) When Side1 and Side2 are positioned as described in the following chart**

[1]	Exited paper trailing edge	[2]	The front side of the main body
[3]	Exited paper leading edge	[4]	The back side of the main body
[5]	The image on Side1	[6]	The image on Side2

- By conducting "Printer Restart Timing Adjustment (Side2)" of the service mode, adjust the offset value of the tray to be adjusted by 1 step to the positive side.
 - Default setting = 0
 - 1 step = 0.1mm

(b) When the positions of Side1 and Side2 are as described in the following chart

[1]	Exited paper trailing edge	[2]	The front side of the main body
[3]	Exited paper leading edge	[4]	The back side of the main body
[5]	The image on Side1	[6]	The image on Side2

- By conducting "Printer Restart Timing Adjustment (Side2)" of the service mode, adjust the offset value of the tray to be adjusted by 1 step to the negative side.
 - Default setting = 0
 - 1 step = 0.1mm

2.3.2 Printer FD-Mag. Adj.(Side2)**(1) Purpose**

- Align the position of the line [1] in the main scan direction at the leading and trailing edge sides at Side2 with reference to Side1.
- Print the test pattern No.16 to check the line in the main scan direction at the leading and trailing edge sides.
- This adjustment is performed by conducting "Printer FD-Mag. Adj.(Side2)" in the service mode.

[1]	The line in the main scan direction at the leading and trailing edges	[2]	Exited paper trailing edge
[3]	The front side of the main body	[4]	Exited paper leading edge
[5]	The back side of the main body	-	

- Note**
- The both side adjustment (software adjustment) ("Printer Restart Timing Adjustment(Side2) rough adjustment", "Printer FD-Mag. Adj.(Side2)", "Printer Restart Timing Adjustment (Side2)", "Printer CD-Mag. Adj. (Side2)", "Both Sides Adj.: Image Shift for the upper and lower (Side2)") must be conducted repeatedly until the image moves to the appropriate position.
 - The variability among the image positions occurs depending on the paper condition, so the test pattern for the confirmation is recommended to be printed in the several sheets.

(2) Adjustment procedure

(a) When Side1 and Side2 are positioned as described in the following chart

[1]	Exited paper trailing edge	[2]	The front side of the main body
[3]	Exited paper leading edge	[4]	The back side of the main body
[5]	The image on Side1	[6]	The image on Side2

1. By conducting "Printer FD-Mag. Adj.(Side2)" of the service mode, adjust the offset value of the tray to be adjusted by 1 step to the positive side.
- Default setting = -4
 - 1 step = 0.05 %

(b) When the positions of Side1 and Side2 are as described in the following chart

[1]	Exited paper trailing edge	[2]	The front side of the main body
[3]	Exited paper leading edge	[4]	The back side of the main body
[5]	The image on Side1	[6]	The image on Side2

- By conducting "Printer FD-Mag. Adj.(Side2)" of the service mode, adjust the offset value of the tray to be adjusted by 1 step to the negative side.

- Default setting = -4
- 1 step = 0.05 %

2.3.3 Printer Restart Timing Adjustment (Side2)**(1) Purpose**

- After "Q.2.3.2 Printer FD-Mag. Adj.(Side2)" is conducted, the position of the line in the main scan direction at Side2 shift, so conduct "Printer Restart Timing Adjustment (Side2)" again.
- The adjustment procedure is the same as "Q.2.3.1 Printer Restart Timing Adjustment(Side2) rough adjustment".

Note

- The both side adjustment (software adjustment) ("Printer Restart Timing Adjustment(Side2) rough adjustment", "Printer FD-Mag. Adj.(Side2)", "Printer Restart Timing Adjustment (Side2)", "Printer CD-Mag. Adj. (Side2)", "Both Sides Adj.: Image Shift for the upper and lower (Side2)") must be conducted repeatedly until the image moves to the appropriate position.
- The variability among the image positions occurs depending on the paper condition, so the test pattern for the confirmation is recommended to be printed on the several sheets.

2.3.4 Printer CD-Mag. Adjustment (Side2)**(1) Purpose**

- Align the position of the lines [1] in the sub scan direction at the front and back side at Side2 with reference to Side1.
- Print the test pattern No.16 to check the lines in the sub scan direction at the front and back side.
- This adjustment is performed by conducting "Printer CD-Mag. Adjustment (Side2)" in the service mode.

[1]	The lines in the sub scan direction at the front and back side	[2]	Exited paper trailing edge
[3]	The front side of the main body	[4]	Exited paper trailing edge
[5]	The back side of the main body	-	

Note

- The both side adjustment (software adjustment) ("Printer Restart Timing Adjustment(Side2) rough adjustment", "Printer FD-Mag. Adj.(Side2)", "Printer Restart Timing Adjustment (Side2)", "Printer CD-Mag. Adj. (Side2)", "Both Sides Adj.: Image Shift for the upper and lower (Side2)") must be conducted repeatedly until the image moves to the appropriate position.
- The variability among the image positions occurs depending on the paper condition, so the test pattern for the confirmation is recommended to be printed in the several sheets.

(2) Adjustment procedure

(a) When Side1 and Side2 are positioned as described in the following chart

[1]	Exited paper trailing edge	[2]	The front side of the main body
[3]	Exited paper trailing edge	[4]	The back side of the main body
[5]	The image on Side1	[6]	The image on Side2

- By conducting "Printer CD-Mag. Adjustment (Side2)" of the service mode, adjust the offset value of the tray to be adjusted by 1 step to the positive side.
 - Default setting = -4(951), -2(1250/1250P/1052)
 - 1 step = 0.05 %

(b) When the positions of Side1 and Side2 are as described in the following chart

[1]	Exited paper trailing edge	[2]	The front side of the main body
[3]	Exited paper trailing edge	[4]	The back side of the main body
[5]	The image on Side1	[6]	The image on Side2

- By conducting "Printer CD-Mag. Adjustment (Side2)" of the service mode, adjust the offset value of the tray to be adjusted by 1 step to the negative side.
 - Default setting = -4(951), -2(1250/1250P/1052)
 - 1 step = 0.05 %

2.3.5 Both Sides Adj. Image Shift for the upper and lower (Side2)**(1) Purpose**

- Align the position of the lines in the sub scan direction at the front side at Side2 with reference to Side1.
- Side1 and Side2 cannot be adjusted respectively with "Printer Centering Adjustment" in the service mode. Therefore, print the image that can be judged to have the image centering on the PC, and adjust it by the image shift function.

Note

- The positions of Side1 and Side2 can be confirmed with the test pattern No.16, but the image shift cannot adjust the inside pattern image.
- The both side adjustment (software adjustment) ("Printer Restart Timing Adjustment(Side2) rough adjustment", "Printer FD-Mag. Adj.(Side2)", "Printer Restart Timing Adjustment (Side2)", "Printer CD-Mag. Adj. (Side2)", "Both Sides Adj.: Image Shift for the upper and lower (Side2)") must be conducted repeatedly until the image moves to the appropriate position.
- The variability among the image positions occurs depending on the paper condition, so the test pattern for the confirmation is recommended to be printed on the several sheets.

(2) Adjustment procedure

(a) When Side1 and Side2 are positioned as described in the following chart

[1]	Exited paper trailing edge	[2]	The front side of the main body
[3]	Exited paper leading edge	[4]	The back side of the main body
[5]	The image on Side1	[6]	The image on Side2

1. From [Tray Setting] - [Both Sides Adj.], select the [Back] tab.
2. Adjust by 1 step to the positive side with reference to [Up/Down] of [Image Shift] of the tray to be adjusted.
 - Default setting = 0
 - 1 step = 0.1mm

(b) When Side1 and Side2 are positioned as described in the following chart

[1]	Exited paper trailing edge	[2]	The front side of the main body
[3]	Exited paper leading edge	[4]	The back side of the main body
[5]	The image on Side1	[6]	The image on Side2

1. From [Tray Setting] - [Both Sides Adj.], select the [Back] tab.
2. Adjust by 1 step to the negative side with reference to [Up/Down] of [Image Shift] of the tray to be adjusted.
 - Default setting = 0
 - 1 step = 0.1mm

2.4 About the Both Sides Adj.

2.4.1 About "4 Both Sides Adjust" in "User's Guide POD Administrator's Reference" and "I8.2.6 The front and back registration by user (by paper brand) (front and back registration)" in Service Manual

The adjustment value that is specified in the user mode is to be added to the value in the service mode ("[Q.2.3.1 Printer Restart Timing Adjustment\(Side2\) rough adjustment](#)" to "[Q.2.3.4 Printer CD-Mag. Adjustment \(Side2\)](#)") for determining the image position. After adjusting the value in the service mode, it is recommended to finely adjust the value in the user mode by Both Side Adjust.

2.4.2 About the adjustment procedure of "5.2 01 Machine Adjustment" in "User's Guide POD Administrator's Reference".

This adjustment is same as the one in the service mode ("[Q.2.3.1 Printer Restart Timing Adjustment\(Side2\) rough adjustment](#)" to "[Q.2.3.4 Printer CD-Mag. Adjustment \(Side2\)](#)"). It can be adjusted not only in the service mode, but also in the user mode.

2.5 About the line speed adjustment

When the transfer belt speed, registration line speed, and fusing speed are significantly misaligned, it could vary the leading edge timing and vertical magnification as well as the transfer jitter occurs. In this case, the transfer jitter adjustment must be conducted. (Refer to "[I.8.2.10 Transfer jitter adjustment](#)")

2.6 About the transfer belt

Depending on the environment where the transfer belt is used, the belt tension could loosen so that the variability of the vertical magnification could increase. In this case, conduct the following adjustment in "[I.5.3.3 Transfer Belt Speed Adj. \(Magnification Adjustment\)](#)" and increase the transfer belt speed to improve the symptom.

1. Set the line speed to 1 step positive side from current value and select the test pattern [No.9].
2. Repeat this step until the 60mm pitch unevenness and the transfer jitter do not occur.

Note

- Depending on the paper that is used, the 60mm pitch unevenness and the transfer jitter occurs in different values.

2.7 Adjustment mode

- In the adjustment mode, the black band for preventing the toner deterioration is not created. Therefore, if the images in the low coverage like the test pattern No.16 are printed enormously, it causes the overflow toner or image deterioration.
- When printing a number of test patterns in the low coverage in the adjustment mode, be sure to print a hundred of images in the high coverage to consume the toner and pay attentions to the image deterioration.

3. ADVANCED OPERATION

3.1 When the mis-centering unexpectedly occurs

3.1.1 Checkpoint

- Check if there is a trouble with the paper itself, which is one of the general causes of the unexpected paper misalignment.
 - Are the paper edges not folded?
 - Is the outer diameter of the paper not different?
 - Does the foreign object like the glue for the package not stick to the paper?
- When the malfunction occurs after the jam occurs, it is likely that there are remaining papers in the machine, so be sure to check the inside of each conveyance path.

3.1.2 Centering

(1) Mis-centering detection control

- Centering sensor (PS4) detects the side edge at the front side of the main body and determines the position of the image.
- When the unexpected misalignment occurs, there are 2 causes as follows.
 - When the side edge at the front side of the main body is not properly detected.
 - When the centering exceeds the correction range because the paper is considerably misaligned.
- For the paper whose centering exceeds the correction range, the centering correction value that was applied to the former paper must be used.

Example) Print 1st, 2nd, and 3rd paper, and when the centering of the 2nd paper exceeds the correction range.

Number of papers	Centering amount	Correct or not
1st sheet of paper	4mm	Correct 4mm centering, and output the proper image.
2nd sheet of paper	6mm	Use the data of the former paper that has 4mm centering, and output the image that has 2mm centering
3rd sheet of paper	3mm	Correct 3mm centering, and output the proper image.

(2) When the paper edge at the front side of the main body is not properly detected.

- The centering sensor (PS4) detects the border between the paper and the surface of the guide plate facing PS4.
- If the paper to be used is black or almost black (overlay printing is included), the border cannot be detected and the misalignment occurs during the centering correction. In this case, the correction is turned OFF and the adjustment is only conducted by the position alignment of the paper feed tray.
- In addition, when PS4 and the surface of the guide plate facing PS4 is contaminated with the powder, the misalignment occurs during the centering correction. In this case, they must be cleaned.

(3) When the mis-centering exceeds the correction range.

(a) How to judge if the mis-centering exceeds the correction range.

- Go to [UTILITY] - [Administrator Setting] - [System Setting] - [Expert Adjustment] - [Mis-centering Detection JAM Setting], and select [Detect].

Note

- [Not Detect] is selected as a default setting,

- Execute the print. When the centering sensor (PS4) detects that the mis-centering exceeds the correction range, the operation stops by the jam.

Note

- In this case, the jam code is J-3112.

- Pull out the duplex section from the main body. (Refer to [F.5.9.1 Pulling out/reinstalling the duplex section](#))
- Regarding the paper [1] that stops around the registration section, check the distance "a" at the front side and the distance "b" at the back side. In this illustration, the paper passes through the back side of the main body.

[1] Paper	[2] The back side of the main body
[3] The paper feed side	[4] The front side of the main body
[5] The fusing side	-

(b) When there is a mis-centering with the paper that is fed from the PF-703/706 tray.

If the same mis-centering occurs on the all papers from PF tray /1, /2, /3 during the paper feeding from PF-703/706, it is possible that the PF is not correctly installed to the main body. In this case, conduct the following adjustment.

- PF-703: [I.11.3 Centering Adjustment \(PF\)](#)
- PF-706: [I.12.6 Centering Adjustment \(PF\)](#)

(c) When the papers on each tray are respectively misaligned.

- When the side of the paper is not correctly guided and the mis-centering occurs because the interval between the side guide and the paper is too wide or narrow, conduct the following adjustment.
 - Be sure to press the side guide and the paper rear guide against the paper. (Refer to "5.3 Loadin Paper" in "User's Guide Copier")
- If the different mis-centerings occur with the papers on each tray during the paper feeding from the main body, PF-703/706, and LU-409/410, conduct the following adjustments.
 - The tray of the main body: [I.9.1 Tray Centering Adjustment](#)
 - PF-703: [I.11.2 Centering adjustment \(for each tray\)](#)
 - PF-706: [I.12.5 Centering adjustment \(for each tray\)](#)
 - LU-409/410: [I.13.4 Paper centering adjustment](#)

(d) When the mis-centering occurs during the paper feeding from the PF-703/706 tray (caused by the tilt).

- The paper that is fed from the paper feed unit is so tilted that the registration cannot fully perform the correction and the mis-centering occurs. In this case, conduct the following adjustment.
 - PF-703: [I.11.4 Tilt adjustment](#)
 - PF-706: [I.12.7 Tilt adjustment](#)
 - LU-409/410: [I.13.5 Paper skew adjustment](#)

3.1.3 Skew (Tilt)

(1) Paper skew detection control

- Detects the amount of skew with the paper skew sensor /Fr (PS65) and paper skew sensor /Rr (PS66) of the registration unit. When the amount of skew exceeds the prescribed value (1.0% or 0.5%), the operation stops by the paper skew jam.

Note

- In this case, the jam code is J-3111.

(2) When the PF703/706 and LU-409/410 are not correctly installed to the main body

- The paper that is fed from the paper feed tray is so tilted that the correction cannot be fully performed by the registration and the tilt occurs. In this case, conduct the following adjustment.
 - Main body : [I.5.3.15 Printer Registration Loop Adj. \(Timing Adjustment\)](#)
 - Main body, each tray of PF [I.5.3.16 Printer Pre-registration Adj. \(Timing Adjustment\)](#)
 - PF-703: [I.11.4 Tilt adjustment](#)
 - PF-706: [I.12.7 Tilt adjustment](#)
 - LU-409/410: [I.13.5 Paper skew adjustment](#)

(3) When the papers on each tray are respectively skewed.

- When the side of the paper is not correctly guided and the mis-centering occurs because the interval between the side guide and the paper is too wide or narrow, conduct the following adjustment.
 - Be sure to press the side guide and the paper rear guide against the paper. (Refer to "5.3 Loadin Paper" in "User's Guide Copier")
- When the side of the paper is not correctly guided because the side guide goes down and the paper is skewed, conduct the following adjustment.
 - Make the appropriate interval between the paper from the upper limit position and the side guide.
 - Tighten the guide fixing knob and make sure to fix the side guide.
 - When using the small guide, pay the closer attention and set the side guide.
 - Use parts such as PET when the small guide is in use, envelope guide for PF-703.
 - For PF, use of the middle tray (tray4) is recommended when small size skew occurs.

(4) When the paper is skewed at the PF-703.

- The volume from the lead air and the side air is not appropriate so that the paper is too fanned to be skewed. In this case, conduct the following adjustment.
 - [I.8.2.12 PF-703 air-blow adjustment](#)

(5) When the cause is at the conveyance path.

- When the paper passing the particular place gets skewed, it is possible that there are conveyance troubles due to the guide plate deformation and the roller attrition at the paper conveyance path. Particularly, it is more likely to be caused by the attrition of the registration roller /Up, pick-up roller, paper feed roller, and separation roller. In this case, check the condition of the guide plates and the rollers at the conveyance path.

3.1.4 The trouble with the paper conveyance timing

(1) When the paper leading edge is not properly detected.

When the paper detect sensor is contaminated with the paper powder, it is possible that the sensor makes the wrong detection. It is improved by cleaning the sensor and the sides of the guide plate around the sensor.

(2) When the registration roller cannot ensure the stable supply of the paper.

- Due to the dirt and attrition on the registration roller /Up, the paper cannot be stably conveyed and the time lag occurs.
- Particularly, because PRO 951 apply the EPDM rubber to the registration roller (gray roller), the outer diameter of the roller is deformed when Coated or PrePrinted (not supported by PRO 951) is conveyed.
- Be sure to conduct the roller cleaning when there is a dirt on the registration roller /Up, and replace the roller when there is a trouble with the outer diameter.

3.2 When the particular paper is skewed

3.2.1 Paper types that are easily skewed

The paper types described in the following chart are likely to be skewed.

Regarding the hardness of the paper	Papers that are hard for being bended in the conveyance direction
	Papers that are soft for being bended in the conveyance direction (the extreme case like a 40 g/m ² paper is supposed)
Regarding the paper size	Papers that are less than 166mm in the main scan direction
	Hard papers that are less than 180mm in the sub scan direction

3.2.2 Checkpoint and handling

(1) Checkpoints

- Because most of the skews occur during the paper feeding from the tray, be sure to check "[Q.3.1.3 Skew \(Tilt\)](#)".

(2) Regarding the hardness of the paper

- The skew adjustment of 1250/1250P/1052/951 is conducted in such a procedure that the registration roller presses the paper leading edge and creates the loop.
- Regarding the paper that is too hard for the loop creation or too soft to result in a large loop, the correction is not fully performed.
- It can be improved by optimizing the loop amount by conducting "[I.5.3.15 Printer Registration Loop Adj. \(Timing Adjustment\)](#)" and "[I.5.3.16 Printer Pre-registration Adj. \(Timing Adjustment\)](#)" in the service mode.
- If the grain direction of the paper can be changed, set the hard paper by changing the direction so that the softer side of the paper faces in the conveyance direction, and set the soft paper by changing the direction so that the harder side of the paper faces in the conveyance direction. Then, the symptom can be improved.
- Buckling wrinkle or jam may occur when the loop amount is set large to the paper which is too soft and has possibility that the loop grows.
- For the hard paper which is difficult to loop, the loop value is set small to decrease the trails of rollers. In this case, increase a loop without occurring trails of rollers. The paper surely contacts with the roller and the problem released.

(3) Regarding the paper size

- If the width of the leading edge of the paper that is to be pressed against the registration roller is narrow, it is possible that the correction cannot be properly performed. If the paper direction can be changed, change the direction to widen the width of the leading edge of the paper that is to be pressed against the registration roller.
- Regarding the hard paper that is less than 180mm in the sub scan direction, the power for conveyance is insufficient when the paper is pressed against the registration roller. In this case, the loop is hard to be created. If the paper direction can be changed, change it so that the paper length becomes 180mm or more.

Note

- When the paper is pressed against the registration roller, the sufficient power for conveyance is applied because both the V-convey exit roller and ADU exit roller at the upstream side nip the paper.
- When using the paper that is less than 180mm in the sub scan direction, replace the loop roller (AL roller at the drive side: A0G68192/ A0G68193) with the urethane roller so that the conveyance power increases and the loop creation is stabilized.

Note

- However, it is possible that the trails of the rollers is made at the position 106mm from the paper leading edge.

3.3 When the mis-centering is excessive

3.3.1 Checkpoint and handling

- The followings are the checkpoints and handling for the users who cannot fully perform the adjustment.
- If the paper is always (not unexpectedly) misaligned too much, be sure to check the outer diameter of the paper first. The outer diameter of the paper is referred for the image writing, so the variability among the paper outlines directly affects the accuracy of the image positioning.
- When the both sides adjustment cannot be performed in the user operation, conduct the both sides adjustment in the service mode. (Refer to "[Q.2.3.1 Printer Restart Timing Adjustment\(Side2\) rough adjustment](#)" to "[Q.2.3.4 Printer CD-Mag. Adjustment \(Side2\)](#)") The adjustment value that is specified in the user operation is to be added to the value in the service mode for determining the image position. After adjusting the value in the service mode, the value can be finely adjusted in the user mode.
